Your memorialists respectfully submit for your consideration the dangers to which we are so often exposed. The unhealthy nature of our trade—the reports of medical men proving we suffer from diseases to which the other branches are not liable, such as colic and paralysis, and the uncertainty of our employment,—is also so well known that it only requires alluding to to be confirmed.

Your memorialists endeavour to obtain a guarantee that all who belong to this society are skilled workmen. They are united in the hope that by just and impartial conduct in all their transactions they will obtain the respect and goodwill of all concerned. They therefore trust that this memorial will meet with that consideration they fully believe it merits, and that the employers of London will grant the boon of paying us the same rate of wages as the other skilled workmen, viz., Five Shillings and Sixpence for our working-day.

By order of the Executive Committee,

WM. CHAMANT, General Secretary.

GOTHIC ART IN THE INTERNATIONAL EXHIBITION.

IN our last number we noticed briefly the Architectural Gallery, and stated how rich is the display of works produced by the most eminent architects for some years past. Many drawings have, of course, been already exhibited at the Academy and in Conduit-street, but we shall all be glad of so excellent an opportunity of reconsidering them and refreshing our recollections. So varied and so great is the number, that it is most embarrassing to know at what point to commence a notice which we propose to carry on, from time to time, in our columns. We could have wished, indeed, to have had our labours simplified by an arrangement of the designs in the two general divisions of Classic and Gothic. Probably, the difficulties of selection were too great, or the time allowed inadequate. We propose, then, to sift for ourselves the one style from the other, and for the moment we take up the Gothic division.

Beginning in the furthest room, we find on tables along the centre several models. Amongst these, conspicuous from its size, is Lincoln Minster (2145), modelled in cork to a quarter scale. This is the production of a labouring man, J. H. Anderton, of Bracebridge, near Lincoln, and has occupied the whole of his leisure since 1851 till within the last few months. The details are stated to be executed "from his mind's eye, without plates, model, or measurement." The early portions were done at his own home, but Mr. Vickers, builder, of Lincoln, allowed Anderton subsequently to work on his premises, in order to be near the edifice. The toil of many years being at length completed, a subscription was got up for Anderton by some of the local gentlemen, and through their aid the model has been forwarded to the Exhibition. Shown with it are some eight or nine old corks of bottles, a file, and three ordinary table knives. This, really, seems an instance of ingenuity sadly misdirected. The same exertion applied to his own calling would have saved the man from the eleemosynary subscription set on foot for him. He has a large family, and nothing to depend on but his own labour, and we cannot help thinking that if he had expended on his proper employment—of which, by the way, we are left in ignorance—half the energy and perseverance here shown, he would have been in a very different position from that which he now holds as the result of ten or eleven years' cutting up of old corks. As a model in such a material we admit that the work is creditably executed. The interior arcades are shown as well as the exterior, with its boundary railing and chapter-house, and the windows are even filled with representations of painted glass. We foresee plainly that this model will be popular, partly from familiarity with the building, and partly because this is the sort of thing that always impresses general visitors. It was an astute person, and one who gauged pretty accurately the public mind, that thought of showing the knives and the corks, which would have been used if they had been required. There is evidently a virtue in the tools employed. We are most of us familiar with the street model of a ship and the sight of the knife that did it all. Some one else thinks it essential to press this point in a model of Christ's Church, Ealing (2141), which (we are kindly informed) is "constructed in Bristol cardboard with a penknife, from perspective drawings by the architect." Curiously enough the modeller is a dentist, and he announces that he gives lessons in the art by appointment.

Salisbury Cathedral (2136) is shown according to the original design, without tower and spire. Mr. J. B. Robinson exhibits a small stone model (2139) of an ugly monument erected to the memory of the Rev. J. G. Pike, founder of the Baptist Missionary Society. Octagon-shaped, the sides having Pointed arches enclosing trefoiled panels, it mounts into a spiral top, and looks like a miniature tower, which has settled down, to the belfry stage, into the two square steps on which it stands.

Turning now to the walls, we find (1872) a frame of four—Mr. W. E. Nesfield's—eleven pencil sketches from France. One of them is the tympanum of the great doorway of Chartres Cathedral. From Mr. Nesfield's former appearances at the Architectural Exhibition we are aware of the enthusiasm which he feels for Mediæval art. His spirited pen-and-ink drawings have been, we believe, hitherto unexecuted designs belonging to the catalogue of "rejected addresses," which train a young architect in the way of patience and of hope deferred. Here (1873) we have the interior of the great hall about to be erected at Combe Abbey, near Coventry, the seat of the Earl of Craven. The mansion, although chiefly erected by Lord Harrington, in the reign of James I., stands on the site of a religious house founded in 1150 for Cistercian monks, and dedicated to the Virgin Mary. This fact is, perhaps, Mr. Nesfield's motive for his treatment of the subject, which fits in with his partiality for the early style. We are shown a thoroughly English hall of Early Pointed character. Enclosed by an arch, springing from short massive nook shafts, is the end window of four lights, each couplet of lancets contained within an arch filled in with a quatrefoil within a circle. The side windows are of two lights. The hall has, on one of its long sides, two fireplaces of the period, wide and open, and sloping upwards. There are shelves at the ends, projected on a single shaft. A passage runs round at the level of the window sills. On the inner wall, across the great end window, is a gallery, formed by small shafts supporting a cornice. The side-tables, cabinets, and chairs, are conceived in the same style. The walls beneath the windows are panelled in oak; above, they show jointed masonry. The roof is of open timber, and framed with double collars, king-posts, and braces. The upper part is very well, but below the curved braces, which are made to terminate in a straight piece above a carved figure, are not so successful. The whole design breathes the ancient spirit, and we look for mailed warriors in place of figures wearing clothes of the modern fashion. All the accessories are carefully drawn, and Mr. Nesfield would give at the end of the hall a painted (or tapestried) representation of the months by female figures, in breezy gar-

ments, bearing products of the various seasons, and whose names are inscribed over their heads.

Mr. Gompertz sends (1875) a good ink drawing of his florid design for a cathedral, all over pinnacles, and crowded with canopies and crockets. Mr. S. J. Nicholl's design (1879), to which the silver medal of the Society for the Encouragement of the Fine Arts was awarded, is shown in two clever pencil sketches of the exterior and interior. The latter has an ugly roof. A sketch of the decoration of this roof, as proposed to be devoted to the lives of SS. Peter and Paul, has all the defects of lanky figures and inaccurate drawing which it is most undesirable to perpetuate, although abundant precedents are to be found in Early English painted glass. The same architect gives (1880) St. Mary's Cemetery, Kensal-green, as first designed and as actually executed. The latter is much sobered down and reduced in size, and retains but one altar instead of four. The tower has given way to a bell-turret, and the western portal of triple arching to a modest side porch. There was no necessity, surely, for such a doubtful feature in the western gable as a circular window cut into quarters by the arms of a large, plain cross. The dedication to the Virgin, and the fact of the building being evidently intended for Roman Catholics' use, would have amply justified a vesica panel enshrining the Holy Mother and Child.

Mr. Irvine, with a far too facile pencil, contributes four studies of architectural and decorative designs (1877). Of these the sketch for a portal is florid German, infected with the vice of interpenetration, and therefore overdone with crockets and panelling. Then there are two Germanised arm-chairs, made solid beneath the seat, and bristling, as to the backs and arms, with carving. If these chairs are intended to be sat in, a rare combination of cushions would be required to make them comfortable. Messrs. Deane and Woodward give several small pen-and-ink sketches (1874), with a plan, of St. Mary's, Tuam, a large and interesting specimen of Irish ecclesiastical edifices.

Messrs. Pritchard and Seddon send a series of photographs, nine of which are devoted to the mansion at Eaton Park, near Stratford-on-Avon, the seat of Evelyn Philip Shirley, Esq., M.P. for South Warwickshire. This is one of the most remarkable buildings yet achieved in Gothic. Every part of the design shows the most careful thought. Somewhat irregular in plan, the entrance front shows a *porte-cochère*, gabled on the three sides over Pointed arches stayed with angle buttresses. Above these arches is a weathered niche containing an angel, who holds a shield with heraldic bearings. Right and left of the entrance is a cloistered corridor leading to the drawing-room and dining-room. The drawing-room portion projects considerably and forms a wing, terminated with a well-proportioned bay window of two stories. The building is Early Pointed in style, and treated most effectively with plain and trefoiled arches, dog-tooth, and other characteristic ornament. The windows throughout are divided by pillars with foliated capitals, and open with sashes. The walls are coursed with stones, irregular in size, and banded at intervals with a darker stone (or marble). All these photographs will repay a careful examination. They were taken before the scaffolding was entirely removed, and in some instances show the masons at work. The whole of the carving is excellently and spiritedly done, and the building generally must have been a real labour of love to all concerned. The cultivated taste of the owner is to be recognised by the introduction of carved panels, and of several coats of arms, prominent amongst which are the two coats borne by the knightly family of Shirley. The more ancient, *Paly of six*, we notice over the garden porch, with the motto, "*Loyal je suis*." Elsewhere is the present Shirley coat (dating anterior to Richard II.), *Paly of six, a quarter ermine*, sometimes impaled with the wives' coats. A horse-shoe, the badge of Ferrers, is freely used as an ornament on the square part over the abacus of the capitals, and as the centre of the cinquefoils which fill up the space formed by the intervening floor. In addition to these photographs there are others of sculptured panels, designed by Mr. H. H. Armistead,* and containing seven subjects illustrative of events in the history of the Shirley family. One of these shows "Sir Thomas Shirley's encounter with the Saracen—(origin of the family crest).†

In this particular instance a certain fitness is discoverable in the employment of a style commemorative of so ancient a family. Indeed, if we are to have Gothic for domestic buildings, this design seems well suited for the purpose. It proves how absolutely necessary it was to discard the mullion, which always found a place in the earlier attempts at treating modern Gothic. A building such as this would have been impossible in the age to which its style is referable, and yet it is a faithful rendering of all those peculiarities of detail, moulding and ornament, which form the union of grace and gravity which distinguish Early English. By the same architects, and also of early style, are Llandaff District Probate Registry Office, St. Kagan's Rectory, Glamorganshire (1900); Llandough schools (1902); and Llandaff schools (1904). For Llandaff Cathedral are shown the pulpit and organ (1901), and sedilia (1903). The latter have four seats, in the canopied heads of which occur the letters A and Q, and the sacred monogram I I I S, with the passion flower and other emblems.

In our notices of the Architectural Exhibition we remarked on the small scale on which Mr. Truefitt appeared. We might have supposed that he was reserving himself for South Kensington. Here, accordingly, we find him in great force, with a gigantic frame (1998) holding an *olla podrida* of works executed in thirteen counties, which are ranged alphabetically, and ingeniously enumerated on a placard in the foreground, to which a

boy is putting the finishing stroke and directing the spectator's attention. We fancy that we remember in Conduit-street, from the same hand, the humorous plan of pasting this important notice over other placards. Now we are able to make out the words "Great Exhibition," and "Octoroon." It would be hopeless to describe within our limits the contents of the picture, and we can only touch on some leading features. Beginning on the extreme left we have a yellow brick house (and shop) at the corner of Burlington-gardens, and next to it the temporary chapel erected in Islington (if we remember rightly). This is shown, in section with the congregation seated. Then we run over the boy before spoken of, and trampling down some flowering plants growing gaily over graves, adorned with headstones and ironwork, we rap at the bank doors of Cunliffe, Brooks, and Co., of Manchester. We recognise the Manchester font and cover, the Bentinck Memorial, with other works, among the structures which rise gradually on either hand up the hilly slope in the background. In the middle distance is an octagonal tower, lit in the belfry stage by single-light circular-headed windows, and covered with a spire which, in about a third of its height, is cut out with two curved brackets filled in with louveres, and from that point becomes square.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE annual meeting of this body was held at the rooms, 9, Conduit-street, Regent-street, on Monday evening, WILLIAM TITE, Esq., M.P., F.R.S., the President, in the chair. At this meeting, after a ballot, the following gentlemen were declared to have been duly elected office-bearers for the ensuing year:—*President*, Mr. William Tite, re-elected; *Vice-Presidents*, Messrs. G. G. Scott, R.A., Arthur Ashpitel, and O. Jones; *Honorary Secretaries* (in room of Messrs. James Bell and T. Hayter Lewis, resigned), Messrs. C. F. Hayward and J. P. Seddon; *Honorary Secretary for Foreign Correspondence*, Mr. F. C. Penrose, re-elected; *Ordinary Members of Council*, Messrs. E. M. Barry, J. Fergusson, R. Kerr, W. Slater, G. E. Street, J. B. Waring, W. Burges, T. Hayter Lewis, Wyatt Papworth, and J. L. Pearson; *Treasurer*, Sir W. R. Farquhar, bart.; *Honorary Solicitor*, Mr. Frederick Ouvry, F.S.A., F.R.S.L. Queen Anne-street, Cavendish-square; *Auditors*, Mr. William White and Mr. William Lightly. Votes of thanks to the office-bearers of the last year were agreed to. The annual report and balance-sheet (which we shall publish hereafter) were read and adopted.

SHOP IN THE STRAND.

THE building, 31, Strand, of which we give an illustration on another page, is Elizabethan, of red brick, with Portland cement dressings, with a frontage to the Strand of 20 feet, and a return in Villiers-street of above 50 feet. The spandrels are filled with military and naval trophies, as expressive of the trade carried on. The building was recently erected by Mr. J. M. Macey, builder, of Milford-lane, under the direction and from the designs of Mr. John Barnett, of Verulam-buildings.

PROFESSOR DONALDSON ON OBELISKS AND MONOLITHS.

ON Tuesday evening, before a numerous audience, Professor DONALDSON delivered a lecture "On the Transport and Erection of Obelisks and other large Monoliths, in Ancient and Modern Times," in the Great Gallery of the Architectural Exhibition, Conduit-street, Regent-street. The chair was occupied by Mr. JAMES FERGUSSON, and the lecture was illustrated by a number of drawings, as well as models of two Egyptian obelisks, carefully prepared by Mr. Bonomi, and a model of the apparatus employed for the removal, from the Seine to its site, of an obelisk presented to the French Government by the late Mehemet Ali, Viceroy of Egypt. Owing to a pressure of matter we have not space this week for the whole of the talented and interesting lecture, which we are unwilling to divide into portions, but in our next shall give it at length.

CONVERSAZIONE OF THE SOCIETY OF ARTS.

THE first of a series of *conversazioni* to be held under the auspices of the Society of Arts during the continuance of the Great International Exhibition, took place on Wednesday evening, at the South Kensington Museum. Notwithstanding the unfavourable state of the weather, there was a very numerous attendance, including a large number of foreigners.

SOCIETY FOR THE ENLARGEMENT, BUILDING, AND REPAIRING OF CHURCHES AND CHAPELS.—At the last monthly meeting of this society grants of money, amounting to £2,290, were made in aid of the following objects:—Building churches at Langton-green, in the parish of Speldhurst, near Tonbridge-wells; St. Paul's, Clerkenwell; St. Paul's, Stratford, Essex; Tor Mohun, near Torquay; and Waterside, in the parish of Chesham, Bucks, rebuilding the churches at Cowbit, near Spalding; Hunstanworth, near Blackland, Durham, and Monkton, near Honiton; enlarging, or otherwise increasing the accommodation in the churches at Charlestown, Manchester; Llandough near Cowbridge; Long Buckby, near Rugby; and Nevern, near Newport Pembroke; and the grants formerly made towards building the church at Byker near Newcastle-upon-Tyne, and towards reseating the churches at Combe St Nicholas, near Chard, Outwell, near Wisbeach, and Tetney, near Grimsby, were increased. The society accepted trust or repairs funds for the churches of St. Paul Broomfields, in the parish of Bradford; Whitley, in the parish of Kelington, Yorkshire; and All Saints' Church, Chardstock, Somerset. It was announced that, since the last meeting, the sum of £1,854 had been received as the legacy of the late Miss Mapletoft, £500 as that of Thomas Barber, Esq., Cheltenham, and £14,530 from John Hine, Esq., of which latter amount one third is to be restricted to the building and enlarging of churches in the county of Devon. Other donations have also been recently received.

* The original drawings for these are to be found among the art-designs for manufactures (2824).—Class xxxviii. a.

† A Saracen's head, couped at the neck, proper, wreathed about the temples, or, and azure.—Burke.

MR. FRITH'S "RAILWAY STATION."

HAVING, in a former number, given a description of the leading parts of this picture, as regards what may be called the story, we propose, as it will doubtless attract a great deal of public attention, to make a few observations on its artistic merits, and the rank it should take in art.

It is not with the intention of being over critical, or for the purpose of raising a dissection, that we call this production a painting and not a picture. That it is a painting no one can deny; but that it is a picture, we, among others, may dispute. A picture, in the strict sense of the word—that is, in an artistic sense—is the representation of an event at a chosen moment by the painter, as momentarily to be perceived at the first glance by the spectator. Now, as there are nearly one hundred persons in the painting of the "Railway Station," all differently occupied, it is clear that, although all their actions, and the events in which they are engaged, could take place at the same moment, it is as clearly impossible that the spectator of either the scene or the painting could or can distinctly perceive them all at a single and a momentary glance. Therefore, we think it right to explain that this work is not a picture but a painting, and to state that it takes a peculiar position in the classification of works of art. It also belongs to a class of art for which we have no convenient nor expressive name. The general success of such productions might suggest the word "popular," which, upon the whole, is, perhaps, preferable to the vague word *genre* used by French critics; for this is not an ordinary subject—never having been painted before—although all the incidents are either of frequent or of occasional occurrence; therefore, as we have in art the accepted term of "still life," probably that of "every-day life" would answer the purpose. There is, we have observed, an inclination to cavil at the choice of subject, and to consider it unworthy of the great amount of labour, taste and skill which have been bestowed upon it. We, however, think that while a painter does not shock the feelings or violate morality, he is at perfect liberty to paint any subject whatsoever that he feels may be made available for pictorial representation. When, therefore, an artist paints that which comes naturally to his ordinary train of thought and within the range of his executive powers, it is almost unnecessary to assume that it will prove to be more successful than if he indulged in subjects far above the highest conception of his mind, and as far beyond the scope of his delineative skill. That the subject of the "Railway Station" is perfectly congenial to Mr. Frith's mind we may safely conclude from his success in its execution, and the similar success which attended his "Ramsgate Sands," and his more recent painting of the "Derby Day." All these paintings have given harmless pleasure, and will continue to do so to thousands for years to come; they are a perfectly legitimate occupation for a talented painter; and as they are painted upon perfectly legitimate principles, we can discover no reasonable ground of complaint against the choice of subject, nor of regret that the genius of the artist has not induced him to starve upon grand historical illustrations, sacred or profane, and to find comfort in public neglect. Much more praiseworthy is it to paint a "Railway Station" in the highest perfection the nature of the subject will admit, than to degrade, if not profane, sacred subjects for the mere purpose of astonishing gaping crowds, and with the sole aim at the exact imitation of archaeological curiosities. Besides which, while the desecration of a religious event may rank in art above one of every-day life, the latter may have a moral advantage of which the former cannot boast. In the two last paintings by Mr. Frith we have warnings for evil-doers; in the "Derby Day" there are the results of gaming and debauchery; and in the "Railway Station," besides some of the affections and sentiments of life, we are shown the haggard and careworn forger, or wily and dangerous swindler, seized at the very moment he thought his escape secure; and we see the consequences of low company and irregular living in the undutiful and unfeeling son enlisted for a soldier, upon whose shoulder his widowed mother weeps. If, therefore, the moral lesson such incidents inculcate be duly appreciated, paintings of this kind really do take a much higher range than when considered merely as objects for public amusement.

With respect to the treatment of such subjects as we have endeavoured to explain, although it is possible all the events represented might take place at the same moment, it is quite impossible that a spectator would perceive them all at that identical moment, either in the reality or on the canvas. As the painting is so much longer than it is high, the upper and lower part of the visual circle would extend far beyond the top and bottom of the frame before the whole subject could be brought within its circumference, the spectator must consequently take his stand too far off to see either distinctly the figures or clearly understand their actions. It induces the necessity of close inspection, and the examination in detail of not only every group but of every figure in each group. Thus, being brought closely to the subject, it is absolutely essential that each object should be perfectly executed, and hence finish and detail, which would be out of place and in bad taste if found in a picture to be seen at a distance and at a single glance, are consistent and unavoidable in a work as extensive as "The Railway Station." That being undoubtedly so, the next question arises as to how that exact representation has been executed; that is to say, whether the objects are painted with so free and perfect a hand that the resemblance is more apparent than the labour which produced it; whether the countenances are sufficiently natural not to show inefficient effort; whether the features have the true expression and probable motion; and whether the figures act, their dresses set and blend with the whole, so as not to stand stiffly from the rest, and not in any instance to remind the spectator of either labour, study, or the lay figure. In all and each of these respects Mr. Frith's "Railway Station" is perfectly satisfactory.

As it is not pretended that unity of impression is the leading characteristic of the composition, but, on the contrary, its adopted principle is detached groups of figures engaged in the expression and manifestation of different feelings and sentiments, each group entirely apart from the others and the bond of union which binds the whole arrangement together and gives singleness of purpose to all the persons assembled on the platform of the railway, is the supposition that most of them are about to start by the same train, and those who do not intend to do so are busily engaged in preparing to expedite that departure, it follows that each division of the painting, which includes several groups, may be very conveniently described in a separate form.

Mr. Frith has displayed much judgment in selecting a high and wide arch of the station beneath which to place his most numerous assemblage of persons. This enables him to give importance to the nearly central portion of the composition, arrests the eye, carrying it upwards, and thus prevents it from being too sensible of the long lines of the train and the roofing of the building. Beneath this, the most elevated part of the station, arc—a foreigner, with his wife, disputing the cabman's fare; the father and mother with their boys going to school; the porter collecting the luggage from the pavement; behind whom are the sailors going to join their ships; the recruiting sergeant holding up his little child, with the recruits standing around him; above these are the railway porters, one handing up luggage to another who receives it on the roof of the train; above him floats, in small clouds, the steam from the safety-valve of the engine; and above all is seen part of the sky-light, which, unconsciously to the ordinary spectator, but most skilfully and effectually, not only carries the eye to the apex of the group and keeps it from wandering too readily towards the extremities of the subject, but actually connects the top of the painting with the carpet-bag and the other luggage nearly touching the frame at the bottom of the canvas. This central arrangement is well sustained by the strong contrasts of light and shade, and the richest portions of vivid colours being placed on the foreground of this large group. The height of this part of the composition being thus obtained, the relief and solidity towards the base of this artistic pyramid are effected by the black silk cloak of the woman attending to her hand-boxes being brought in strong opposition to the pure white of the shawl worn by the mother stooping to kiss her boy going to school, and the dark side of the group gets relief from cutting against the largest mass of white produced by the light dresses of the wedding party. The white dresses of the wedding party receive point and contrast from the little boy consoling his weeping sister, wearing a velvet dress of rich and dark green, while relief is provided by the warm neutral tint of the railway carriage behind. This group is separated from the next attractive incident in the composition by the deep and warmish-toned dresses of the detectives, who arrest the supposed forger as he steps into a carriage, whose livid face—something whiter than his light drab overcoat—attracts the attention towards that side of the painting, and the sombre dress of the guard who holds the carriage door open prevents the colouring from cutting too severely against the edge of the frame, and directs the eye to the prisoner's unhappy wife, who has seen the arrest and has risen to follow her husband as far as the indulgence of the detectives will allow. It is on this part of the picture that the artist has bestowed the most effective combination of facial contrasts, and very properly so, because it is on this spot that the most pathetic and moral part of the subject is developed. The haggard and careworn visage of the criminal, seized and brought to justice, when, a minute or two later, would have, perhaps, enabled him to reach a foreign clime, and live in such peace as constant anxiety and restless uncertainty would permit him to enjoy. The fear-stricken face of this man is turned towards the complacent and blandly smiling detectives, one of whom lays his hand on the culprit's shoulder, whilst the other produces the handcuffs to secure his arms. The terror and cadaverous face of the arrested man is still further contrasted by the calm and unconscious look of the old gentleman immediately above and behind him, who is comfortably seated, and intently occupied with his morning paper, between whom and the motionless attitude and official composure of the guard holding the door open on the other side is placed the weeping and terrified wife. There may be no great novelty in the event here depicted beyond a powerful illustration of a fact we occasionally read in the newspapers; but, while contemplating the scene, we experienced a strange feeling excited in our minds which seemed to invest it with a kind of dread, in comparison between the remarkably nice and well made clothes, the brightly-shining new hats, and the healthy, composed, and smiling faces of the detectives, and the terrible nature of the duty they are so blandly executing, and the awful consequences with which it may be terminated. There is something inexpressively painful in seeing for the first time that the catching of criminals is so profitable as to enable men to make so respectable an appearance, and to think that their success in life depends upon placing their fellow creatures in a prison, the only outlet from whence would be perhaps to perish on the scaffold.

Passing to the other side of the centre group, the interest subsides more into common-place. There is the hot and fussy woman, who is always fancying herself too late, impeded by a railway porter, wheeling an immense quantity of luggage; single men with their fishing-rods and gun-cases; a feeble old man assisted by his daughters; a bookworm; a game-keeper coupling a brace of setters previously to their being placed in the dog van; and, finally, an old lady and her daughter endeavouring to save their little pet poodle from the rough usage it is likely to meet with among the rest of the dogs by being allowed to take it with them, but all to no purpose, for the official seems to say, "We have our orders, and must obey them, mum." Some regret has been expressed that the colouring of

the roof of the station by Mr. Owen Jones no longer remains. We, for our part, after reconsideration, are well pleased that it has been removed, or the artist might have had still greater difficulty to contend against than he has had. The warm neutral tint which now pervades the upper part of the building is admirably managed to prevent the eye from being attracted away, and confines attention to the platform and the train.

Of the colouring we may briefly state that it is arranged with the same skill and learning that distinguishes the arrangement of the groups, and the execution is bold, free, and equally sustained throughout, with, perhaps, the exception of the rather crude state in which the dogs are pencilled on the extreme left; but, as Mr. Frith is not a professed painter of animals, the exception of unfinished is just enough to prove the rule of perfect elaboration. In all other respects it will, in little or no degree, detract from the well-established fame of the artist. For the sake of giving an instance of the freedom and firmness of execution, combined with close imitation of texture, we will direct attention to the painting and graduation of tint, as well as to the exact resemblance to the reality, of the lady's shawl in the foreground, stooping to kiss her son before he leaves for school; and as to harmony of colour, the bronze tone of her silk dress forms an excellent combination with, and contrast to, the colour of her shawl. This painting, in the branch of art to which it legitimately belongs, is a perfect success, and will prove an equally successful speculation.

PROGRESS OF THE METROPOLITAN MAIN DRAINAGE WORKS.

AT the last meeting of the Metropolitan Board of Works, held at the offices, Spring-gardens, on Friday, Mr. BAZALGETTE, Engineer-in-Chief of the Board, reported that during the spring of the year it is always difficult to obtain a sufficient supply of good bricks, and more particularly so when the season is wet, as the old stock is nearly exhausted and the new bricks have not come into the market. The Main Drainage Works have to some extent been retarded during the past month from this cause, although on the whole the progress made is tolerably satisfactory. The works, under Mr. Furness's contract, for the Northern Outfall Sewer are still conducted with great energy, and progress more rapidly than any of the other contracts. The ironwork for the aqueducts over the River Lea, the North Woolwich, and the London, Tilbury, and Southend railways is being tested, fitted and riveted, and the ironwork for all the other bridges is now delivered on the ground. The iron bridge over the road near Plaistow is finished, and the tunnel under the Eastern Counties Railway embankment progresses satisfactorily. The concrete embankment is completed for about three-fourths of the entire length of the sewer, and about 3,300 feet of the arching or aqueduct across the marshes have been finished. The total value of the work done up to the present time is about £257,000, so that the contract is now nearly half completed. Messrs. Brassey and Co. have been much retarded in the execution of the Middle-level Sewer contract, by the necessity for stopping the works in Oxford-street during the summer months, coupled with the stoppage of Holborn, and the consequent diversion of the traffic through Ligonier-street and the King's-road, &c., which form the line of the intended sewer, and further by the want of a diversion of the water of the Ranelagh sewer to enable them to proceed with the works in the Uxbridge-road, between Albion-street and the Grand Junction-road. This diversion has, however, now been effected. About 5 miles 400 feet of sewer, varying in size from 4 ft. 6 in. by 3 ft. to 12 ft. by 9 ft. 6 in. have been completed, at an estimated cost of £120,000. The works at the junction of the Ranelagh Storm Overflow with the Middle-level sewer in the Uxbridge-road are being pushed forward as rapidly as possible, with a view to immediately re-open the main road. The value of the work done under this contract is about £28,500. In Mr. Webster's contract for the Southern Outfall Sewer about 700 feet of sewer only remain to be finished, and the value of the work executed amounts to about £290,000. The Southern High-level Sewer works progress slowly; the cost of the work done is about £150,000, and about one mile of sewer remains to be constructed. Mr. Pearson has completed about 1,480 feet of the Southern High-level Extension Sewer, at an estimated value of £2,134. Messrs. Aird and Son are making good progress with the Deptford Pumping-station, and are ready for the reception of portions of the machinery, which will be delivered by Messrs. Slaughter and Co. in the course of the ensuing month. The value of the work executed by Messrs. Aird is £73,000. Mr. Dowse is progressing with the Southwark new street, and has completed about 2,000 square yards of paving, 930 feet lineal of subway, 1,142 feet of 3 feet 9 inches by 2 feet 6 inches sewer, and 163 vaults, at an estimated cost of £10,800.

THE HOLY SEPULCHRE.—The *Monde* publishes a letter from Jerusalem of the 27th March, in which, referring to some observations previously made on the dilapidated condition of the cupola of the Church of the Holy Sepulchre, it states that on the occasion of an accident which had happened to a pilgrim from the fall of a portion of the ceiling, it has reason to believe that the Cabinet of the Tuileries has called the attention of the Sultan to the subject. Whatever may have been the steps taken at Constantinople, it is certain that the Governor of Palestine has lately received instructions from the Ottoman Minister to take measures to prevent accidents to pilgrims in their visits to the church. An examination of the cupola has consequently taken place, and architects have expressed their surprise that the whole of the dome had not fallen in during the tempests of the past winter. The result of the consultation is, that the restoration of the building is declared to be a matter of urgent necessity.

DISCOVERY OF GREEK ANTIQUITIES.—A letter from Athens announces a discovery which has just been made by Mr. Starek, an English architect, and member of the archaeological commission sent to Greece. Researches which Mr. Starek has caused to be made at his own expense have brought to light the ancient theatre of Bacchus, upon the southern slope of the Acropolis. After eight days' unsuccessful labour, when all hope was abandoned, the first step of a staircase was discovered, and by degrees the whole site was laid open to a depth of seventeen feet.

WINCHESTER.—Workmen are engaged in pulling down the College tower, which has long been in an unsatisfactory state, and has recently been shown to be dangerous. It is to be rebuilt on the same site. The tower was erected by Warden Thurbarn, about 1478, and is a century later in date than the chapel which it adjoins.

ARCHITECTURE OF PALESTINE, FROM THE EARLIEST TIMES TO THE CRUSADES.*

EPOCH OF HEROD.

HEROD struggled all his life long to secure the title of *the Great*, yet he was nothing more than the magnificent slave of the Romans, who allowed him fetters of gold. But from the country and posterity he well deserves the epithet great, in consideration of the sumptuous monuments erected by him. Little does it matter to us, in our examinations, that they were proofs of his servility or his ambition. Let us proceed to examine them. Some masses of ruins, some trunks of columns, walls, solid foundations, sepulchres, built or embellished, and the basements of towers, but no one entire edifice, nor any ornamented one. It is undeniable that Palestine is a sepulchre of edifices as of individuals.

In Jerusalem we find, belonging to this glorious epoch, some portions of the wall surrounding Moriah, on the eastern and western sides; the entire plan of the construction of the Phazaelus; some few remnants of the solid masonry of the tower of Psephinus; the remains of two others which flank the north gate; the existing sub-basement of the Damascus Gate which I discovered in March, 1861; finally, the embellishments added to the sepulchres of the Valley of Jehoshaphat, to the north and south. Of all these, mention has been made by those who have written upon Jerusalem down to the present time. Little, therefore, remains for me to say, and I will be as brief as possible. I accept the opinion of Mr. Williams respecting the tower which remains on the west of the castle of David, and that of Phazaelus on the east. The latter preserves the architectural type of a Herodian tower, as described by Josephus (Book V. iv. 2). It is based upon the rock, which rises 5 feet above the level of the ground, and is covered with masonry of large rusticated stones. Here I observe that Herod in his fortifications made use of the Solomonic level, as I could plainly perceive in Herodium, Cesarea, and other places. The Jewish wall rises 38 feet 6 inches above the side of the fosse. Each course of stones recedes by five lines from the base upwards. I would, however, remark that in the interior it is 11 feet thick, relatively to the upper level of the east trench, which is 14 feet deep, and measures forty cubits on each side, reckoning the cubit at about 18 inches. It is then the same tower of Phazael described by the historian who tells us that Titus (Wars of the Jews VII. xi.) would have it preserved to show the kind of towers that fortified the city which he had taken by his armies. Some may object that Josephus mentions a cistern, and this is not to be found. But would it be possible to preserve it, in accordance with the system of fortification in use in the middle ages? I think not. I meet with nothing in opposition to the idea that the cistern was destroyed in order to gain a clear space of about 20 cubic feet, which would be valuable when soldiers required to be lodged there. It is unnecessary to draw attention to the other towers which flank the Damascus gate, and which I discovered by means of excavations. With the exception that they are of smaller dimensions, the differ in no respect from those already described. I may, however, say that the gate which I discovered, and which I call the north gate (Josephus, Wars of the Jews, V. xli.), is 12 feet wide and 26 feet high, with a round arch. The stones composing the jambs and the arch are of large dimension. This discovery is not so important in an architectural point of view as on account of the ancient city walls of Herod's time. It is one of the most interesting points in support of my opinion, that the walls on the north did not extend beyond the present walls. Not to dwell for ever upon the subject of walls, I will avoid going further into the matter here; but I will remark that the ancient portions on the eastern side of Moriah, like those at the Jews' waiting-place, appear to me to bear the Herodian character. I am far from adopting the opinion of M. de Saulcy, member of the Institute of France, who believes them to be Solomonic. Their construction shows great perfection, on account of the beauty of the materials employed, the regularity of their arrangement, and the vertical joints which rest upon the middle of the corresponding stones in the lower and upper courses; nothing of which is seen nearly so admirably executed in the walls styled Solomonic. In the latter, artistic genius just developing itself is observable; in the former, genius seems to have attained its full growth.

The Golden Gate, to the east of Moriah, is judged to be Herodian from its ornaments; but I am not of that opinion. I know that the temple and its walls were destroyed by the Romans, and it seems to me impossible that this gate, with its ornamentation, should have escaped the devastation. Its jambs are formed of stones square and not levelled. They of themselves, therefore, furnish proof of having been mortised in the old wall. The ornamented arches are cased with Roman masonry. How, then, is it possible to suppose them Herodian? Those who take this view do so because the lintels and architraves of the doors are formed of enormous blocks. It is true that this material is Herodian, and this has led to the erroneous induction. I believe that these blocks are remaining portions of the ancient Eastern gate, and that to them the more recent construction has been applied, formed upon the same plan as the ancient gate. I think so because the foundation walls have been discovered, and because it is said in the Mishna that the Eastern gate was 40 cubits long and 20 cubits wide, and these are exactly its dimensions.

We will now visit the sepulchres in the neighbourhood of Jerusalem. I unhesitatingly confess that I believe the ornamentation of all of them to be of later date than their original construction, and am of opinion that it was added during the Herodian period. I might maintain that the sepulchres of the kings were formed by order of that great sovereign for himself and his descendants, but what proofs have we in support of this idea? I hope M. de Saulcy will not hear me, since he attributes them to the era of the kings of Judah, to which epoch it was necessary that he should trace them, when he was pleased to characterise the sarcophagus taken from them as that of David, in order that he might deposit it in triumph at the Louvre, in Paris. By parity of reasoning I have met with the sarcophagi of Solomon and Rehoboam, one of which is, in fact, broken into fragments, while the other serves as a receptacle for water in the Hall of Justice at Jerusalem.

Let us now examine some of the sepulchres in detail. That of Absalom is a cubical monolith, measuring 21 feet on each side. Ionic columns support an entablature with ornamented Doric triglyphs and pateras. Above this frieze is an Egyptian cornice, at which point the monolith ceases. The whole of the upper part is in masonry. It is composed of a square dado surmounted by a cylinder, which is terminated by a torus, representing an enormous twisted cable; the whole is completed by a kind of pyramid of curved conical form, finished with a bouquet of

palm leaves. The total height of the monument is 52 feet. It exhibits, therefore, a mixture of the Greek and Egyptian styles.

Herod was of Idumean origin, it will be remembered. In Idumea are some monuments which recall Absalom's to mind. At the north-west corner of the vestibule, cut in the rock which surrounds the tomb of Absalom, is a rich pediment, ornamented with acroters and foliage. That of the Jews to the north of Jerusalem is of the same description.

The outer portico of the Sepulchre of Saint James is supported by two columns and two demi-pilasters of the Doric order, connected by an architrave, above which is a Doric fascia, ornamented with triglyphs and surmounted by a cornice. In the Haeledeina, to the south of the city, a fac-simile of this is seen. The Sepulchre of Zachariah is a monolith, each of the sides of which measures 18 feet in width. It is ornamented with two columns in the centre and two half columns inserted in a pilaster at the angles. Above is a simple architrave, surmounted by an Egyptian cornice, like that of the Sepulchre of Absalom. The whole is surmounted by a quadrangular equilateral pyramid. The total height of the monument is 10 feet. It is to be observed that the eastern side still shows the rough hewn work, and on the north it is not completely finished.

To visit the Sepulchres of the Kings, a court must be entered by a door excavated in the rock, ornamented by a simple filled in relief. This is under ground up to the commencement of the arch. At the extremity of the court is a vestibule, formerly adorned in the interior with two columns, which have been destroyed partly by an earthquake and partly by violence. Above the vestibule is a fascia in sculpture. The centre of the fascia is ornamented with a bunch of grapes, now sadly mutilated. On the right and left of this is a triple palm, a wreath of olive leaves and triglyphs, alternated with patera three times repeated. Above these is a garland of leaves and fruits, which droops at right angles from each side of the aperture of the vestibule. Above the line of the triglyphs is a cornice in a very ruined condition. Can this ornamentation have been executed at the period of the kings of Judah? I believe not; but, I err, I am open to conviction. Would that we could find something more satisfactory in Samaria, Cesarea, Antipatris, Herodium, Phazael, and at Castle Cypron, but, excepting some columns, a few ruinous capitals, and immense accumulations of stones, nothing can be discovered of the great Herodian constructions. I therefore turn to a more recent epoch.

PERIOD OF CONSTANTINE.

When the accession of Constantine the Great to the throne had secured the triumph of the Cross, Palestine witnessed a vast architectural movement, and a number of churches were erected in localities rendered celebrated by the evangelical mission of our Saviour. From this cause, in the fourth century Jerusalem attracted the special attention of the Christian monarch and his pious mother, and here was erected a basilica, which silver, art, and precious materials combined to render worthy of their piety and magnificence. I will first describe the basilica of the Resurrection, and then proceed to other monuments, the work of the first Byzantine Emperor. It will, I think, be interesting to my hearers if I give them some description of the Sepulchre of Christ, over which Constantine erected the temple. I cannot stop to consider all the objections brought against the authenticity of the tomb, but will merely observe that the tomb exists, and that I have seen it. In the neighbourhood of the city, particularly on the north and east, tombs cut in the rocks may still be seen. Many are in a ruinous condition, others are more perfect. They are composed of two divisions, the vestibule and the sepulchral chamber; the latter closed by means of a stone of an elliptic form. The evangelist St. Matthew (xxvii. 60) describes an occurrence which may be witnessed in the present day in the same locality:—"And Joseph laid the body in his own new tomb, which he had hewn out in the rock; and he rolled a great stone to the door of the sepulchre, and departed." Christ's sepulchre, as at present existing, is divided into two compartments, the vestibule, in which the guard of soldiers was placed, and the tomb itself, which has a small door of the same construction as those of the Sepulchres of the Kings and of St. Pelagia on the Mount of Ascension.

The religious Greeks, Armenians, and Latins, assert that the whole monument of the present sepulchre is rock beneath the marble facing. I could not discover this, nor do I believe it. Even if it withstood the destruction which befell the city under Titus, and the occurrences of Hadrian's time, we know from history that it was greatly mutilated by Cosroe II. in 614, and by Hakem, Caliph of Egypt, in 1010. But I am quite certain, beyond all doubt, that I saw and touched the rock in the pavement, which rises at the distance of 21 feet to the west of the sepulchre, and in the sepulchre itself, by the longitudinal cutting which is here exhibited. It is essential to remark that all the sepulchres of antiquity are of the same length and breadth, the former 6 feet, and the latter 2½; and in this respect the Sepulchre of Christ forms no exception to others. The disputes would never have arisen if Constantine had not been guilty of the religious vandalism of separating the sepulchre from the rock, on the western side, in order to enclose the sepulchre within the temple, and the further barbarism of adapting the sepulchre to the temple and not the temple to the sepulchre.

The present church of the Resurrection retains none of the elements of the grandeur of Constantine. They disappeared when the invasions of the Persians and Saracens covered Palestine with ruins. The successive repairs to which such portions as escaped have since been subjected have deprived the structure of the characteristics of the fourth century, with the exception of the north wall and the walls and pilasters of the great cupola, which are primitive. The Crusaders, who found the sanctuaries separated, reunited them; and it is their work which is now seen. From their time to the present no change of importance has taken place. On the 12th October, 1808, a part of the rotunda and the Calvary, also a portion of the south wall towards the west, were destroyed by fire. The absurd and unintelligent repairs of the Greeks in many points completed the devastations begun by the flames, and numbers of interesting details of Gothic or Byzantine art disappeared, thanks to the degenerate sons of Constantine the Great. The precious marbles which ornamented the basilica of Constantine were taken by the Mussulmans in the seventh century to adorn their mosques, especially Koubbet-es-Sakhrah. Hence, among the ruins recently removed from the eastern side of the sepulchre shafts of columns have been found, formed of beautiful marble and granite, with capitals in form precisely like the gilded capitals of the mosque. It cannot be supposed because these precious relics are found there that the remains of the mosque, which was never destroyed from the period of its erection, had been carried and placed round the sepulchre and in the vicinity of the south. I am, therefore, compelled to conclude that it is not in the Temple of the Resurrection, but, elsewhere, that we must seek the elements of the period of Constantine.

Let us now turn to Bethlehem. The Basilica of the Nativity at Bethlehem was begun by Saint Helena, and terminated by her son Constantine, between the years 327 and 333 of the Christian era. Some authors have attributed the erection of this monument to Justinian, but a very cursory inspection will suffice to prove that it presents none of the characteristics of the architecture of the sixth century, and that this opinion must consequently be erroneous. It is the oldest and best authenticated monument of Christian art in Palestine. The eye embraces five naves at a single glance. The centre nave is larger than both the two together on either side of it. They are of great length, and formed by four rows of Corinthian monolithic columns, and are composed with eleven intercolumniations (*travée*). The transept is as wide as the centre nave. The north and south extremity terminate in a semicircular apsis with a radius of 14 feet. These apses project beyond the exterior walls of the building. On the east, on the side of the transept, separated by a wall formed by the Greeks, the five naves reappear and form the choir of the church. The centre nave is composed of two intercolumniations and a semicircular apse, equal with those which terminate the transept. The two which succeed, right and left, are terminated by a straight wall which commences at the choir. Owing to this arrangement of the lower sides of the Basilica, the upper portion of the cross is symmetrical in relation to its lateral arms. The width of the great centre nave is 30 feet; the first lateral nave 12, the second 10; so that the total width of the five naves is 74 feet, while the entire length of the centre nave is 180.

The monolithic columns forming the divisions of the naves are 17 feet 3 lines in height; their capitals are Corinthian; that is to say, the proportions only slightly differ from the proportions demanded by the rules generally observed in the time of the Roman Empire. In fact, the column is short relatively to the diameter of the base, which measures 2 feet 6 lines. Besides this, it presents no very distinctive characteristics, but shows signs of the decadence; reposing, as it does, upon a plinth, which measures 3 feet 2 lines on each side. This want of proportion has been supposed by some to have been owing to the inability of the calcareous bed from which the columns were derived to produce monoliths of greater height; but, as the quarries still exist, and I have carefully examined them, I cannot admit the explanation; but rather opine that it is simply the result of the decadence of art. As I have already stated, the diameter of the base of the column is 2 feet 6 lines; the height of the shaft, comprising the base and capitals, is 17 feet 3 lines, and, consequently, the latter is short in proportion to the former. Further, the base has no very decided character. It rests upon a rectangular plinth, measuring 3 feet 2 lines on each side. I may further add that the total number of entire columns is 46, of half columns 18, and that the latter are inserted in the pilasters on the wall, where the rows of columns terminate. In the abacus, all these are ornamented with crosses in relief. In the lateral naves (side aisles) architects support the *armatura* of the roof. In central naves, the walls, which are 30 feet high, are also supported by the architraves, on which rests the great *armatura* of the roof. The roof is not vaulted, but composed entirely of wood. In the upper part the walls contain circular-headed windows, corresponding with each space between the lower columns. The spaces between the windows, and all the rest of the surface of the walls, in the twelfth century, were ornamented with mosaic work. The present roof dates from the seventh century, and the Greeks alone claim the right to repair it. I conclude then, that, this is the only complete work of Constantine which remains to us after the lapse of 1,529 years. This alone has survived every destructive influence, and maintained its ancient characteristics. It is a very striking specimen of Roman genius. The venerable aspect of the edifice, the harmony of its combinations and its original conception, all arouse admiration. It is indisputable that the general plan of the church produces an impression of beauty, not only from its dimensions and the simplicity of its outlines, but because it is the embodiment of an intelligent phase of religious architecture, and thus cannot fail to satisfy the taste and please the eye.

EPOCH OF JUSTINIAN.

The Emperor Justinian, no less ardent than his predecessors in erecting religious edifices, did not forget the Holy Land, but there raised a great number of such structures. All, however, which remain standing as mementoes of him are the basilica of St. Mary, at Jerusalem, now converted into the Mosque El-Aksa; the tower called Justinian's, at Bethlehem, and the ruins of the church of St. George at Lydda—the ancient Diospolis. In other parts of Palestine other religious monuments were erected by this Emperor, but their localities are only indicated by heaps of ruins; the details have vanished, either from the effects of fire or violence, chiefly through Mohammedan fanaticism. The Aksa shows its Christian origin, and Procopius has left us a detailed account of its construction (de A. Edif. Justin. N. 6.) It has in front of it a portico with a vaulted roof, corresponding with the seven naves of the church. The central arch is much larger than those on either side. The exterior and interior present a very pointed arch. The whole building exhibits the well known plan of a primitive Christian basilica. The centre nave is supported by six large columns of *breccia rossa* of Palestine with ordinary Corinthian capitals, somewhat disfigured by incongruous details and ornament. These columns support pointed arches, above which are two rows of windows. The first two lateral naves are supported by square piers, the other four are much lower, of a totally different construction, and appear to have been added at a much later date. In this particular I fully agree with the Rev. George Williams, in his "Holy City," that the mosque was enlarged on the east and west sides by El-Makdi, in 775-785.

In its present state the length is not in due proportion with the width, while in its primitive condition the proportions were exact, and the basilica was in the form of a cross. On the south, the church is terminated by a transverse nave, separated from the grand longitudinal nave by pointed arches surmounted at the intersection of the cross by a cupola supported by four piers, each ornamented with two columns of verd antique supporting Corinthian capitals. The cupola is a dome contracted at the base, which admirably sets off its forms. It is decorated with modern paintings quite unworthy of the edifice, and with mosaics which date from Selim I. and Solymán the Magnificent. The choir was demolished by the Arabs after having been injured by an earthquake, and is now replaced by a simple Arab wall, against which stands the *Milrab*, ornamented with beautiful small porphyry columns. In the transverse arm of the cross the choicest marbles are employed for the light columns, which sustain capitals of various and extravagant forms, dating, no doubt, from the remotest Jewish antiquity, and by no means corresponding with the elevation of the columns. The roof of the mosque is supported by a framing of wood. Such is the result of my observations upon the mosque El-Aksa, which the want of time prevents me from describing in fuller detail.

The Tower of Justinian, at Bethlehem, built for the defence of the Temple of the Nativity, merits some notice. It is square, and measures 97 feet on each side; its height is 122 feet. The walls, which are 22 feet thick, are solid, and built with large blocks, which diminish with each course of stone. The Greeks, who are the possessors of the tower, in the thickness of the walls have made several chambers, which are used for the reception of pilgrims. The largest of these chambers is capable of containing forty persons. I have mentioned this edifice to show that a complete work of Justinian's era exists at Bethlehem, and that, as far as masonry is concerned, it will bear comparison with that employed by Constantine in the basilica of the Nativity. In the latter, the good Roman style is seen; in the tower, the decadence. The church of St. George, at Lidda, the ancient Diospolis was erected by Justinian; of this splendid edifice nothing at present remains but a portion of the walls and the eastern choir, with some magnificent pilasters and capitals. On the south side is a large pointed arch supported by large columns mortised in the piers, and surmounted by Corinthian capitals. A great part of the church still remaining has been converted into a mosque by the Mussulmans. The design which I exhibit will show the date of this monument better than any description.

Epoch of the Arabs.—I do not think it necessary to translate the description of the Mosque of Omar, seeing that it has already been translated for the Mount Moriah.

The whole platform is formed of the rock, which is clearly seen on going into the dwellings of the dervishes and the guardians; as well as in some oratories, and in the cisterns, especially the two on the north of the great mosque Combettes-Sahkrah—the Dome of the Rock. Its plan is simple: two concentric octagonal aisles surround the circular central part, which supports a pointed dome. The form of the dome serves alone to characterise the building. The many descriptions given of its interior prevent me from repeating it, and I shall only remark that its doorways and windows are of Pointed style; that the sixteen columns standing in the inner octagon aisle are of equal height and have the same capitals, but rest on unequal bases, which exhibit very much the characteristics of the period of decadence to which the building belongs; that the twelve columns, which are to be found between the four piers supporting the tympanum of the dome, have a diameter different from the sixteen first met with, as well as different proportions of shaft, capital, and base; and that all these columns support arches slightly pointed. The vaulting of the dome is of wood, covered with Arabic gilding; the tympanum and spandrels of the arches are inlaid with elegant mosaics, which date from the time of the Sultan Selim I. All this induces me to believe, according to history, that the mosque was erected by Abdel-Melik Merwan, in the year 68 of the Hegira, and that its columns of precious marbles and various origin have been taken by the Mussulmans from the basilica erected by Constantine over the sepulchre of Jesus Christ. Constantine alone is well known to have enriched the religious edifices of the Christians with marbles, and history reproduces but too many examples of the spoliation of these buildings by the Mussulmans to decorate their mosques.

ANCIENT ART.

THE first of a course of lectures on the "History of Ancient Art" was delivered by Mr. Newton, at the Royal Institution, on Wednesday week. Mr. Newton pointed out that the basis of all we know of ancient art is the testimony of Pausanias, who travelled through Greece in the second century A.D., and noted the chief famous or beautiful works he then found existing. Pausanias's work is to ancient art what Murray's handbooks to Italy or Greece are to the present state of those countries. Were the remains still extant or above ground, we should have no difficulty in identifying the work of each artist from his description. Unfortunately, however, this is not the case; nearly all has been hopelessly destroyed; some few fragments alone, and these chiefly inscriptions, being built into the walls of churches and other modern buildings, and a few more buried under the accumulated earth of ages, and to be discovered only by the painful and too often unproductive toil of excavation. The ancient temples were the museums of the old people, with this difference, that their contents were unarranged, and consisted of statuary, terra cottas, votive offerings, &c., placed in them from time to time. In our museums, on the other hand, we attempt something towards an historical or archaeological classification, and for this work take Pausanias as our surest guide. Mr. Newton then proceeded to state, that all sculpture may be divided into two great classes—1. Sculpture in the round, with the figures detached; 2. Reliefs, more or less detached, and therefore called *alti* or *bassi*. He added, that Archaic Greek Art (the subject of his first and present lecture) may be conveniently divided into three principal divisions:—1. Heroic and partly Prehistoric, from the earliest dawn of art to B.C. 776 (the institution of the Olympic games); 2. Semi-historical, from B.C. 776 to B.C. 580; 3. Historical, from B.C. 580 to B.C. 478 (the close of the Persian War). The first, or Heroic period, was one in which the people worshipped rude stocks of wood or stone, called *terms*; and the first great improvement, whereby heads, arms, drapery and symbols were more or less intelligibly indicated, was in ancient times attributed to Daedalus—no doubt an *eponymous* name, to indicate the progress of art. Daedalus (or the system he represents) preceded Homer, who alludes to him. Such primitive idols were the Palladium which Diomed stole from Troy, the statue of the Argonautic goddess Chryse, and the original Diana of Ephesus, whose type we know, from the story of Demetrius, the copper-smith, in the Acts, was still being reproduced in the first century A.D. Of these earliest idols (*ζόανα*) none actually have come down to our times; but we have representations of them in works of art of the second or semi-historical period, from B.C. 760 to B.C. 580—such as vases with scenes of the taking of Troy, the Alar of the goddess Chryse; which should be compared with the older coins of Samos, &c. Homer tells little positively, but much negatively, with reference to art. It is clear that very few statues existed in his time, and that the temples were of the humblest kind, neither Doric nor Ionic architecture having been developed so early; but Homer does mention, with much detail, works in metal-lurgy, such as the ornamentation of cuirasses, the shield of Achilles made by Vulcan, the embroidery of Helen, &c. There can be no doubt that he must have seen works similar to those he describes: most likely in the treasuries of different monarchs—such as those of the kings of Lydia, of Atreus, at Mycenæ, of Orchomenos, &c., or possibly stored (as in later times) in some of the temples. These works were reliefs, put together in pieces like the fragments of the Chariot from Perugia in the British Museum, and hammered up (*σφύρηλατα*), not cast in the lump. The peculiarity of the art is well shown in the most ancient vases—a few of which are in the Museum, and more in the

collections of the Mus. Gregor. at Rome and M. Campana; and we learn from these that, as compared with the works of the later styles, the human figure was very little individualised, while the backgrounds were covered with flowers, animals and various adjuncts, and with geometrical patters. The artist, in fact, tried to represent nature as he actually beheld her, with entire absence of aerial effect or perspective. A comparison with the reliefs lately procured by Mr. Layard from Nineveh (and especially with the bronze bowls found by him there) shows clearly whence the early artists obtained their first ideas:—indeed, it is likely that genuine specimens of Assyrian art were preserved, till a late period, in some of the royal treasuries, having been brought to Greece through the commerce the Phœnicians or Carians had with the western settlements of that empire. With the arrangement of the subjects in these vases, we may aptly compare Pausanias' description of the Chest of Cypselus, which he himself saw, and which may have been made about B.C. 750. On this chest (which was probably not unlike the bridal *Cassoni* of Italy) there were reliefs in gold and ivory, arranged in parallel rows, with the names written over the different personages represented. Of the archaic vases, the most celebrated still extant is the so-called François Vase at Florence. This doubtless is much later than the Chest of Cypselus, but still early enough to show a remarkable similarity in style. To this second period belong the two famous artists Theodorus and Rhœceus, the first temple at Ephesus, the establishment of the Olympic and other games, the gradual extinction of the Heroic Monarchies and the introduction of popular Constitutions, and the commencement of Lyric as distinguished from Epical Poetry. The Third or Historical period, from B.C. 580 to B.C. 478, is the teeming period in the History of Art. Then flourished the Seven Wise Men, the first Natural Philosophers, whose influence is felt even to this day, and the greatest and the last of the early historians, Herodotus. Magnificent festivals became common, and Greece put forth her young vigour in the foundation of prosperous colonies, at Cyrene and Marseilles, in Spain and Sicily. During the same period, too, the great early temples of Posidonia (Pastum), Selinus, Ægina, and in Asia Minor, were commenced. It was the cardinal period in the history of Greek art. Then was it that the influence of Egypt (the China or Japan of ancient times) was being felt in Greek art, and the Greek factory at Naukratis was established, during the reigns of the three liberal Egyptian monarchs Psammetichus I., Apries and Amasis. The first of these princes employed 40,000 Carians and Ionians as mercenaries, some of whose names, inscribed by themselves, may still be read on a monument in Upper Egypt; and Rhodes, Halicarnassus, Cnidus, and other cities on the seaboard of south-western Asia Minor, enjoyed a lucrative commerce with Egypt. To this period, too, the artists Dipœnus and Seyllis are assigned by Pliny; and to the latter end of it, such monuments as the Agamemnon-relief at Paris from Samothrace, the figures from Polledrara near Vulei; the seated figures from the Sacred Way at Branchidae, and especially one of these, the portrait of a certain Cares, the ruler of Teiehoessa, which bears his name and titles in very early Greek characters; a lion and sphinx from the same place, together with a very remarkable collection of gold ornaments, vases, and terra-cottas, recently found in a cemetery at Camirus, in Rhodes. Many of these objects, as the statues and lion from Branchidae, have a marked Egyptian character; and it should be remembered that, with the Græco-Phœnician antiquities from Camirus, were found also undoubted Egyptian porcelain and glass, and some genuine as well as blundered hieroglyphics. One cartouche that was found at Camirus bears the name of an Egyptian king, which Egyptian scholars declare must be that of either Psammetichus or Apries. It should also not be forgotten that the Greek writing on the lion from Branchidae, and on the monument of Psammetichus, in Upper Egypt, is identical in style. We also know that two Samian brothers, Teieles and Theodorus, went to Egypt to study sculpture, and we might therefore anticipate the prevalence of an Egyptian influence upon the contemporary Greek style, though we do not find that the stiff architectonic canon of Egypt was adopted by Greek artists. In the case of the relics from Polledrara, Phœnician influence may be readily traced, especially in the relief of a winged lion, precisely similar to those found by Mr. Layard at Nineveh. On the Camirus gold ornaments, too, the Oriental or Persian Arctis is a common subject. In the gradual progress of sculpture, it may be noted how the artists went on from the easiest to the more difficult: first, we have simple upright blocks; then two or more figures draped to the feet, but stationary or motionless; then figures in action; and, finally, pedimental undraped figures, arranged so as to make subjects, such as those from the temple of Ægina, but subordinated to the geometric lines of the architecture. These doubtless date from a little before B.C. 478, which was the great temple-building age, the period when the Doric and Ionic styles were greatly developed, and when, owing to the great popularity of the public games, artists had peculiar opportunities for studying the nude forms of athletes. It was the custom of those times to dedicate in the temples the statues of celebrated victors; and these were, probably, in most cases, made from a careful study of form of the individual athlete. Some instances of these early statues we may still detect on the most ancient coins of Posidonia and Caulonia; on the latter of which Apollo may be recognised, holding a little figure in his outstretched hand. A similar representation of the Apollo, by Canachus, which was carried off from Miletus by Xerxes, may be seen on the coins of that town; a reduced copy, too, of the same statue exists in the Payne Knight Collection at the British Museum.

In conclusion, Mr. Newton stated that the famous groups of sculpture from Selinus were about the same date as the Æginetan pediment, and that it was not improbable that these latter were the work of Onatas, whose groups at Olympia Pausanias himself saw. Generally, the history of Greek Art shows clearly that it was no sudden discovery, but progressed step by step, partly influenced on the one hand by Egypt, and on the other by Phœnicia; and that the characteristics which mainly separate it, as a style, from the colossal conceptions of Egypt are the representation of the human figure in its true proportions, and not agreeably with an arbitrary canon; the introduction of dramatic action; and the combination of groups so as to suit pedimental architecture.

PARTIS COLLEGE.—The Trustees held their anniversary meeting on Thursday last. The business of the day having been transacted, the Trustees, with the chaplain and medical officer of the College, afterwards dined together, in accordance with the desire of the founders, at the York House, Colonel Blathway presiding. Every arrangement having been made by the architect, Mr. Scott, the works connected with the College Chapel will be commenced without delay by the builders, Messrs. Morgan and Lovell, and it is expected that during the summer all will be completed.

SHOP, 31, STRAND.—MR. JOHN BARNETT, ARCHITECT.

LONDON AND MIDDLESEX ARCHÆOLOGICAL SOCIETY.

MEETING IN THE CITY.

A GENERAL meeting of the members and friends of this society was held on Monday, the 28th ult., and was numerously attended. The company, by the permission of the Master and Wardens, assembled at noon at Bakers' Hall, Harp-lane, Tower-street, where the chair was taken by Mr. Alderman FINNIS, who briefly inaugurated the proceedings of the day.

Mr. Deputy LOTT then gave a lengthened history of the Bakers' Company, his lecture being illustrated by old charters, registers, &c.

A conversation followed, and at the close of the meeting,

Mr. HENRY W. SASS, the indefatigable and excellent honorary secretary of the society, exhibited and gave some account of various pieces of antique gold and silver plate belonging to the Bakers' Company.

A vote of thanks to Mr. Deputy Lott and Mr. Alderman Finnis closed the proceedings in the Hall. Having visited the Court-room of the Company, the members and their friends proceeded to the Church of Allhallows, Barking. The company were received by the incumbent, the Rev. JOHN MASKELL, who afterwards read a paper, in which he gave many interesting particulars respecting former vicars of the parish.

Mr. CHARLES HALLY then read the following paper on Brasses and Monuments found in the Church of Allhallows, Barking (which was prepared by Mr. J. G. WALLER, who was unavoidably absent):—

NOTES ON SOME BRASSES OF ALLHALLOWS, BARKING.

Notwithstanding the destruction of the major part of old London by the Fire of 1666, there are still left a few of the ancient churches. These, happily, preserve a great number of monuments, more, indeed, than one might have expected. Of these, Allhallows, Barking, is probably second only in interest to that of St. Helen's, Bishopsgate. The brasses are especially interesting as relics saved from a great catastrophe, and some have in themselves special claims.

I take the earliest to be a coat of arms, party per pale, a fleur de lis, and bordure engrailed, enclosed within a circular fillet, on which is engraved "Pries to l'ame Wilton Tong g' ytt y—Ky diu de sonn alme eyt mercy." It probably belongs to the close of the fourteenth century. The next example worthy of attention is to the memory of John Bacon, a woolman, who died 1437. He is represented by the side of his wife Joan, in the ordinary costume of the time, his feet resting on a woolpack, in allusion to his trade. His wife is not commemorated by any date of decease, so she was the survivor, and without doubt erected the monument. On this view, we assume that the date is pretty nearly that of the execution of the memorial—a very important point in connection with ancient monuments. It is of about the best period for the art of engraving monumental brasses. For if we examine those executed from 1410, and twenty years subsequently, we shall find a grace of execution and a simplicity of design not previously seen, and what is more, that will not be found in foreign brasses of the same time. The most beautiful example of this period is that to the memory of Prior Nelend, at Cowfold, Sussex. Besides this, however, we have numerous instances all over the country. I may instance Cobham, Kent; Beddington and Kingston, Surrey, among these in the vicinity of London; and I wish especially to mention the beauty of drawing that at this period is thrown into the figures of hounds at the feet, for it is scarcely to be surpassed, and it is a strong argument in favour of the indigenous character of the English art that no foreign examples can compete with us in this particular. The heart, on which is inscribed "Mercy," placed above the figures encircled in a scroll, is frequently found so introduced at this period of monumental history. Formerly the heart was considered the seat of the soul and the emotions, and the inscription is probably an invocation, meaning "mercy on the soul." It is sometimes shown between the hands of the deceased, as if the latter were offering it in prayer.

The next to which I will direct your attention is the Flemish brass to the memory of Andrew Eryngar. It is the best we have in England of its period of execution, with the exception of that to Thomas Pounder, at St. Mary Key, Ipswich. It is also remarkable that in both instances the artist has committed errors in the heraldry, a proof of the work being executed abroad. The arms are those of the Salters' Company and of the Merchant Adventurers. In the former the chevron is turned upside down, and in the latter the lions are passant only, instead of being passant guardant. The latter arms are also in the Ipswich brass, and similarly in error.

The brass is exceedingly well engraved, the male figure having the appearance of a portrait. Above the figures is the composition known as a *pieta*, or deed chest, in the lap of the Virgin Mother. There are not many instances of this subject on monumental brasses, and only in those of late date. There are sufficient indications of the use of colour to make out the whole plan, but it requires to be judiciously searched for. The diaper background, representing tapestry, is red, and the same is employed at the back of the chair in which the Virgin is seated. The Merchants' mark is given at the foot of the figures, as in the brass of Thomas Pounder, at Ipswich, probably by the same designer. Notwithstanding the wilful defacement of the inscription, the whole is easily deciphered, and reads as follows: "Of your charite pray for the soules of Andrew Eryngar, cytezen and salter, of London, and Elynn hya wyff, on whos soules Theu have m'cy. Amen." On the scrolls, that to the male figure has, "O filij dei misere mei;" to the female, "O mater dei memento mei." Both these prayers are allusive to the group represented above the figures.

The brass is inlaid into a stone, with symbols of Evangelists incised at the angles of this sentence, "Ne reminiscaris domine delicta nostr' vel Parentum nestrorum neque vindictam animas de peccatis nostris." The following are placed one above the other below the figures, likewise de peccatis nostris, "Sana domine animam meam quin peccavi tibi. Ideo deprecor majestatem tu tu Deus delicias iniquitatem meam." The first is in the antiphon of the litanies of the Sarum Breviary; the latter in the third nocturn of the office for the dead, and the responsory in the second nocturn of the same.

The father of Eryngar was, doubtless, a Fleming; he was a brewer, and bequeathed to the church of Allhallows 6s. 8d. for tithes and oblations forgotten, and £1 6s. 8d. for making, painting, and setting up the rood in the same church; to a priest of good name and fame, to sing a trental of St. Gregory in the said church for a whole year next his decease, 40s., 41s., or 42s., as his executors might best agree with him, &c. He also left property at Antwerp to his wife, to revert in five years to his son Andrew. This connection of the family with Flanders is so far interesting, as it gives a reason for the monument being executed abroad. I may remark that the use of incised work on the stone as well as brass, exists only, as far as I am aware, in this example.

The next in interest is one to the memory of William Thynne, Master of the Henshold to Henry VIII.; date 1546. This was in a very mutilated condition, but has recently been restored, at the cost of the Marquis of Bath. When the fragments were removed from the slab, it was discovered that the reverses were engraved also, and, from the character of the execution, the older portions were not of earlier date than the beginning of the sixteenth or, at most, the end of the fifteenth century. The figures were composed of portions of an ecclesiastic holding a chalice, and of a female figure. The reverses of the inscription fillets were scarcely earlier than the monument, for which they merely supplied material. They were composed of fragments of inscriptions mostly belonging to one memorial, and preserving the Christian name and rank of deceased, one "Sir" John, &c. There cannot be the smallest doubt but that these were the results of the rifling of the tombs of the then recently dissolved monasteries—most likely those of London itself.

In many respects it is an interesting memorial of the period. The figures are good examples of costume, and the inscription, which is lengthy, is illustrative of the religious feeling which ensued upon the overthrow of the ancient faith. Much might be said upon inscriptions of this period of transition, and it is one well worthy of attention for its historic value.

I now pass on to a mere fragment, part of the decorations of a tomb, which has not preserved either name or the arms of the person intended to be commemorated. This, which represents the Resurrection, is not of common occurrence upon brasses, but is, nevertheless, one of the few subjects from Scripture which occur upon monuments. All those known

upon brasses are of late date, and the points worthy of remark are, that we do not observe that rigid adherence to the costume of the time which is the rule in Medieval work. The Roman soldiers are somewhat fancifully attired, as if the artist was aware that some difference should be made between the soldiers of Pilate and those of Kings Henry VII. and VIII.

There is another point, also, which must not be overlooked. In these late representations of this subject, the soldiers are not all asleep, but some are witnesses of the miracle.

Now, this treatment, which we at the present time think most natural and consistent, was not that which prevailed in earlier ages. I would only allude to the beautiful composition at Lincoln Cathedral, a cast of which can be seen at the Crystal Palace, as a type of many others, in which all the soldiers guarding the tomb are represented in profound slumber. Some writers—for instance, Méné, Didron—have thought much of this, and see in it the result of a deeper faith, which required no witnesses to establish their belief. However this may be, the fact belongs to the history of religious art, if not, indeed, to be regarded as one of the signs of the times.

The last memorial I shall select for notice is an almost effaced slab in the north aisle, once having the figure of a priest under a canopy incised upon it. It now has inlaid upon it a brass inscription to the memory of Thomas Vyrly, vicar, who died in 1451. Besides this there are two small detached wings, and a form which has hitherto been a puzzle to assign a name to, or to give an explanation of. One might suppose it was intended to be a chalice but for the stem, which is more like a bell handle. Some have supposed it may have been a face of metal to an incised slab, but there is an escalloped ornament which renders this view impossible. Something has been defaced or beaten out in the centre, which, if remaining, would possibly have led to a solution. It has occurred to me whether it might not be a form of the pax, and the part defaced a representation of the Virgin and Child. But I can only offer it as a suggestion, for all those with which we are familiar are of a different shape. At the same time, however, they are of a much later date.

In the above remarks I have avoided any elaborate description, or even a review of the entire number of memorials scribbled. That has already been accomplished by Mr. Maskell. I have rather pointed out those distinctions which render the monuments particularly worthy of regard. I would, in conclusion, observe that the preservation of ancient memorials cannot be better attained than by making a registry of them in the manner of Mr. Maskell's pamphlet. We are apt, very complacently, to ascribe the wholesale destruction and pillage, of which we have so much evidence, to the fury of the Puritans. I am convinced, by long observation, that by far the greatest mischief has been done in later times; by neglect, by cupidity of workmen, and the general disregard of those to whom the preservation of such memorials have been consigned.

Mr. GEORGE R. CORNEN then read some particulars respecting the wills, history, &c., of persons to whom monuments had been erected in this church, which we may give hereafter.

In the church of Allhallows, Barking, amongst other specimens of ironwork, are three beautiful pieces of wrought iron, in the shape of sword bearers, which are always used when the Lord Mayor pays a visit to the church, as is the custom at other city churches. We believe that the church of Allhallows, Staining, is at present undergoing reparation, and that the ironwork it contains is being taken down, with the intention, we have heard, of not being replaced in its original position. We hope such a decision, if it have been come to, will be reconsidered, and that such a piece of intended vandalism will not be perpetrated. In St. Olave's, Hart-street, there is a considerable quantity of ironwork, the tops of the pews having hat pegs in that metal.

From Allhallows, Barking, the company proceeded to St. Olave's, Hart-street, (which escaped the Great Fire of 1666) where they were welcomed by the rector, the Rev. A. Povah, who read a paper, in which he gave much curious information respecting the deeds and registers of the church, referred to the brasses and other monuments, giving biographical sketches of the more eminent persons to whom monuments were erected, and some account of the rectors of the parish from the fourteenth century downwards. Some pieces of ancient plate belonging to the church were shown to the company by Mr. Sass and one of the churchwardens.

The company next proceeded to pay a visit to the church of St. Dunstan's-in-the-East, designed by Mr. William Tite.

The Rev. THOMAS HUGO, F.S.A., gave an extempore account of the church, and read some very interesting extracts from the Churchwarden's books, which commence from the year 1494. The information which he furnished was specially selected by him as supplementary to that given in the history of the church and parish by the late rector, the Rev. T. H. Murray. Mr. Hugo traced the history of the church from the earliest times down to its destruction in the Great Fire, and from thence to its repeated erection first after that event by Sir Christopher Wren, and next in our own day by Messrs. Laing and Tite. After drawing attention to several of the monuments, the rev. gentleman selected a few of the most prominent of the rectors for a series of brief memoirs, and concluded his address with an affectionate and eloquent panegyric on his deceased friend, the late rector.

Mr. T. S. SMITH exhibited and gave explanations respecting a number of ancient books and documents belonging to the church and parish.

In the evening a number of the members and their friends dined at the Bakers' Hall, Mr. Alderman FINNIS in the chair; the entire proceedings of the day having afforded the utmost satisfaction to those present.

WORKS AT THE MANSION-HOUSE.—For some months past works have been in progress at the Mansion-house. They are now executed, at a cost of some £2,000 to the Corporation of London. The fabric, now about 120 years old, was originally designed and completed under the supervision of Dance, and that part of it between the vestibule and the entrance to the Egyptian-hall, now called the Saloon, was a court-yard open at the top to the sky, and that until a period within living memory. Many years ago, however, the Saloon was covered in with a roof with glazed compartments, but this was unsightly, and so low as to detract from the character of the building, with which it had nothing in harmony. The Court of Common Council having voted a sum of about £1,700, a coved ceiling, with panels or compartments of embossed glass, has been thrown over the saloon, supplanting the old flat ceiling, and some ten or 12 feet higher. The vestibule, saloon, and the principal staircase have also undergone a process of embellishment, which for years past had been much wanted. Of these portions of the building, throughout the whole interior, the ceiling and the panelling and niches of the walls have been painted in fawn, white, and grey colours, blended with gilding.

ALLOA.—The present Court House accommodation in Alloa having been considered very inadequate to the requirements of the locality, Sir George Grey, decided, on a report submitted to him by Mr. Mathieson, that additional Court-House accommodation should be provided. A site for the new edifice has been fixed on, and Messrs. Brown and Wardrop, Edinburgh, have been appointed architects of the new edifice.

DEMOLITION OF HUNGERFORD MARKET.

THE demolition of old Hungerford Market, for the formation of the West-end terminus of the Charing-cross Railway, progresses rapidly, and the Swan and Dolphin taverns, facing the river, together with the whole of the fish market, will soon disappear. The works of the Charing-cross Railway are now so far advanced that the directors expect to be able to open the line between the South-Western station in the Waterloo-road and the London-bridge station during the summer. A contemporary note that:—There has been a market, where there will shortly be a railway station, for nearly two hundred years, Hungerford-market having been built in the year 1680. Sir Edward Hungerford, of Farley Castle, Somersetshire, had a large mansion on this spot in the reign of Charles II.; but "the town" in those days was beginning to migrate still further westward. Pall-mall and the streets to the north of Piccadilly were rising, or had just risen, in the outer wilderness; and the Strand, which was the grand aristocratical suburb in the reign of James I., was fast becoming vulgar. Influenced probably by these circumstances, Sir Edward Hungerford pulled down his river-side house, and built several small ones on its site. At the same time appeared the market. It was generally anticipated that the speculation would prove a good one; and there were many reasons why it should do so. The proximity of the place both to the western and eastern suburbs—for ages the great nurseries of fruit and vegetables for metropolitan consumption—and the convenience of the river for conveying the produce from the market gardens of Fulham and Bermondsey, and delivering it at once at the very doors of the vendors, without the necessity of land carriage, pointed to Hungerford as the chief London market for what our forefathers used to call "green meats." But Strype, who in 1720 records these anticipations, at the same time informs us that the project was "balked at first," and had since turned "to little account," Covent-garden having got the start, and being "much resorted unto, and well served with all fruits and herbs, good in their kind." Still, Hungerford-market held on, and early in the reign of William IV. it was rebuilt, when fresh hopes were formed of the figure it would make in the London world. It was to be a dead meat and poultry market, fish market, and a vegetable market; and it was to eclipse its competitors by its manifold advantages. The first stone of the new buildings was laid on the 18th June, 1831, and the market was opened on the 2nd July, 1833. The architect was Mr. Charles Fowler. There seemed to be no reason why the speculation should not succeed; on the contrary, as we have already shown, there were many reasons why it should succeed, and yet it never has. Multitudes of people have passed through it daily for nearly 30 years, on their way to and from the boats, but they have never brought prosperity to the market, and Hungerford has made no progress towards supplanting Covent-garden, Leadenhall, and Billingsgate. In the summer of 1848 a portion of the centre was burnt down, and people said it would be better to sweep the whole away, but the gap was filled up, and the market has almost survived two more apprenticeships. It might fairly have been expected that the opening of the suspension bridge, in April, 1845, would be the forerunner of a better day for the market; but fate had decreed it otherwise. Some evil destiny seems to have hung over the whole locality; the bridge itself never having been popular.

MONUMENTAL BRASSES.

AT the concluding meeting of the Literary and Philosophical Society, Bath, the Rev. THOMAS BLISS read a paper on "Monumental Brasses," and exhibited a number of rubbings lent for the purpose by Mr. C. T. PHIPPS, architect, of Bath.

THE AUTHOR began by comparing brasses with sculptured stone effigies, which, he said, they were probably intended to represent on a flat surface; and being not only less costly, but more durable, they enabled a larger class to commemorate their dead, and thereby transmitted to posterity examples of the costumes of different ranks in society through four successive centuries. Of these memorials nearly 5,000 are still in existence, dating from A.D. 1277 to the close of the seventeenth century. The lecturer then proceeded to illustrate the costumes of the figures delineated on the brasses, commencing with a description of the eucharistic, processional, and academic vestments of ecclesiastics of various orders. He next pointed out successive changes in the armour represented on the military brasses, from the period of complete chain mail, showing the gradual introduction of plate armour, as weapons of offence became more formidable; tracing it, in its various stages, till it reached its perfection in Richard III.'s time; and indicating its gradual modifications, till, ultimately, in the seventeenth century, very few pieces remained of the original panoply,—observing that thus, from early times, that same race has been going on between the arts of defence and destruction, which has led, in our own day, to such revolutions in the construction of guns and ships. Having explained the costumes of civilians, by the numerous rubbings on the walls, Mr. Bliss went on to show the changes which fashion has wrought in ladies' attire—from the graceful dress of the fourteenth century, through the extravagant styles which prevailed in the fifteenth, to the plainer costume of the seventeenth. After referring to the manner in which children are commemorated on brass, he described the foliated and Latin crosses which are occasionally found till the era of the Reformation. The rev. gentleman next directed the attention of the audience to the accessories of the figures, tracing the successive periods of pointed architecture displayed on the canopies, reading many of the inscriptions, and pointing out the transition from the Lombardic to the black-letter, and thence to Roman capitals, and explaining the sacred, heraldic, and trade symbols found on brasses. The lecturer concluded by showing the difference between the manners and customs of the middle ages and those prevailing in our own day, which he illustrated by a description of the residence and daily life of a mediæval knight, and the contrast they present to the luxurious home and refined existence of his descendant in the nineteenth century.

At the conclusion of the paper, the Rev. H. M. SCARTH said that he had had the pleasure of hearing Mr. Haines describe his monumental brasses at Gloucester, during the meeting of the Archaeological Institute in 1860, when he also exhibited his rubbings in the Chapter-house, previous to the publication of his excellent treatise, and he was thankful to say that the subject had now received the attention which it deserved. In respect to the connection of sculpture with monumental brasses, that brasses had originated out of monumental effigies, and become more general in consequence of their being less expensive, Mr. Westmacott, at the same meeting, had very ably illustrated the progress of monumental sculpture from the earliest period of mediæval times to that of the Reformation, and had shown that the decline of the arts, which was generally attributed to the progress of the Reformation, was not due to that cause, but that the decadence could be traced throughout Europe prior to that event, and at a time when opposite principles were at their height. This decline in art was common to sculptures and brasses, which improved or declined together. It was one thing to pore over the pages of a dry record, and another to find a page of history in the dress of every monumental effigy. The dresses of mediæval times gave life to mediæval history. We conjured up the very actors in the scenes of which we read, when we understood the history of their costume; and to the student of archaeology an ancient church, with its monuments, affords a rich treat, and implants a series of historical events in his mind. He desired to give all young persons a taste for these pursuits, because it helped them greatly in the study of history, divesting it of much that was distasteful.

THE ENGLISH SCHOOL OF PAINTING, FROM THE YEAR 1762 TO THE PRESENT TIME.*

IN whatever way, and to whatever extent, the commercial interests of industry may be affected by the International Exhibition, just opened—and commercial interests in the hardest sense of trade, I must observe, appear to be too much the ruling purpose in the carrying out of that gigantic enterprise—however the struggle may end between the decorative furniture of Paris and of London, between the silks of Lyons and of Spitalfields, between the hardware of Sheffield and the imitative products of the Zollverein; however the contest between the pianofortes of Broadwood and Erard may terminate or whatever the verdict of thirsty John Bull upon the cheap thin wines of France, of the Rhenish provinces, or of Hungary, as compared with Alsace's pale ale, or Barclay and Perkins' stout; whatever the revision of æsthetic feeling created more or less in all men's minds by Captain Fowke's monster shed, with its two dish-cover domes, and the cruel ridicule it may bring down upon us from our foreign visitors; there is one feature in the Exhibition which, appealing to the higher intellectual faculties, and the poetic feeling of the community, cannot but be viewed with intense interest by all who look to the cultivation of taste as an essential element of advanced civilization. The Picture-gallery, in which are assembled the choicest works of painting from all parts of Europe, and in which artists and amateurs of all nations will meet to observe, and compare, and exchange experiences and opinions, cannot fail to be of immense importance in promoting the cultivation of art upon broad principles, and in that genuine spirit of eclecticism which springs not from theoretic teaching, but from the conviction of actual eye-proof.

That art, albeit, in its first instincts often a matter of inspiration, is not altogether of spontaneous growth, not intended for selfish isolation in its exercise; that, on the contrary, it is a divine calling, calculated and designed more than any other as a medium for bringing into friendly and improving association, noble suggestions and creative genius of the whole brotherhood engaged in the one common field; and that the most excellent works of the principal schools, and of the principal masters of those schools, have been thus produced after the greatest amount of interchanged experience with other schools and masters, is a fact fully established by the whole progress of the renaissance of art in Italy—the mother of modern art—as well as in the Netherlands, in France, in Spain, in Germany, in England itself, and wherever else the fame and influence of Italian art was acknowledged, and so long as the tendency towards that school predominated. After Italian art experienced its rapid decline, and its supremacy began to give way in proportion, the great original schools of Flanders and Holland, with Rubens and Rembrandt at their head, began to exercise a direct influence upon the arts of other nations; and thus during a period of upwards of two centuries, the schools of Italy and of the Netherlands were recognised as the two universities of art throughout Europe.

These considerations it is most important to bear in mind when reviewing the history of art, as tending to supply the pedigree and account for the traditions of the art of various nations. Their application would be inexhaustible in suggestions of interest, but it would occupy too much time to go into such a study through all its ramifications. It may suffice, therefore, to point to one or two leading facts,—how art in France took Italian art, already at its zenith, and in the very point of its decline, for its model, and wasted its resources in ambitious efforts on tame religious or cold Classic subjects; and after passing through the phase of heroic exaggeration in David and Delacroix, began to take refuge in a laboured imitation of the miniature domestic subjects of the Dutch school;—how art in England took its first suggestions from the great living masters of the Flemish and Dutch schools, and became less ambitious, but more genuine and truthful, than the sister art of France;—how, in after years, towards the end of the last century, the Netherlands being closed against English travellers, Italian travel, and the importation of Italian paintings, changed its direction, and produced a historic school, in which the manner and suggestions of Italian and Netherlandish art were strangely blended,—a hybrid product, which, being little consonant with national feeling and national requirements, was but of short and unprofitable duration;—and how, lastly, in landscape and domestic story-telling subjects, our art finds useful, honourable, and remunerative employment, ministering to the tastes and fancies of all conditions of men. And to conclude with one other instance, we see how Germany, the last to throw off her barbaric, untutored, indigenous art, at the beginning of the present century, flew to Rome, and endeavoured to transplant to her cold northern clime, and amidst her unimpulsive speculative philosophy, the types of the devotional art of Italy in her days of most absorbing religious fervency; and how this ill-advised attempt to resuscitate the art of an age and feeling which had passed away had repudiated by the artists of Northern Germany, who established the school of Düsseldorf, with nature—the nature of external creation as well as of domestic life—for its field.

We have stated that amongst the early schools of art the interchange of experiences and suggestions was very apparent, and attended by mutually beneficial results: we have shown that the old schools of Italy and the Netherlands, thus brought to perfection, became the parent sources from which the principles of the more recent European schools were mostly derived. But here the story of the traditions of art, and the mutual relationship of the schools of art, unfortunately comes to an end. When the primal vigour of the Italian and Netherlandish schools had given way—when their fructifying streams were stopped— and, above all, when the grand religious and historic themes of the former were no longer the staple subjects of the painter's art—the Art-family, losing its common head, and losing every day more and more the ties between its members, became scattered over the face of the earth, every one acting with distinct and independent purpose, without interchange of sympathy, counsel, or experiences. The state of things during this time—namely, dating from the close of the last century—is forcibly and practically put by Dr. Waagen. Speaking of this period (which he puts as the date of the commencement of "original painting in England"), he says—"the original schools of the whole of the modern times of Italy, the Netherlands, and Germany, and their branches in France and Spain, had long lost their peculiar character, and in their stead there had succeeded, all over Europe, a manufacture of cold, monotonous, spiritless pictures, founded on the general rules and precepts of art, which were communicated in the various celebrated academies. The demands of religion, the broad foundation on which, in other schools, historical painting had gradually grown up from its first infancy to vigorous maturity, no longer existed. This highest branch of art was now only occasionally in request for the decoration of palaces and other public buildings; all other demands on living artists were confined to portraits. Even the tradition of the technical part of painting, which had been conscientiously handed down in the old schools of living art as the most indispensable fundamental condition even of the highest performances, had been gradually forgotten, as of inferior importance, amid those dead rules of pure taste and ideal beauty of form." This, in other words, clearly indicates a state of universal anarchy, in the midst of which the practitioner of art appropriated what he fancied, or what first came to hand, of the resources and traditions of art, and applied it after his own fashion, without regard to what had been done before him or what was being done by his neighbours—thus, as it were, beginning the art anew, each in his particular case. How true what Dr. Waagen says as to the loss of the very technic conditions of painting is, will be acknowledged by all who recollect Reynolds's perpetual experimentalising in vehicles, the uncertainty as to Titian's and other great colourists' mode of painting—uncertainty vainly attempted to be resolved by the dissection of some of their pictures, and, alas, by too many tawdry, yet heavy and opaque, canvases which load the walls of contemporary exhibitions.

This is a long exordium *à propos* of the Picture-gallery of the International Exhibition and I may, perhaps, be asked what purpose I had in making it. Simply this; to show that, in the severance of art interests and art experiences which has occurred since the decadence of the great early schools has been our weakness; and that in the association of artist with artist, of school with school, in short, in a union of resource, will be the strength of future art. It is on this account that I hail this International gathering of art, and hope it will be but the commencement of a co-operation and universality of purpose and action amongst artists as boundless as the spirit of art itself.

But the immediate purpose before us this evening is with painting and painters in England from 1760 to the present time; in fact, our art pretensions as a nation, having particular reference to the display made in the International Exhibition. Let us hope that the effect of that display will be to qualify the sentence passed against us a hundred

* Paper read by Mr. HENRY OTTLEY before the Society for the Encouragement of the Fine Arts, Conduit-street, Regent-street, 1st May.

years ago by the Abbé du Bos, Montesquieu, and Winckelmann, and which was greedily accepted throughout Europe, and hitherto has remained on record, without question or appeal—namely, that from "a certain character of heaviness and want of fancy," which those amiable persons deduce from "physical causes," the English people are not capable of cultivating the fine arts with success. Alas! how little hitherto have nations known of one another, except through the agency of war and diplomatic artifice! How little of one another's achievements in the arts of peace! Down to the time of the great International Exhibition at Paris, in 1855, there were but three names of English artists which might be said to enjoy common renown amongst our French neighbours—Reynolds, Landseer, and Martin! and Dr. Waagen, in his work on "Art and Artists in England," originally published in 1835, already referred to, acknowledges to having made his first acquaintance with the artists of the English school through the medium of the few pictures in the Angerstein and Beaumont collections, which formed the nucleus of our National Gallery. He tells us:—"I come at length to the English school. Of its most eminent names the gallery possesses some of the most celebrated works. As I have hitherto known hardly anything of these masters except from engravings, the sight of their pictures was particularly interesting to me. I was thereby induced to form an idea of the peculiarities of the English school of painting, and its relation to other schools, of which I give you some particulars;" and then, upon the evidence of some dozen or so specimens of Hogarth, Reynolds, West, Wilson, Gainsborough, and Wilkie, he pronounces his estimate of the "peculiarities" and pretensions of our school of painting, overlooking Northcote, Opie, Fuseli, Haydon, Hilton, Mortimer, Eddy, Crome, Constable, Nasmyth, Lawrence, and a host of others, who have each contributed their pabulum to the general fund, but whom, perhaps, he had never heard of as "masters" of the English school. Of Turner, in another part of his work, he speaks as "this spirited painter, who is so great a favourite with the English;" and then goes on to make small account of his celebrated sea-piece in the Bridgewater Gallery, painted in emulation of Van der Velde, as "a successful piece of scene painting," remarking that "the great crowd of amateurs, who ask nothing more of art, will always prefer Turner's picture;" and, in another place, he again makes passing mention of Mr. Ruskin's idol in these terms:—"I made a point of looking for the landscapes of the favourite painter Turner, who is known throughout Europe by his numerous, often very clever, compositions for annuals and other books, where they appear in beautiful steel engravings," and then gives him another set down, declaring that on looking at the Ehrenbreitstein, and the Burning of the Houses of Parliament, he could scarcely trust his eyes, discovering in them "such a looseness of treatment, such a total want of truth, as I have never before met with." Who shall decide, when doctors—such doctors as Waagen and Ruskin—disagree? Let us accept, at any rate, as an advantageous and happy event, any arrangement which shall bring general opinion to bear upon questions of this kind, and to afford opportunities of comparison between the most esteemed performances of the several contemporary schools.

It has been a fancy with some persons to place Hogarth as the founder of the English school of painting. But this was a mistake: Hogarth presented one of those rare instances of superior genius which attained the highest pinnacle of excellence and renown without aid or instruction from any one; and as he was entirely self-created and self-taught, so he had no pupils and left no followers,—saving, perhaps, slightly and indirectly, in the caricatures of Gilray and Bunberry. The true founder of the English school was undoubtedly Reynolds, with word homage of Michel Angelo and practical imitation of Rembrandt, in whose mystic chiaroscuro he sought to conceal his want of drawing. This style was directly followed by Northcote, Opie and others, but with less transparency in their gloom, and no improvement upon his unhappy mixture of pigments and vehicles, which often resulted in fearful chasms and accumulating *débris*, as of the lava of Vesuvius in their works, as it did in so many of his also. Reynolds was very secret and mysterious in the experiments he tried with these vehicles—perhaps, fortunately so—though his conduct here is strongly illustrative of the illiberal spirit which characterised the great founder of our school. And, in further illustration of this tendency, I may mention the anecdote of the way in which he received an application from a young student, who was about to compete for the Academy prize medal, and brought several designs he had made for the purpose, in the hope of obtaining the President's opinion as to which was the best in point of sentiment and most descriptive of the story represented. Reynolds's reply was—"You may choose whichever you please, it will turn out precisely the same: you are to recollect that your picture is to be judged of by painters only. It will be the manual execution of the work, and that alone, which will engross the attention of artists, and the degree of merit displayed in that part of the art is what will determine them in their election of the candidate for the prize." Such the idea of the province of the teacher in art—to instruct and to encourage, entertained by the first President of the Royal Academy!

It is an unavoidable necessity that, in treating of painting and painters in England during the past century, we must make reference, more or less in extent, to the Royal Academy. A strange misgiving—an irresistible repression of noble aspirations, comes over us as we name that institution, accompanied by cold visions of red tape and scarlet-collared royal liveries, greasy fumes of soup, and ominous clink of the gold chain of Bumbledom. It is not my intention, however, to go into the origin and history of that aristocratic monopoly—how it owed its establishment to a secret cabal amongst certain disaffected members of an independent society of artists, and how, rising upon their ruin, it has paralysed all independent action in artists, as a body, since. Nor will we inquire into the question of its financial position: the large income it derives from an exhibition of pictures, nine-tenths of which are painted by men who, not belonging to the Academy, have no participation in the proceeds, and the manner in which that income is appropriated; nor, lastly, will we examine into the tenure by the Academy of premises belonging to the public. All these are questions which have been often argued, and will be argued again and again, but which we have not time to enter upon at present. I propose, however, with your permission, to say a few words about the Academy—first, as the fountain of honours in art; and, secondly, as an educational establishment.

And, first, of the Academy and its dispensation of diplomas of honour. Putting aside all consideration of the self-selective principle, and the arbitrary mode in which the Academy is constituted, we cannot but be struck with the inelastic character of the institution itself. Rightly to understand this, we must consider the number of artists and the standard of art in 1768, as compared with what they have attained since, and the extent to which the arts are cultivated amongst the community. A hundred years ago there was no patronage for the limner's art, except when employed in portrait painting, or sign painting, or carriage painting. There being no public exhibitions, the few insane enthusiasts who tried their fortunes in history or landscape were beholden to some neighbouring shopkeeper for the exposure of their works in his window, and when a sale was effected were glad to receive whatever the tradesman thought proper to give out of the proceeds; the latter, by the way, invariably concealing the name and residence of the artist from the purchaser, for fear of establishing direct dealings between artist and patron, and thereby sacrificing his profits as middle man. Then, to crown all, we had a German king impervious to all generous or ennobling sentiment, who boasted that he "hated poetry and painting," and a court as rude and barbarous in feeling as their chief; and can we wonder that artists were few, and held of little account, in those days?

When, therefore, under those circumstances, George III. fixed the number of Academicians at forty "men of fair moral characters and high reputation in their several professions," the allowance may be considered a pretty liberal one, and it was probably intended in that spirit, and as calculated to comprise all artists of real proficiency then existing, "not being members of any other society of artists established in London." Indeed, at first starting, the number was found more than enough—more than could be filled consistently with the purposes with which the Academy was established, as appears evident from the fact that the original members nominated in "the instrument" of foundation only amounted to thirty-six in number, of whom two were women—Angelica Kauffman and Mrs. Moser, and looking over this list, how many do we find who did nothing which either illustrated their own names at the time, or which has descended to posterity? The walls of the Picture-gallery in the International Exhibition will afford but too convincing proof of the weakness of the Academy in its earlier days; whilst in its later days it cannot but give evidence of experiencing a pretty strong competition from "outside" men. Of the thirty-five artists of "high reputation in their several professions" constituting the Academy in 1768, when we have made exception of Reynolds, Gainsborough, Wilson, West, Zuccharelli, and Paul Sandley in painting, and Chambers in architecture, what name do we find which

is even remembered by any tradition of honourable achievement in art? Let us pass a few of them in review. There was Michael Moser, a native of Switzerland, gold chaser by profession, who afterwards took to painting in enamel, and, on account of his supposed profound knowledge of the human figure, was appointed keeper of the Academy. There was Mary Moser, the daughter of the above, who was a painter of flowers. Then we find Francis Milson Newton, a portrait painter, appointed secretary (and who, in that capacity, wrote a stiff letter to James Barry, notifying his expulsion from the academy for *disrespect* against his brother members). Next comes Edward Penny, who had been a pupil of Hudson, and chiefly employed himself in painting small portraits in oil, but occasionally indulged in historical and fancy subjects, as "The Death of Wolfe," "The Marquis of Granby relieving a sick Soldier," "Virtue Rewarded," and "Profligacy Punished," which, though engraved, I do not recollect having had the pleasure of meeting with. This eminent man was appointed professor of painting. Next appears Samuel Wale, who designed book-illustrations, long since forgotten, and sign-boards, one of which, a large whole-length of Shakspeare, for many years decorated the doorway of a public-house at the corner of Little Russell-street, Covent-garden; he was appointed Professor of Perspective. Francis Hayman, another book-illustrator, is spoken of somewhere as "the most respectable historical painter of his day," in which capacity, however, we are told that he was "principally known by the pictures he painted for Vauxhall." These pictures, four in number, were illustrative of scenes in Shakspeare, and were so highly prized by the proprietor of that once fashionable resort, that he caused copies to be substituted for the originals, which he removed elsewhere. One might be curious to know where they now "blush unseen." Cipriani was a painter of pretty sentimental platitudes, well fitted to hang as pendants to those of his female compeer Angelica Kauffman. Domenico Serres was a painter of marine landscapes and sea-fights, which, we are told, "as artistic works, are of little value." Then we have Jeremiah Meyer, a miniature painter; Peter Toms, drapery painter to Reynolds; Francis Cotes, portrait painter; John Baker, flower painter; Nathaniel Dance, pupil of Hayman, who painted history, portrait, and landscape with equal success and distinction, and fortunately retired from the practice of the arts on coming into a baronetcy and a fortune; William Tyler, Agostino Carlini, Charles Catton, John Gwynn, John Richards, and Richard Yeo, about neither of whom is anything noteworthy known; and, to conclude, Joseph Wilton, the sculptor, whose genius was honourably acknowledged by the illustrious founder of the Academy, by his appointment as State Coach Carver to his Majesty.

Let no one disturb the honours lavished upon these illustrious names! But, at the same time, may it not be permitted us to suggest whether, if their merits were considered the standard of eligibility to the Royal Academy, the number of members might not now be somewhat extended? and, apart from the abstract justice and consistency of so doing, might not a liberal infusion of new blood be advantageous to the Academy itself, at a time when we find so many of its members almost past work; whilst one or two others, doubtless with the soundest possible commercial principles in view, prefer exhibiting elsewhere than at the Academy, for the pecuniary gain of themselves and of the traffickers in art with whom they have allied themselves? This sort of proceeding, by the way, appears to be clearly at variance with the spirit and intention of the original "instrument," which provides that "all academicians, till they have attained the age of sixty, shall be obliged to exhibit at least one performance, under a penalty of five pounds, to be paid into the treasury," and also with one of the bye-laws, which excludes from claim upon the funds of the Academy those who, during two consecutive years, shall omit to exhibit; and still further with another law, which excludes from competition for the honours of the Academy those who exhibit with other exhibiting societies. But it is beneath the dignity of art to pursue this question, in the mere sense of one of pounds, shillings, and pence, further.

A more important consideration is as to what the Royal Academy has done in the way of instruction in art, and whether the system upon which its teaching is given is the best that could be adopted for the purpose. I will not here go into the general question as to the efficacy of academic teaching, which has been so much discussed, and upon which Fuseli, Waagen, and other respectable authorities have pronounced in the negative; I will simply beg to direct attention to the mode and amount of tuition afforded by our Academy and to its fruits—what valuable principles it has established, what great artists it has produced.

With respect to the machinery of education employed. It is an old maxim, one, indeed, established upon scriptural authority, that the labourer is worthy of his hire, and experience tells us that the value of service rendered is very generally in proportion to the amount of remuneration accorded. We all know the story of the lawyer, who, having been inveigled into giving an after-dinner opinion to a friend, which opinion led to fatal and costly disappointment in the courts of law, when remonstrated with on the subject by the latter, inquired, "What did you pay me for my opinion?" and being answered "Nothing," replied, "Then, that is about what it was worth!" Now, it is not exactly the case that all the duty of instruction at the Royal Academy is done gratuitously; the keeper receives £100 a year, and the several professors £60 for delivering six lectures in each session; and the nine visitors, elected annually from amongst the academicians to attend the schools by rotation, each a month, "to set the figure, to examine the performances of the students, to advise and instruct them, to endeavour to form their taste, &c." receive "10s. 6d. for each time of attending, which shall be at least two hours." Now, no one can say that these emoluments are to be characterised as munificent. On the contrary, few will deny that, considering the value of money, and of time, which is money at the present day, they are simply ridiculous, and that the utmost amount of "advice and instruction," which the students have a right to expect in return, must be of that negative character which Reynolds gave the innocent youth who ventured to consult him upon the relative merits of different modes of treatment he had prepared for a prize subject—"whichever you please, my little dear!" Instruction in the classics, in law, in divinity, in music, in other accomplishments, is liberally paid for—why not that in the arts of design? Dr. Waagen, to note his authority again as a practical man, and fully experienced in the system of art-education adopted abroad, soon saw through our weak point in this respect, and expressed it in plain set terms which it is impossible to resist. After suggesting the necessity of Government interference in the matter of education in certain cases, he says:—"Thus, for instance, the Royal Academy of Arts is, in fact, only a private association of artists, who have nothing from the State but apartments, the titles of president, professor, &c., and permission to make an annual exhibition. Under such circumstances, especially in a country like England where everybody's time is so valuable, no great expenditure of time or labour can be expected from the members. The necessary consequence is that the Academy, as the highest institution for giving instruction in architecture, sculpture, and painting, must very inadequately accomplish that important object. In the most favourable cases, the five professors who have to give instruction in anatomy, perspective, architecture, sculpture, and painting, deliver six lectures in the course of a whole year. But it has happened that only three or four have been delivered, and even, in the case of the death of a professor, a whole year has passed without a lecture." He might have added that in the case of perspective, of which Turner was professor, years passed without any lecture at all; and he goes on to state that, in respect to architecture it happened that from 1824 to 1830, that is, for six entire years no lectures were delivered," which circumstance actually led to the foundation of the Society of British Architects in 1835. Of the general results of such miscellaneous and eleemosynary instruction, Dr. Waagen goes on to observe:—"But if such an institution is really to produce any effectual good, a thorough course of instruction, returning in regular and uninterrupted successions, is indispensable. This want, which has not hitherto been compensated in England, either by restoring the ancient relations between masters and scholars, or by the opening of ateliers, partly accounts for the dilettante-like irregular character of so many productions of all the three arts."

So much for the technical element; now for the intellectual,—supposing for the moment that in our modern philosophy intellectually be considered desirable in connection with the arts of design—which, by the way, judging from actual experience, one might be very much inclined to doubt,—but however this may be, it is a fact that in the whole constitution of the Academy there is no provision made to improve, advise, or assist the student in matters ordinarily understood as entering into a liberal education; and considering that art gifts have very generally been found to fall to the lot of youths who, from their position, or the circumstances of their families, have had but moderate advantages of education, the omission cannot but be regretted as of fatal import. Da Vinci, Michel Angelo, Raffaele, the Carracci, Salvator Rosa, and numberless others of the great masters o

old, were men nobly gifted in every refining art and taste, and highly educated in every branch of intellectual culture. Hence the supremacy of their works, and the persuasive force of their teaching. In the English Academy of Arts there is no professor of poetry or music; and the professors of ancient and modern history are honorary sinecures. Hence the paucity and poverty of idea under which our artists too often labour, and the small and unworthy manner in which they too generally treat a great subject when they attempt it.

It is a singular fact, and one very suggestive as to the value of our Academic teaching, as far as it goes, that it is precisely in landscape, in which the "Forty" do not condescend to give any regular instruction, that the art of England has made the most distinguished figure; constituting, indeed, a school which is without a rival in the world.

It would be impossible, in a discourse like the present, to attempt to pass in review, individually, even the most prominent artists of our school. The observations I have ventured to make have been of a general tendency, applying to matters of principle, and the very few examples of artists which I shall now refer to will be selected chiefly on account of their illustrating the working of our schools, or some other principle bearing upon the promotion and encouragement of art in this country.

Suppose, in answer to the question what has Academy teaching done for art, what great names has it turned out? we take the names of Turner and Etty, the two great masters of colour—the one in landscape, the other as applied to the figure. With respect to Turner, Mr. Ruskin assures us, that whatever excellence he attained to was not acquired from the teaching of the Academy, but rather in spite of it. One thing is certain, that there was nothing in the Academy, or the Academy teaching, which inspired him with respect for high principles in art; nothing which guided or restrained his hand, or he would not have gone on experimentalising, often as in the dark, darkly, and falling into extravagance and error, as he continually did to the end of his life. If in his youth he had found himself under a great master, whom he could have looked up to and deferred to, he would have become the greatest landscapist that ever lived; as it was, he found himself possessed of enormous natural gifts, which were not turned to the best account.

And what did Etty gain from his unremitting study at the Academy, from the first day of his admission as a student till within a few months of his death? Simply to paint from the model; his pictures being little else than Academy studies. Etty, like Turner, was egotistical, and had little veneration for any art but his own; hence he never went beyond his own narrow sphere, and the teaching at the Academy supplied few incentives to him to do so. When he went to Italy in 1816 he seems to have been inspired with little or no feeling for the great masters in painting, or for the localities hallowed to posterity by their names. Florence, to him, was "a gloomy city;" he "began to draw in the gallery" there, but "could not get on;" and the same at Milan, Bologna, and other places. A few years later he renews his travels and goes to Rome, "where," his biographer tells us, "the Raffaels of the Vatican, and other world-wonders were, under the skilful guidance of a friend, swiftly inspected." "Twice as much," he writes himself, "as I should have done alone; seen at the cost of some exhaustion and much running about." With a natural tendency solely to that which is sensuous in art, which his education at the Academy had in no respect served to qualify by the mixture of higher aims, he declares Venice to be the "best school for the painter;" and though he could see little to arrest him in the sublime creations of Michel Angelo and Raffaele, he is fervent in his admiration of Giulio Romano's mythological subjects. One passage, in a letter to Sir Thomas Lawrence, places the art-tendencies of the man strikingly before us, and fully justifies what I have said of him. "That Chamber of Psyche," he exclaims, "how novel, classical; every way extraordinary! It is a treat to find a series of pictures that handles classical subjects in so learned and antique a style, after being deluged with saints, martyrs, and Virgin Marys by thousands. The imagination revels in his poetic landscapes. His giants intimidate; his females, though voluptuous in the extreme, have an air of greatness truly Roman."

Stothard, who started in his artistic career self-taught, and cramped his style by drawing patterns for brocading silks and book illustrations, obtained nothing from the teaching of the Academy to induce him to adopt a broader and nobler style, and the consequence was that, always charming for his elegance of sentiment and gracefulness of pencil, he remained, in subject and in treatment, small and weak—"cribbed, cabined, and confined"—to the last.

Wilkie owed nothing to the teaching of the Royal Academy, for he came to London at the age of twenty with his style ready-made and his fame secure, exhibiting his "Village Politicians" and the "Blind Fiddler" successively in the two following years. The Hogarth of comedy and domestic life, it had been well if he had been permitted to indulge his pencil in congenial subjects to the end of his career, but tyrant patronage stepped in to direct his splendid genius to labour utterly unworthy of him. Appointed principal painter in ordinary by George IV., and afterwards by William IV., portraiture became his bitter doom, and he died at sea on his return from an expedition to Constantinople, to paint the interesting features of the Sultan.

To come to a close, Leslie tells us, in his autobiography, that in the year 1822 Constable wrote as follows:—"The art will go out. There will be no genuine painting in England in thirty years;" adding—that is, Leslie—"and it is remarkable that within a few months of the date thus specified, Turner should have died, almost literally fulfilling, as some of his admirers may think, Constable's prophecy." This is a view of the matter taken from a strictly academic point of sight. Leslie's powers, never of the most robust kind, were at the time he wrote thus, visibly and hopelessly on the wane; and the ranks of the Academy presented many an illustrious veteran to whom the same remark would apply. But the autobiographer appears to have overlooked the fact that since Constable wrote—aye, whilst he himself was annotating what he had written—a new and enterprising band of artists was pressing forward to occupy and improve the ground which the Academy had so long unprofitably occupied and culpably neglected. Of the performances of this body, which, for some unaccountable reason, has been nicknamed "Pre-Raffaellite," it is not my intention to discuss the merit at present; time would not allow it. I may observe, however, that they have certainly done much to counteract the old tendency to looseness and carelessness of execution, which, from the time of Reynolds downwards, has been too fatally prominent in our school of painting, and that their exertions, qualified by moderation and directed by sound judgment, cannot fail to exercise a considerable improving influence upon the performances of British art. All that will then be wanted will be to apply the art to nobler and more elevated themes than at present too generally occupy it—a result which must mainly depend upon the creation of an improved taste amongst the public, who regulate the market which the artist has to supply, and the friendly interchange of sympathies between artists of all schools and nations.

INVENTORS' INSTITUTE.—A preliminary meeting of inventors and others interested in patent property has been held at 26, Great George-street, Westminster, and an association, to be called the "Inventors' Institute," was formed for the following objects:—To unite and organise the influence of inventors and patentees; to facilitate the progress of science in connection with inventions; to obtain a simple and efficient administration of the Patent Law, and generally to protect the rights and promote the interests of inventors. It was determined that the subscription of an annual member should be one guinea per annum, and that the payment for becoming a life member should be ten guineas. A provisional committee was appointed, of which Mr. Robert Richardson, C.E., was elected the Chairman, and arrangements were made for shortly convening a public meeting to further the interests of the Institute.

SANITARY.—A deputation from the Metropolitan Association of Medical Officers of Health has had an interview with Secretary Sir George Grey, at the Home-office. The deputation brought under the notice of Sir George Grey certain defects in the sanitary provisions of the Metropolitan Local Management Amendment Act, relating especially to the space at the rear of new buildings and the removal of manure.

THE VARIOUS SYSTEMS OF COLOURED DECORATION OF THE MIDDLE AGES.*

I MUST confess the subject under consideration to have been so often treated, and by such able hands, that I feel almost ashamed to take it up; however, so little has actually been done, and that little is so unsatisfactory, that I conceive the cause of polychromy will be all the better for being ventilated as often as possible. I therefore propose to confine myself to the best period of art, viz., the thirteenth century; to relate what little I have been enabled to observe by careful investigation; and, lastly, to give a few reasons why our present mural decoration is in so unsatisfactory a state.

If any one reads the very admirable series of extracts from the liberato and close rolls of the reign of Henry III., published in "Parker's Domestic Architecture," he will see that nearly every room had some kind or other of painting on its walls. It is very true that this painting ranged from red lines imitating stone joints upon a white ground up to the more gorgeous work blazoning with purple, gold, and azure, in the celebrated Painted Chamber; but, homely as much of it must have been, it was infinitely more durable and more artistic than the wretched paperhangings, in company with which we are condemned to pass our lives. Henry III., who, indeed, was the only one of all our rulers, with, perhaps, the exception of Charles I., who ever had the least appreciation of the fine arts—appears to have taken the most lively interest in the decoration of his palaces. We find him continually choosing the subjects of the paintings both on the walls and on the windows, and stating how some were to be executed in fine and exquisite colours, while others were to be done decently without gold and azure. The king, indeed, does not appear to have been exempt from that irritability said to be the fate of all lovers of the fine arts, for on one occasion a certain sheriff is ordered to get some work done as he values his life and chattels, and at another no less a person than Edward Fitz Otho is commanded to cause a certain passage to be made as he would avoid the ire and indignation of the king.

Unfortunately, almost all of the palaces mentioned in these records have long ceased to exist.—Kennington, Clarendon, Epsom, Gillingham, and many others, are all gone, and the great hall at Winchester is almost the only remnant of the royal magnificence of the rival of St. Louis. But the generation which is now passing away has had a greater privilege than we have, for they have seen the great historiated chamber at Westminster with their mortal eyes, while we are fain content ourselves with the plates in the *Vetusta Monumenta*, which, however accurate they may be, can convey but a shadow of the wonderful richness of the original.

From all these accounts it would appear that every building, as soon as it was finished and sufficiently dry, had some sort of decoration applied to it, exactly as we now put on a paper; and could we at the present day get rid of these latter abominations, it is very probable that our whole art would take a corresponding advance.

Now, let us suppose ourselves in the thirteenth century, and, in the first place, let our building be a very common one—say an ordinary village church; well, the walls have been allowed to dry, and the whitewasher has been sent for, who has covered the whole surface with a coating of *gesso*, most probably whitening mixed with a little size. [In our churches the face of the stone dressings are on a level with the rubble wall in the interior; these latter are dubbed out with coarse plaster to bring them to a face.] Now the whitewashing *gesso* is about one-eighth of an inch thick, but when he comes to the stonework he edges it off to nothing, contenting himself with covering the stone with the slightest possible wash, so as to make the colour of the whole uniform; that is, he did not leave the stone uncoloured, as we do in these days, as if it were something to be proud of, because it costs more than rubble; on the contrary, he viewed it simply as part of the construction and went over it accordingly. [As a general rule, all stone used in the interior of a domestic building should be painted, as it otherwise is apt to catch the dust and get dirty.] The next thing was to make a bargain with the painter, who was, most probably, a peripatetic artist travelling from place to place with his pattern-book, containing drawings of the histories of the more favourite saints. The subjects having been selected, this gentleman sets to work, by drawing in the outlines with red ochre mixed with a little black. His palette of colours was of the most restricted description, containing simply yellow ochre, red ochre, black, and white; sometimes, indeed, there are traces of what appears to be red lead, but it is almost impossible to be quite sure. With these colours he filled in his outlines, carefully breaking up and shading each tint; the ground was generally left white, but occasionally it was yellow, while a couple of lines separated one row of paintings from another. Several subjects, when occurring on the same row, were seldom separated, but followed one another as in a frieze. Now it is by no means a very easy thing to paint a series of historical subjects in four colours, viz.—red, yellow, black, and white; and very considerable practice must have been required before the artist learned to balance them properly. I tried, the other day, to do a subject in this manner, and the result was that I tore up my work in great dissatisfaction. However, for the benefit of others, I will venture to repeat here a few notes I made of some very perfect mural paintings of this kind lately discovered at Charlge Church, near Oxford, and which have been published in the "Archæologia."

Flesh.—The ground is red ochre, mixed with white, until it became very light.—Indeed, in some cases, as in the figure of St. Helena, the face would appear to have been left white designedly. A little red was used for the cheeks and mouth; the outlines of the features in red lines, as usual; pupils of eyes light black or slate colour. *Hair.*—Yellow ochre, worked over with red lines. *Black Drapery.*—The lamp-black was mixed with white until it became slate colour, and the lines of the drapery put in with white. In some cases, it would appear that the slate-coloured drapery was shaded with black mixed with red. Black is also used in two distinct ways, viz., first, as black, with very little white; and, secondly, as slate colour—i.e., with a great deal of white; but the latter was by far the more usual, as the dark black would have been too prominent, and have made patches in the composition. *White Drapery.*—The white drapery has the usual red lines, and is sometimes shaded with very light red. Occasionally it was left quite plain, with little or no shading; but then its under side is painted of a very light red colour, giving the same effect as a general shading, more especially when the drapery is rather complex. *Yellow Drapery.*—Yellow ochre, with red lines, and apparently shaded with white. *Red Drapery.*—Some draperies have light red ground, red lines, and white high lights. It is probable that the pure red drapery had white high lights, and either white or black lines. Occasionally it would appear to have been shaded with yellow.

The mouldings and architectural accessories, which are generally very plain in the inside of a common village church, received a decoration of stars or some other very simple ornament. Sometimes, indeed, a still more inexpensive decoration was adopted, viz., the walls were covered all over with a pattern resembling the joints of brick or stone work; an ornamental border would run along the top as a sort of cornice, while the bottom would often be painted with a rude imitation of a curtain. In this case the arches would have red lines to represent the joints, totally irrespective of the real ones beneath the *gesso*, and if these imitation voussours were large, and there were no mouldings to break up the surface, some ornament, such as a rose or fleur-de-lis, was inserted. I should also mention that solidity was obtained by making the ground of the curtain a whole colour, such as yellow or red, and we shall see this practice of getting a fully coloured base still further carried out in the decoration of larger and more important buildings. The most perfect system of this decoration by means of red lines only occurs in the little church of Molinot, near Rouen, but, unfortunately, it has been partly restored; another very perfect specimen is in the upper part of a house at Laon; but, indeed, it is found almost everywhere, and no decoration is more common. There are almost infinite varieties of this imitation stonework draper; sometimes the upright lines become small pillars; sometimes all the lines are doubled; sometimes one corner is cut off and filled with colour; and sometimes roses or other ornaments are placed in the centres of the stones.

As to the more artistic figure-work in the four colours, nearly every church, exhibiting work of the thirteenth or fourteenth century, presents us with some remains wherever the whitewash has been removed. Unfortunately, as these paintings were simply in *tempera*, i.e., in colours mixed with glue or size, the removal of the whitewash has also entailed the removal of the high lights and more delicate portions of the painting, to say nothing of what might have been their condition before the application of the whitewash in Queen Elizabeth's days; for we do know that Henry III. was continually ordering paintings to be repaired, which certainly does not say much for their solidity. It strikes me that it is much to be desired that some church, or churches—for the same cartoons, or studies, could

be used several times—should be treated in this manner. At present, we have no *riu media*: we either do nothing at all, or else do most highly-finished paintings, such as those in All Saints', Margaret-street, Mr. Parry's church at Highnam, and the roof at Ely. I have not mentioned the wretched texts upon zinc, or the wretched unmeaning ornaments in which some churches rejoice; for they are simply not art, and the sooner they are put down the better. What I want to see is a church painted right through in three or four simple colours, such as I have been describing, or in the style of Queen Marie's Psalter, where the outlines are done in black, and the shades of the draperies put in with murrey, purple, and green, the carnations and hair being touched in with brown.

Another simple way would be to work in what is called *grisaille* or *camien*, like Paolo Uccello did. Here everything is shaded in *terre verte* except the faces, which are like nature; the background being blue.

Now any of these ways would very much simplify the work, to say nothing of the saving made by using the cartoons over again in a more distant part of the country.

As to artists, of course one would not expect to get Academicians, but there are numbers of young painters who would be but too glad to exercise their talents in so useful and legitimate a manner, instead of trusting the labours of the whole year to the tender mercies of hanging committees and picture-dealers. I am convinced that the project is a sensible one, and one which will, sooner or later, be carried out.

We now come to the second or fully-coloured system of decoration, and here we divide into two distinct schools,—namely, the northern and southern. In the north we find deeply-cut mouldings and large windows filled with stained glass; the decoration in this case being confined to the lower arcade and to various portions of the vaulting. In the south, on the contrary, the windows are small and rarely filled with stained glass, while the arches are unadorned, and the wall surfaces broad, so as to present plenty of room for figure subjects. In this distinguishing between the north and south, I do not mean for a moment to say that these distinctions are invariable, for moulded buildings are found in Italy, such as the Cathedral at Florence, where all the decoration depends on the stained glass, the most beautiful in the world; or, again, that entire churches were not covered with paintings in the north, as Albi Cathedral. Still, as a general rule, I consider the distinction does hold good, and if you go in for mouldings, you must give up, to a very great degree, that wonderful effect produced by the walls being covered by a vast number of figures.

The worst result of all is, as usual, where a compromise has been effected, and of this the Sainte Chapelle is the worst example. The arcade below is all right; the windows are all right; but the pillars and the vaulting are all wrong. Had the former been marble, and had the latter been painted in a bolder manner, the effect would have probably been all right; but, as it is, the disjuncts on the pillars kill the statues, which are also coloured; and the roof looks as bad, with the little, diminutive stars, as it possibly can. Had Giotto been employed here, he would have certainly had the blue ground and the gold stars, but he would have also had the sun, the planets, the signs of the zodiac, and the labours of the year, for Giotto could not only paint but he could think, and could tell pleasant stories, and was, moreover, the friend of Italy's greatest poet.

But to return to our subject: small buildings in every country were often covered with richly-coloured paintings, such as are described in Henry III.'s orders to be done with good and exquisite colours. The Painted Chamber was an example of this: the walls appear to have been divided into a series of lands, one above the other, the upper ones being very much higher than the lower, so as to allow for perspective. These lands were filled in with histories of the Old Testament, done in very bright colours heightened with gold ornaments, the latter being burnished. I do not know whether they were worked on a raised ground, like those at St. Stephen's Chapel, but they would almost appear to be so from the drawings of the late Mr. Crocker. [Two original sets of drawings were made from the Painted Chamber—one by Stodhart, published in the *Vetusta Monumenta*, and another by the late Mr. Crocker for Sir G. Page Turner.] The paintings did not come down to the ground, but were finished in the usual manner, with a green curtain powdered with gold stars; and here the records furnish us with the information that the said green curtain was an afterthought, for it took the place of certain panels containing the species and figures of lions, birds, and other beasts, thus showing that they made mistakes just in the same manner as we do in the present day. In all probability they found out that the beasts, &c., were *de trop*, and spoiled the effect of the Great History, as it is called, above. The only way in which the two could have been reconciled would have been to have painted the panels and the animals in *grisaille*, like Giotto did in the chapel at Padua. The ceiling of the Painted Chamber was boarded and powdered with little quatrefoils containing heads. Now in the records we continually come upon notices of *wainscoting*, which was generally green with gold stars, but sometimes had borders, and occasionally circles with histories, and I very much suspect that this *wainscoting* referred to the boarding of the ceiling, and not to what we call *wainscoting* or a dado.

When, however, it was a larger building, such as a chapter-house or great chapel, the system was this: the arcade which ran round the bottom was highly coloured, that is, every portion was covered with some colour or other, but in every case a large quantity of gold was used, more especially in the prominent mouldings and foliage. At Salisbury chapter-house there are two prominent mouldings; one was gilt and the other was coloured a bluish green, but powdered with gold lions and *fleur-de-lis*, &c., so as to make a distinction; the hollows of these mouldings were coloured blue or black, and sometimes red. The shafts and bases were of marble; and, indeed, small shafts should almost always be of this material, as I scarcely ever remember seeing a painted one look well. This appears to have been well known anciently, for Henry III. directs the pillars of one of his halls to be painted like marble. The spaces under the arcades were generally painted with an imitation certain, as at Salisbury and St. Stephen's Chapel, Westminster, where, however, it was held up by angels. In the Lady Chapel, at Ely, it is simply coloured, and powdered with gold ornaments. The spandrels of the arcades were generally filled with sculptured groups; these were highly coloured and gilt, *i.e.*, a great deal of gold and a good deal of white, tinted and powdered with other colours, was used to detach them from the ground, which was a simple and rather dark colour, such as blue or red. Above this line of rich colour comes the windows and their vaulting shafts. These are of marble at Salisbury, and were at St. Stephen's Chapel. I am sorry to say were, for St. Stephen's Chapel ought to have been standing now, more glorious than ever. At St. Stephen's the shafts were Purbeck, but powdered with raised gold ornaments. About the middle of their height rose a coloured figure and canopy. At Ely there were a series of niches left white, but with coloured figures and coloured backgrounds. Between these piers are the windows; in all English examples the mullions are left white. Mr. Poynter, who had the advantage of viewing the Ste. Chapelle before the restorations, assures us that in that building they were coloured chocolate.

At Salisbury the glass was *grisaille* with coloured borders. At Ely all has been destroyed, except some canopies, but it is just probable that the figures might also have been in *grisaille*. Of St. Stephen's Chapel we know nothing. As to the vaulting at Salisbury, the ribs have very little colour on their fillets, and a very slight border on either side, but round the gilt bosses and at every angle of the vaulting are a series of ornaments on a chocolate ground; the colours used are yellow ochre, verditer green, and lake, but no blue or azure; the mass of the vault is covered with the imitation stone pattern. At Ely the vaulting is powdered with red roses. We know nothing of St. Stephen's, but most probably it had a flat roof, as there is very good reason for believing that there was another chapel over it, making, with the crypt, three chapels, one over the other.

Such was the general arrangement of colour in large buildings—*i.e.*, very bright at the arcade, and dying out at the roof. In great cathedrals the architects generally contented themselves with accentuating the hollows of the mouldings with red; gilding and picking out with red the caps, and occasionally the string-courses, while blank spandrels were sometimes filled with figures. As to the vaulting, the bosses were gilt and coloured, and occasionally a band on either side of the rib; or the rib is coloured and gilt for the distance of a foot from the bosses, as at Chartres. At Westminster there are gold bands on either side of the ribs, but the ornaments on them are certainly of the time of Sir Christopher Wren: but I have very great suspicions of all white and gold, which was the fashionable mode of colouring in his time, and, indeed, in our own—it is so safe. What I mean is that I do not think in the thirteenth century they would have placed gold on the stone without some coloured border or fillet, and I am the more convinced of this, as a careful inspection of the old roof-

screen at Salisbury, which is now coloured white and gold, disclosed the old colours underneath; the said white and gold being due to our friend, the architect of St. Paul's.

Before going to the south, I should say one word about roofs. The early roofs, as every one knows, were of a very high pitch, single framed, and boarded either to the tie-beam or to a very low collar. In our own country, Peterborough is the only church which possesses the original colouring; it may briefly be described as an imitation of a mosaic in black and white, the middle of the panels being filled with paintings. The subjects originally represented the planets and the Host of Heaven, but a restoration taking place in the fourteenth century, a number of bishops and kings were interpolated, and it is now nothing but a jumble. Afterwards the roofs lost their low collars, and were framed as half-octagons or half-decagons. A common way was to place mouldings on the boarding so as to divide the whole into a series of square panels, or sometimes ribs were nailed on in an awkward way as if it were vaulting, as at Trumpington, Cambridge. It is easy to suggest ways in which roofs of this description might be decorated, but I confess that I do not know any one of ancient authority—at least as old as the thirteenth century. If without ribs, they might be treated like the walls of the Painted Chamber, or with a series of histories or processions; or they might be painted blue, with gold stars interspersed with great circles containing stories or figures; but I have a strong idea that the ground of a good many ceilings was white, and that they were treated very much the same as the vaulting. The great halls, most probably, had their roofs unboarded, as we find Henry III. directing sundry of them to have the roofs *wainscoted* as far as the fifth couple of rafters from the chais.

A good many of the flat Norfolk roofs had the ground of the large panels painted white, the ornaments being in darker colours; but in this case a good deal of colour and gold was applied to the painted ribs which divided them.

In Mr. Brandon's "Timber Roofs," a drawing is given of Palgrave Church, where the colours are white, black, and red; here the pitch is rather high, and all the rafters show. Another is Knapton Church, Norfolk, where the ground is yellow, and the ornaments in black, red, and green. Neither of them look particularly well, and the latter is absolutely bad. By the way, I have often found a yellow colour on the woodwork of the latter end of the fifteenth century, and suspect greatly that it was a sort of attempt to imitate gilding. As to gilding itself, a coved roof, with a series of figures on a gold ground, would have a very magnificent appearance. The barrel wooden roofs, so common in France, would have a perpendicular ribs, which were often coloured, and on either side of these ribs ran a pattern like a cresting, and the space in between was filled up with ornaments, such as *fleur-de-lis*. Of course, the colours of these crestings and ornaments varied with the system of decoration. Thus, they were sometimes drawn on the oak itself, either with a very light or with a very dark colour; or, again, the body of the roof might be blue, and they would then require to be in white, shaded with various other colours.

We now come to the southern system of decoration. Here, as I said before, the windows and the architectural decoration are reduced to a minimum—indeed, very justly so, as a comparison between the lower and upper chapels at Assisi will testify—the lower, which is the plainer, being very much better in its effect than the upper, which has a very considerable amount of architectural ornament for an Italian church, although on this side of the Alps it would be considered rather a plain affair. The general tone of these finely painted Italian churches is blue, broken up by figures and architecture of light and tender colours, the divisions being made by white lines. This blue—which is always a pure and harmonious colour, and not the abominable spurious ultramarine, so much in use in the present day—is used in the walls as a positive colour, and on the walls as a background for pictures, where it may almost always be supposed to represent the sky—an illusion occasionally strengthened by one or two little clouds. So far is this carried out, that in these pictures where, from the nature of the subject, very little sky can be seen, there is generally a figure in dark-blue drapery to make up for it. At Siena, on the contrary, the ground of the pictures is gold, which, of course, would require a different treatment in the colour. At Assisi, and, indeed, in almost every case, the paintings start from a dado about 4 or 5 feet from the ground. Sometimes the dado is in real marble, but more generally it is an imitation in *camien*—*i.e.*, in white and black; it is represented as having a base and cornice, and is, moreover, divided into square, round, or lozenge-shaped panels, the interior of which is painted in imitation of the more costly coloured varieties—in fact, the whole is a great sham. In the upper chapel at Assisi we have the northern imitation drapery dado. Above the dado the wall is occupied by a series of pictures on a blue ground, but divided from each other by imitation architecture and mosaics. There are two sorts of these imitations—one where there are pillars, arches, and architraves, as at the upper chapel, at Assisi, and chapter-house, Pistoia; and the other, and far more common, where they assume the shape of long narrow panels of marble, enclosing mouldings, carvings, mosaics, and *l'idea* grounds to relieve the sculpture; the mouldings are shaded according to their position, but cast little or no shadow, and it is the high lights of these mouldings which constitute the white lines really dividing the several compartments. At certain intervals are divers forms, such as circles, quatrefoils, &c., which enclose busts, generally on a gold ground. These forms always occur at the inter-sections; but how many there may be between depends on the total length of the compartment. Now these imitation architectural bands divide the walls according to their shape into so many compartments, which were generally got as near the square as possible; the figures in the pictures are about three-quarters real size, and the height of the pictures about two figures. The last two observations apply only generally.

These bands go round all the great features of the architecture, but when any awkward space occurs, as in the spandrel of an arch or elsewhere, it is filled up either with a plain colour powdered with gold, or an imitation of marble; or a quatrefoil is introduced with a bust.

As there are no real mouldings in the building itself, the soffits of the arches are the only points to be considered. If the arch be wide, it is divided into a number of square compartments, always by means of the aforesaid architectural bands. The compartments may contain pictures, or two standing figures, or two figures under niches; or there may be a third band in the middle, so that there are still two figures, but each surrounded by a border. If the soffit of the arch be narrow, the whole becomes a band cut up at intervals by medallions, or it may be divided by horizontal bands containing half-figures alternating with foliage.

We now come to the vaulting. If barrel vaulting, it is generally erected like a wall and divided by bands. If, however, it be groined, there are three distinct things to be considered: first, the arch; secondly, the borders on either side; and, thirdly, the filling in. The ribs are treated like the bands we have just spoken of, but without the medallions; the general effect is a light grey, broken up by circles of bright colour.

The borders are in reality like the ribs, but with more colours, foliage, and medallions; however, the general effect is darker than that of the ribs. It is also as wide as the rib itself—in fact, much wider than in northern work.

The filling has almost always a blue ground, which is often used alone, powdered with gold stars, but then the stars are always larger than we make them now-a-days. If, however, figures be used, they can be applied in the following manner:—

1. Groups of figures, as in Giotto's work over the high altar at Assisi, where the group is represented as partially turned round so as to get side figures, and to make the composition less stiff.
2. Two figures, one at each angle, and a half figure at the apex.
3. One single figure surrounded by an aureole, the void spaces occupied by angels.
4. Rows of figures standing one over the other.
5. By various geometrical forms enclosing figures or busts. These forms can have their centres in the middle of spandrel, or in the intersection of the ribs. In the latter case they are more complex.

A few remarks on the figures themselves will conclude this part of the subject. The draperies are always tender, and light colours—murrey colour, light purple, yellow shaded with red; brown, and green occasionally, and still more rarely dark red and blue; but the prevailing colour is white shaded with some other colour, so as at a distance to produce the effect of a light and delicate tint.

The figures are kept flat with very little shade. In the early frescoes at Assisi the dark tint was laid on first of all, then the general tone was hatched on over that; and last of all, the very light and very dark touches were added. Afterwards the converse was adopted, *viz.*, to lay on the general tone, and then to hatch on the tint.

As to the flesh. In the early work, an olive green tint is put on first of all, then light flesh colour was hatched all over, leaving the green apparent only in the shaded parts, such as

the eyes, the shade of the nose, the lower jaw, &c.; red is used for the cheeks, with flesh colour to keep it down, and a very slight tint of brown is used in some parts to give the requisite depth; eyebrows are hatched upon this with Venetian red, and a thin line of Venetian red goes round shaded parts and marks the details.

It is curious that at a distance these faces with the green shadows are far more like life than those of the second period, where the green ground was covered over by brown in the shadows. The limbs of the heads are raised three-eighths of an inch from the ground, becoming, however, quite flat where they touch the face. They are indented with rays, and always gilt.

There are many more things connected with the Italian school of painting which, if time allowed me, I could dilate upon; but the real question for us in the nineteenth century is not only how did the Italians and our own ancestors decorate their houses and churches, but how is it that we don't do the same? I believe the fault rests, in the first instance, with the architects, who may be divided into two classes, viz., those who have no work to do, and those who have a great deal more than they can possibly do properly. Now, nothing can be expected from the former, for they have no chance; and as to the latter, of course they are perfectly helpless. I believe, in nine cases out of ten, could the architect find leisure, and could he draw the figure sufficiently well to give his client a notion of what he intends, that he could get whatever paintings and decorations he thinks desirable. But the architect is not the only one in fault; the decorator is equally deficient—leave him to himself and see what crude colours he puts on—emerald green, bright vermilion, the most dazzling white, and, lastly, the abominable French ultra-marine, all in juxtaposition. The fact is that he is ignorant that every colour should be more or less broken up and worked into other colours; but, no, there are the drawers filled with the usual pigments, and he uses them as he finds them; indeed, the immense want of art-education becomes more apparent every day. Ask the decorator why he uses crude colours and cannot do anything approaching to the figure? Ask the engraver why he mangles your design? The answer is, that he has never been taught. Follow up your question by demanding why he does not take advantage of the various schools of design? and the reply will be that he did go, and got disgusted and tired of it; the real fact being that instead of being put at once to the figure, he has been set to work on Dyce's outlines, to draw one side of a leaf exactly like the other side. In fact, it is almost impossible to estimate the amount of damage done by that one book, published, I admit, by a most clever man, and with the best intention; the authorities having forgotten the saying of another very clever, but very unpopular man—viz., Haydon, who declared that the student who can draw a head can draw a leaf, but the man who can draw a leaf cannot necessarily draw a head.

For my own part, if we are to advance at all in the arts, I believe it will only be by a most general teaching of the human figure to all employed in the fine arts, whether architects or artisans. It is very true that colour is a gift of the good God, but he has implanted the germs of it in the majority of us, and if we cannot all be Glottos or Titians, at least we can do our best to improve the talents confided to us. For to whom much is given much will be expected, and it is for this reason that I consider Captain Fowke a very ill-used and much-abused man. People judge of him as an architect, and blame him accordingly. On the contrary, he is no architect, but simply a military engineer, and his building is a very fair one for a military engineer. If it is bad, and there is no doubt of its being exceedingly so, the fault is not his, but his employers. In the same manner if, after a proper amount of good teaching of the human figure, the English artisan cannot compete with his rivals over the water, I give him up; but, up to the present time, he has not had it, and therefore the weight of the blame must fall upon those who neglect to teach him properly.

Reviews.

Wenlock Priory, Salop. By EDWARD ROBERTS, Esq., F.S.A., F.I.B.A., &c. A FEW months since we noticed Mr. Roberts's admirable account of Lilleshall Abbey, and have now before us* the results of his investigations at the now ruined priory at Wenlock, architecturally one of the most interesting of monastic establishments, and well worthy of the trouble and time, and something more, too, which Mr. Roberts has devoted to the study of its remains, which even now extend over the greater portion of an acre of ground, while it is highly probable that other and not unimportant structures have entirely disappeared, their sites being now occupied by houses. The church alone is 332 feet in length by from 61 feet 3 inches, in the nave, to 62 feet 4 inches in the choir, in width. Mr. Roberts's figures do not agree with those of former writers, but they have been taken from actual measurement on the spot, and we have reason to believe that they are correct. The church is cruciform, with aisles to the nave and choir. "Entering the place where formerly was the great west door, we come upon one of the grandest architectural effects in the county;" on the left are the ruined bases of seven large pillars, forming eight bays, and on the right of the corresponding piers three still remain perfect, and carry arches and arcades to nearly the full height of the former structure; over the portion of the south aisle thus preserved there is a vaulted room (a drawing of it is given) of singular interest and admirable design; the purpose of the room is doubtful, and the only conclusion arrived at is that it was used as a vestry for early morning services. It may, however, says Mr. Roberts, have been the monks' parlour, as there was a distinct stair from the cloister, and stone seats.

The chapter-house contains one of the finest examples of interlacing arches in the kingdom; each side is divided into three bays by main shafts and vault ribs, grouped six together; the bays being each subdivided into five bays with three tiers of arches. There is a wonderful variety in the designs of the Norman capitals, which are nearly all different, though in several cases a design is found repeated in another part of the arcading. The remains of what must have been the infirmary is now used as a cow-house; about the walls are a few remnants of fine old Norman work.

Mr. Roberts's account gives us a plan of the buildings, so far as they can be traced; a view, as before mentioned, of the room over the south aisle, a section of the chapter-house, together with five lesser subjects, one of which, a base stone with incised lines, is, perhaps, a unique example as regards the subject of ancient architectural drawing.

Tables for the Purchasing of Estates, Freehold, Copyhold, or Leasehold, Annuities, Advowsons, &c., and for Renewing of Leases, &c., &c. By WILLIAM INWOOD, architect. With considerable additions by M. Feder Thoman. Seventeenth Edition.

The Land Valuer's Best Assistant, being Tables on an Improved Plan for Calculating the Value of Estates. By R. HUDSON. A new edition with additions and corrections.

WE are frequently asked to point out works for the guidance of those engaged in the valuation of estates, leases, and lands, and may here answer, or refer to a source where will be found answers to many questions on the subject for correspondents, by recommending the two little books before us, published by Messrs. Lockwood and Co., Stationers' Hall-court. Inwood's book is well known as a

reliable authority; the present edition contains many additional tables, of use to all who may be employed in the valuation of estates. Mr. Hudson's book will be found to lead to a very considerable saving of time.

Thebes: its Tombs and their Tenants, Ancient and Present, including a Record of Excavations in the Necropolis. By A. HENRY RHIND, F.S.A., &c. Longman and Co.

WE regret that the demands on our space will not allow us at present to do much more than commend this work to the notice of our readers. The accomplished author gives the result of excavations which he made at Thebes, and a precise account of a large family tomb of an official personage, which a long, and at times, most discouraging search brought to light in an undisturbed condition. It is part of the plan of the work that "the various details should exhibit some realisation at once of the conditions under which, and those by means of which, Egyptian relics have been procured. Thebes has, therefore, been treated of introductorily as the ancient capital, but chiefly as the central sources which have been archaeologically so productive." It is difficult to say which is the most important investigation entered into by the author; but no discovery is of greater interest than that of the undisturbed tomb mentioned above. Here the author discovered, after great labour and many discouraging disappointments, an excavated tomb, reaching to a distance of over 180 feet into the rock. It was reached after penetrating through two distinct passages 125 feet in length, and was approachable only by a shaft 20 feet deep, in which hung cords by means of which the tenants of the tomb had been lowered to their resting-places ages before. It was in the outer passage leading to this tomb that Mr. Rhind discovered a funeral canopy of wood, brightly painted, and in perfect preservation. Representations of such canopies had been seen by the author, but he believes that there is no evidence of any actual example having before been met with. The book makes a handsome volume, and its contents are a valuable contribution towards the illustration of Egyptian art.

Correspondence.

BIRMINGHAM FREE LIBRARY.

SIR,—As the statements contained in the letter of Mr. E. M. Barry, which appears in the BUILDING NEWS of Friday last, are not in accordance with the facts, and might, if uncontradicted, be prejudicial to the competition which the Free Libraries' Committee have invited, I beg to request you will insert in your ensuing number the following observations in reply.

In 1855 the Council of the Birmingham and Midland Institute commenced the erection of a suitable building for the accommodation of their body, in accordance with designs prepared by Mr. E. M. Barry. A portion of the building having been erected, the Council of the Institute were, through exhaustion of their funds, compelled to suspend the further progress of the works, and ultimately to abandon their intention of completing the building. Five years afterwards the Corporation of the borough being in quest of a site for their proposed Free Libraries, the land unbuild upon adjoining the Institute was offered for that purpose by the Council of the Institute, upon condition (in order to avoid incongruity of design) that the Library should be erected in uniformity with their building. The Town Council did not accept the transfer of the land until plans had been obtained, and an estimate of the cost of the building had been laid before them. These plans were prepared by Mr. Barry, and the total cost (exclusive of cellars) was estimated by him to be £10,500. The Town Council being satisfied with the extent of the accommodation and the cost, accepted the transfer of the land.

Mr. Barry's charges "for attending upon the Libraries' Committee for two sets of designs prepared in accordance with instructions received, and a further set of drawings prepared for the purpose of being submitted to the Town Council, and his travelling expenses," amounting to £45, were paid by the Corporation, and the terms upon which he undertook to superintend the erection of the buildings were arranged.

Builders were invited, by advertisement, to compete; and, on the tenders being opened, the lowest was found to be £17,900 (exclusive of cellars). Mr. Barry was then requested by the Free Libraries' Committee to report, in detail, the cost of the erection of certain portions of the building, and what alterations might be made to effect a reduction in the cost; whereupon Mr. Barry attended the Committee, admitted there was a mistake in his estimate, and expressed his willingness to abandon all professional charges in the event of the Town Council refusing to vote the additional sum required to carry out his plan. Several modifications for reducing the cost of the building were suggested by that gentleman. On the 11th November last, Mr. Barry addressed a letter to the Committee, in which he stated that, provided the gallery of art and cellars were omitted and certain alterations suggested by him adopted, the remainder of the building might be erected for £12,250—this sum being still considerably in excess of the amount of his original estimate for the whole building. The Committee again applied to Mr. Barry to revise his designs, so as to obtain a further reduction, if possible, in the cost of the buildings, and also to report if, by any re-arrangement of the plans altogether, the requisite accommodation could be afforded for the amount of his estimate; to which Mr. Barry replied that "he could make no alteration or arrangement which would effect a greater saving in the cost than as before detailed."

As the alterations and omissions proposed by Mr. Barry involved the abandonment of a most important feature of the scheme approved by the Council, it became the duty of the Libraries' Committee to bring the whole subject before the Town Council and to ask for further instructions, which they did in a report presented at a meeting held on the 4th day of March last, when the Council, deeming it desirable to make an effort to obtain the erection of the whole of the buildings for the sum already voted for that purpose, invited architects to forward new plans, specifications, and estimates.

Mr. Barry states that he offered to prepare new plans to suit the financial exigencies of the case. So far from this being the fact, it will be observed that Mr. Barry positively assured the Committee that he could make no alteration or arrangement which would effect a greater saving in the cost than he had already made.

The plan accompanying the instructions to architects is simply one of the site, indicating the position of the adjoining buildings, and is not, as Mr. Barry

* *Collectanea Archaeologica*, British Archaeological Association.

states, copied from a block plan of his. The Council has no plans of Mr. Barry's in its possession. The whole of his drawings, specifications, and estimates, were returned to him at his own request in March last, although, as will be seen, the sum of £45 was paid by the Council for such plans.

With regard to Mr. Barry's intimation that he has placed himself in the hands of his solicitor, I would state, for the assurance of architects, that the Council have taken no steps in the matter of this competition unadvisedly.

Birmingham, April 30th, 1862.

THOMAS STANBRIDGE,
Town Clerk.

ARCHITECTURAL ALLIANCE.

SIR,—I was very glad to observe your remarks in to-day's BUILDING NEWS on this subject. I assure you the promoters of the scheme have not given it up by any means, but, on the contrary, have been silently organising the "Alliance" as far as possible, in order to have a conference during this auspicious season.

As you observe, it was intended to have held a conference last year, but it could not be accomplished, owing to our not having received replies to all our circulars in time. It is, however, now determined to hold the first meeting or conference on Tuesday, July 1st, and in the BUILDING NEWS and Builder will appear advertisements calling attention to it.

The scheme has been very well received by the profession, and we have already in the Alliance the Institute of Scotland, the London Association, and all the provincial associations of a professional character that we know of, in the United Kingdom; but if there are any we have missed we shall be very glad to receive them into fellowship on their making themselves known to us; and I may add that we hope soon not only to have "the Institute" one of us, but to organise an association in every county or large town where one does not at present exist.

I enclose you a copy of the "outline scheme," in case you should think fit to give it again to your readers.

Darlington, May 6th, 1862.

J. P. PRITCHETT.

Suggested Outline of a Scheme for Forming an Architectural Alliance.

1. That it be called "The Architectural Alliance."
2. That although for the present it is desirable to confine it to the United Kingdom, the extension of its operation to other countries shall be kept in view.
3. That its object shall be to promote united action among the otherwise isolated architectural societies, and to aid the establishment of new local societies where not now existing.
4. That it shall take cognizance of all matters affecting the interests of the profession. That for this object it shall especially direct its attention to the present unsatisfactory mode of conducting competitions, and shall endeavour, by the publication of a scale of charges, to regulate the rates of professional remuneration.
5. That all architectural societies giving in their adherence at or before the first meeting, shall constitute the nucleus of the Alliance; and in future all architectural societies shall be eligible for election in the mode hereafter provided.
6. That any society wishing to join, shall be proposed, in writing, by a society already in the Alliance through their secretary; that such proposal shall be sent to the secretary of the Alliance at least one month before the annual meeting, and shall state the title of the society proposed, and the names of its chairman and secretary. The name of the society so proposed shall be inserted in the notice convening the meeting, when the election or rejection of such society shall be decided by ballot.
7. That the business of the Alliance shall be conducted by a president, vice-president, treasurer, honorary secretary, and delegates from each society in the Alliance. The delegates shall consist of the chairman of each society in the Alliance (*ex officio*), four members appointed by the Royal Institute of British Architects, three members by the Scottish Institute, three by the Architectural Association of London, and two by each provincial society, or any less number they may see fit to appoint; all to be appointed annually.
8. The president, vice-president, treasurer, and honorary secretary to be elected annually by ballot by the delegates. All correspondence shall be conducted by the secretary of the Alliance and the secretaries of the various societies composing it.
9. That the annual meeting shall be held on the first Tuesday in June in each year, and other meetings may be held as hereafter provided for.
10. All members of each society in the Alliance shall have the right to attend the meetings of the Alliance on introduction personally by any delegate, or by a card of introduction from one of them; but delegates only shall have the power to speak or vote.
11. Questions may be brought under the cognizance of the Alliance by any society writing, through their secretary, to the secretary of the Alliance, who shall then ascertain the views of the other allied societies and report to each the general feeling. On the requisition of a majority of the councils or committees of the various allied societies, the secretary shall call a special meeting of the delegates for the consideration of any question that may arise. To such special meetings provincial societies may send all their delegates, or one delegate with three votes, or may exercise their three votes by proxy through any other delegate.
12. That the officers of the Alliance shall prepare a report of the proceedings of the Alliance for each year, to be laid before the annual meeting, and it shall be competent for such meeting to alter or amend it, and to order it to be printed if they see fit, in which case a copy shall be sent to each member of every society in the Alliance.
13. That every society publishing a report of its proceedings, or of any paper read before it, shall present a copy to every other society in the Alliance.
14. That any member of a society in the Alliance shall have the privilege of attending (but not of speaking or voting) at the meetings of any other society in the Alliance, provided such member be introduced by letter from one of its own delegates, or personally by a member of such society.
15. That each society shall pay the expenses of its own correspondence, and shall make arrangements with its delegates as to their expenses, and the expenses of the Alliance (stationery, postage, printing, &c.) shall be borne equally by the allied societies.

DUNDEE NEW CEMETERY.—Plans have been obtained for laying out the new cemetery for the parish of Dundee. The site of the cemetery is a field of about twenty acres. The plans show two methods of laying out the ground, the one dividing it into parallelograms, while in the other the divisions are of a curvilinear form. In both there is an extensive terrace about the centre of the ground, running from east to west. The principal entrance in both plans is from the centre of the southern boundary. In the designs approved by the Committee, the principal or carriage gateway is about twelve feet wide, and on each side there is a smaller gateway, each having a moulded pointed arch, and jambs on the piers between the openings. At each angle of the gateway buttresses are carried up, terminating in octagonal turrets, the extreme height being 42 feet. Over the arches, and extending to the principal cornices, the surface is enriched with perpendicular Gothic panelling, the parapets and face of the buttresses being treated in a similar way. On the west side of the entrance there is a lodge, two stories in height, for the superintendent, and on the opposite side a smaller lodge, one story in height, for workmen's accommodation.

TENDERS.

MANSION, TORQUAY.

The tender of Messrs. J. Grant and Son, builders and contractors, has been accepted for building the new wing and other alterations at Lupton House, Devonshire, the property of Lord Churston. A. Salvin, Esq., of London, is the architect.

DWELLING HOUSES, TOTTENHAM.

For the erection of four houses, High Cross, Tottenham, for Mr. Keasley. Mr. J. Rowley, architect, 17, St. Helen's-place, City.

Rivett	£1,593	Cushing	£1,152
Humphreys and Son	1,190	Barker	1,150
Clarke	1,160	Chapman (accepted)	1,115

CHURCH, SURREY.

For the erection of Christ Church, East Sheen, Surrey. Mr. A. W. Blomfield, M.A., architect. Quantities by Mr. J. A. Bunker.

Bird	£4,787 0	Myers and Sons	£4,305 0
Goodale	4,700 0	Child and Son	4,185 0
Nicholson and Sons	4,555 0	Chincock Brothers	3,991 5
James Long	4,389 0	Cartier	845 0
Turner and Sons	4,359 0		

CHURCH, GLOUCESTER.

For building Little Compton Church, Gloucester. Edward G. Bruton, F.R.B.A., architect.

Compton	£1,330	Young and Co.	£1,025
Denner	1,050	Claridge	950
Bartlett	1,040	Cowley	941
Selby	1,031		
Architect's estimate	£1,025.		

CHAPEL, MARKET RASEN.

For the erection of a Wesleyan Chapel at Market Rasen. The tender of Mr. Jackson, of Lincoln, for £2,000 and the old materials of the chapel, was accepted.

VILLA, DORKING.

For erecting a small villa at Dorking. Poulton and Woodman, architects, Reading.

Sheppard	£1,770 0 0	Perry	£1,623 0 0
Biggs	1,760 0 0	Lynn and Dudley	1,560 0 0
Mathews	1,760 0 0	Shearman	1,560 0 0
Woodroffe	1,745 0 0	Hamblin	1,519 10 4

ASYLUM, PRESTWICH.

For the execution of the works in connection with the proposed enlargement of the County Lunatic Asylum at Prestwich. Mr. Charles Holt, architect, Bolton.

Main block.		Laundry.		Total.

Wood Bros.	5,853	Curtis	5,220
Hall	5,800	Perry and Judson	5,194
Brown	5,790	Jacobs (accepted)	5,172
Ennor	5,689	Sawyer	4,980
Myers	5,620		

COMPETITIONS AWARDED.

LAYING OUT GROUND, TRANMERE.

The decision that took place on the 15th ult., on the plans submitted by about 30 competitors for the laying out of the fine estate in Higher Tranmere, on the slope of the hill facing South Oxtan, recently purchased by the Tranmere Freehold Land Society, was to the effect that the committee unanimously awarded the first premium of £20 to Messrs. W. Lowndes-horough and J. A. Meakin, of Liverpool, and the second premium of £15 to Messrs. Underwood and Billing, of Clifton, near Bristol. We understand that the committee had selected another plan of the former gentlemen for the second premium, but when it was discovered that they had already gained the first, the rule of prize giving adopted at various public institutions was followed, and the second prize given to the next in order of merit.

COLLEGE, SHEFFIELD.

The Building Committee of the proposed Methodist New Connexion College, Sheffield, after having invited sundry architects to submit plans in competition, have selected those by Mr. William Hill, of Leeds. The second premium of £30 was awarded to Mr. Flockton, of Sheffield, and the third premium of £10 to Mr. Scrivener, of Hanley. We understand that the works are to be immediately proceeded with under Mr. Hill's superintendence.

COMPETITIONS OPEN.

CATHEDRAL.

CORK.—Architects are invited to furnish designs for the erection of the cathedral of St. Finbar, Cork, at a cost not exceeding £15,000. A premium of £100 will be given for the best and most approved plan, and £50 for the second. Plans and designs to be sent to the hon. secretaries, Ven. the Archdeacon of Cork, Rev. J. N. Woodroffe, or T. M. Osborne, Esq., Cork, not later than the 1st August next. Further information and a plan of the site may be obtained on application to W. C. Bennett, Esq., notary public and Chapter clerk, 15, South-mall, Cork.

SCHOOLS, &c.

LANCASHIRE.—For the erection of the proposed new schools, vestries, &c., Rawtenstall, Lancashire. Plans, &c., with Thomas Simpson, architect, Nottingham, to May 10th, inclusive; and at Rawtenstall, on application to Thos. Hoyle Whitehead, Esq., on and after the 12th May. Printed quantities will be supplied on application to the architect. Tenders to be delivered to Thos. Hoyle Whitehead, Esq., Rawtenstall, on or before the 21st of May.

LIBRARY AND READING ROOMS.

BIRMINGHAM.—The Free Libraries' Committee of the Council of the Borough require plans, sections, specifications, and estimates for the erection of a free reference library and reading-rooms, lending-library and news-room, and gallery of art, upon the piece of vacant land adjoining the Midland Institute Building, with an elevation uniform with the said building. Intending competitors are requested to send in their plans, specifications, and estimates, under cover to Thomas Standbridge, town clerk, Town clerk's office, Temple-street, endorsed "Plans for Free Reference Library Buildings," on or before the 16th June. Particulars of the accommodation required, and of the conditions of competition, together with a lithographed plan of the site, may be obtained on application.

MEMORIAL.

GLOUCESTER.—The committee appointed to carry out the Hooper Memorial, at Gloucester, invite sculptors to submit models of designs for the figure of Bishop Hooper, which is intended to be placed under the canopy of the monument just erected in the churchyard of St. Mary de Lode, Gloucester. The models or statuettes to be carved in stone, and to be one-quarter the real height (7 feet). The author of the best design, approved by the committee, will be appointed to execute the full-sized figure; and the sum of ten guineas will be awarded for the second-best design.

DRAINAGE.

KINGSTON.—The Corporation of the borough of Kingston-upon-Thames invite engineers and others to submit plans, specifications, and estimates for a thorough and complete system of drainage of the borough, and offer a premium of £100 for the plan approved, retaining the liberty to carry it out or not. The plan approved to become the property of the corporation. The system of drainage to blend, as far as practicable, with existing drains, to plans and descriptions of which are at the Town Clerk's office. The plans, Clerk's office also the commission for carrying out the works, to be sent to the Town &c., stating on or before the 17th day of May.

VICARAGE.

NOTTS.—Plans and estimates are required for the erection of a new vicarage house at East Retford, on the following terms:—1. That the requirements of the Ecclesiastical Commissioners as to the materials employed, height of rooms, thickness of walls, &c., be complied with. 2. That the estimate, exclusive of architect's commission, do not exceed £1,000. 3. That architects, on sending in plans and estimates, be prepared to find, if required, a respectable contractor willing to carry out the design at the estimated cost. 4. A general statement of the ground plan, number of rooms, &c., &c., required will be supplied to any architect who purposes to send in a design and estimate. 5. Plans not accepted will be returned to the architect. The arrangements will probably be complete for the building to be commenced in June. Plans and estimates must be sent in on or before May 17th, to Rev. Arthur Brook, the Vicarage, East Retford.

CONTRACTS OPEN.

MARKET BUILDINGS.

BATH.—For the erection of iron roofs, masonry, and other works involved in the reconstruction of the Bath provision markets. Plans, &c., on application to Hicks and Isaac, architects, 13, Northgate-street, Bath, from May 3. Sealed tenders to the Town Clerk, Guildhall, Bath, for the separate trades, endorsed, "Tenders for the reconstruction of Markets," by the 15th of May.

BANK.

LINCOLNSHIRE.—For the erection of a bank and manager's house at Spalding, for the Stamford, Spalding, and Boston Banking Company. Particulars from Mr. William Eve, surveyor, 3, Union-court, Old Broad-street, E.C. Tenders on or before the 17th May.

CHURCHES.

YORK.—For the erection of a new Catholic church and presbytery, to be built in the City of York. Plans, &c., at the Very Rev. Joseph Bender's, Precursor's-court, Petergate, York; or at the office of the architect, George Goklie, Esq., 34, Gloucester-place, Portman-square, London, from May 5 until May 14, on which day sealed tenders are to be forwarded to the Very Rev. Joseph Bender, Precursor's-court, York. Bills of Quantities may be obtained on application to Thomas Wilson, Esq., No. 7, Hanover-square, Sheffield.

OXFORD.—For the enlargement and repewing of the Church of St. Aldate, Oxford. Plans, &c., at 40, Pembroke-street, Oxford, or at the office of Mr. John T. Christopher, architect, No. 10, Cannon-street, E.C., London. Sealed tenders to be sent on or before 14th May, addressed to the Rev. the Rector of St. Aldate's, 40, Pembroke-street, Oxford, and endorsed "Tender for works at St. Aldate's Church."

IRELAND.—For enlarging the church of Drumgoon, County Cavan; for repairing the churches of Cloncha (Mallin), Drumholm (Balintra), Gollard (Laghey), County Donegal; Mohill, County Leitrim; Tybeline, County Roscommon; Killery-Killoran, County Sligo; Rathaspeck, County Westmeath; and for repairing and painting externally the churches of Olencly, County Donegal; Clontibret, Magheraclooney, Tullycorbet, County Monaghan. Plans, &c., with the resident Ministers of the parishes. Each proposal to be forwarded on or before the 15th instant, sealed, prepaid, and addressed thus:—"Proposal for ——— the church of ———. The Ecclesiastical Commissioners for Ireland, Dublin."

WILTS.—For taking down, and partially rebuilding and enlarging, the parish church at Sutton Mandeville, Wilts. Plans, &c., on application at the rectory.

IRELAND.—For rebuilding the church of Oasterrahan, County Cavan; for enlarging the church of Castelnock, County Dublin; for works to be executed at the churches of Shircock, County Cavan; Youghal, County Cork; Dunfeeny-Kilmore, Moy, County Mayo; Kilglass, Killybeg, County Sligo; and for painting internally the church of Athboy, County Meath. Plans, &c., with the resident ministers of the parishes. Tenders sealed, prepaid, and addressed thus:—"Proposal for ——— the Church of ———. The Ecclesiastical Commissioners for Ireland, Dublin," on or before May 16.

IRELAND.—For the erection of a new Catholic church, to be built at Kenmare. The parish priest will show the plans and specifications, and will receive tenders up to June 1.

WARWICKSHIRE.—For repairing and restoring the parish church of Long Compton, Warwickshire, near Chipping Norton. Plans at the Vicarage, Long Compton, to the 17th May inclusive, sealed tenders, directed to the Rev. H. Lanphier, Long Compton Vicarage, Shipston-on-Stour, on or before the 24th May.

STROUD.—For the several works required to be done in re-building the parish church of Stroud. Plans, &c., at the office of Mr. J. G. Bland, architect, Birmingham. Tenders to be delivered on the 20th May. Copies of drawing and specifications will also lie at Stroud for inspection, and may be seen on application to the architect.

ISLEHAM.—For the repair and restoration of Isleham parish church, near Newmarket. Plans, &c., at the Vicarage, Isleham. Tenders to be delivered at the Rutland Arms, Newmarket, on the 20th May, at 12 a.m.

DEVON.—For altering and restoring the parish church of St. Giles-in-the-Wood, near Torrington. Drawings &c., with Mr. Ebdon, at the school, adjoining the church, or at the offices of the architect, 50, High-street, Exeter. Tenders to the architect, Mr. John Hayward, on or before the 13th May.

YORKSHIRE.—For the erection of a new north aisle, and for the re-roofing, repairing, and restoration of Kirk Smeaton church, near Womersley. Drawings, &c., at the school-room, at Kirk Smeaton, to the 14th May inclusive. Sealed tenders are to be delivered to Messrs. J. B. and William Atkinson, architects, 93, Micklegate, York, on or before the 15th instant, at 9 a.m.

CHAPELS, &c.

SUSSEX.—For the erection of two chapels and sexton's lodge, and out-offices connected with the Burial Board for the parish of Broadwater, in the county of Sussex, on land at Broadwater, intended to be used as a cemetery for the parish of Broadwater and town of Worthing, together with the boundary walls and other works connected therewith. Plans, &c., with Mr. W. Verrall, clerk to the Burial Board, Worthing. Sealed tenders endorsed, "To the Burial Board for the parish of Broadwater, Tender for Works," to be delivered at the clerk's office, 15, High-street, Worthing, before 5 o'clock on the 20th May.

SCHOOLS, &c.

LANCASHIRE.—For the erection of the proposed new schools, vestries, &c., at Rawtenstall, Lancashire. Plans, &c., on application to Thomas Hoyle Whitehead, Esq., on and after the 12th May. Printed quantities will be supplied on application to the architect. Tenders to be delivered to Thomas Hoyle Whitehead, Esq., Rawtenstall, on or before the 21st May.

DWELLING HOUSES, &c.

BERKS.—For repairs and alterations to the Bridge Estate premises in the High-street, Wallingford, formerly known as the Bear Inn. Plans, &c., from Mr. J. Kirby Hedges, town clerk, Wallingford, or at the offices of Messrs. Clacy and Son, architects, Reading. Tenders sealed, and endorsed "Tender for Works, Bridge Estate, Wallingford," to be sent to Mr. Hedges, on or before the 13th May.

HUNSTANTON.—For the erection of three first-class, four second-class, and four third-

class houses, at Hunstanton, for the Hunstanton Building Association (Limited), according to plans, &c., prepared by Mr. Butterfield. Plans, &c., at the office of Mr. J. S. Valentine, C.E., 17, Parliament-street, Westminster; or with Partridge and Edwards, Solicitors to the Association, King's Lynn; or copies will be forwarded on prepayment of 21s. Tenders, stating a separate amount for each class of house, marked "Tenders for Building at Hunstanton," to be delivered to the solicitors on or before the 14th May.

DUMFRIES.—For building an addition to the miller's house at Glencesslin Mill, Dumfries, for repairing and building new office houses there, and for repairs of considerable extent on the kiln and mill. Plans, &c., Sir William Brown, Bart., solicitor, Dumfries, to whom tenders by the 18th inst.

HANTS.—For the erection of a villa residence at Botley, Hants. Plans, &c., at Mr. Harding's Harness Manufactory, Botley, on and after the 22nd instant. Tenders to be delivered at the office of Mr. John Colson, architect, St. Swithun-street, Winchester, on or before the 5th June.

READING.—For the erection of a villa residence, with stabling and outbuildings, near the Eastern Avenue, Whiteknights, Reading. Plans, &c., with Cooper and Goulding, architects and surveyors, 5, Market-place, Reading.

FARM BUILDINGS.

WILTS.—For the erection of farmhouses, extensive farm steadings, and numerous labourers' cottages upon the Earl of Pembroke's estates, Wilts. Apply at the offices of Mr. Samuel Clarke, architect, engineer, and surveyor, the Corn Market House, Salisbury.

WILTS.—For a large farmhouse, homesteading, &c., upon Banerton Farm, near Salisbury. Tenders to Mr. Clarke, Corn Market House, Salisbury, on or before the 19th May.

ASYLUM.

WILTS.—For the erection of additional buildings sufficient for the accommodation of about 80 Patients, at the Wilts County Lunatic Asylum. Plans, &c., at the Asylum, and further information obtained at the office of Mr. Peniston, the County Surveyor, at Salisbury. Sealed Tenders, addressed to the Committee, to be sent to the Clerk to the Visitors at the County Asylum, before ten o'clock.

DUBLIN.—For erecting a new Asylum at Leeson Park for the Board of Governors of the Old Men's Asylum, according to the Plans, &c., to be seen at the office of the Architect, William G. Murray, 68, Lower Gardiner-street, Dublin. Tenders to be addressed to T. Collins, Hon. Sec., 28, Harcourt-street, and forwarded on or before the 20th May, endorsed "Tenders for Building."

WORKHOUSE.

HANTS.—For the works required to be done in making certain alterations in, and additions to the Alverstoke Workhouse. Plans, &c., at the Boardroom of the workhouse on and after the 15th May, or at the office of Mr. Thomas Hellyer, Boonverie House, Ryde, Isle of Wight, architect, of whom every information may be obtained, and Bills of Quantities may be had.

WAREHOUSE FRONT.

LONDON.—For new river frontages to the granaries and warehouses of the Oil Mills abutting on the Thames, at Limehouse Hole, between Limekin Dock and the Limehouse Entrance Lock of the West India Docks, the property of Messrs. John Garford and Sons-Plan, &c., on the premises, or at the office of Mr. J. B. Redman, C.E., 5, New Palace yard, Westminster. Tenders on or before the 13th May.

BRIDGES.

GATEHOUSE.—For building a new bridge over the river Fleet, at Castramont, in the parish of Girthorn. Plans, &c., with Mr. Ewart, Bank of Scotland, Gatehouse, who will receive offers till the 20th May.

POLICE STATIONS.

SIDMOUTH.—For the erection of a police station, &c., at Sidmouth, Devonshire. Plans, &c., with Henry Ford, Clerk of the Peace, Castle of Exeter, and at the office of Messrs. Radford and Williams, Clerks to the Justices, Sidmouth. Sealed tenders, endorsed "Tender for Sidmouth Police Station," to be sent to Mr. Ford, on or before the 3rd June.

RAILWAY WORK.

INVERNESS AND PERTH JUNCTION RAILWAY.—For the construction of the two remaining sections of the line, viz.:—The Kingussie contract, extending from Kilarua Post-office to the south side of the river Spey, measuring about 13 miles or thereby, comprising about nineteen small bridges and culverts, with a timber viaduct across the Spey. The excavations and embankments consist of about 470,000 cubic yards. The Dalwhinnie contract extends from the south side of the Spey to the boundary of the county of Perth, measuring 15 miles or thereby, and consists of thirty-two small bridges and culverts, and about 450,000 cubic yards excavations and embankments. The rails, chairs, sleepers, spikes, fish-plates, and bolts will be supplied by the Railway Company. Drawings, &c., at the office of Joseph Mitchell, Esq., C.E., Inverness, from whom, or from the assistant-engineer on the line, duplicate schedules may be obtained, at £2 2s. each. The line is staked out at distances of every 100 feet, according to the working sections. The deepest cuttings are also pitted to ascertain the nature of the materials in the excavations. An assistant-engineer will be at the County Marsh, near Dalnacardoch, on the 20th May, at 10 o'clock a.m., to accompany the contractors over the Dalwhinnie contract; and at Spey-bridge, near Kingussie, on the 21st, to go over the Kingussie contract; and to point out the works and sites of the bridges. The draft contract proposed to be entered into will be seen with the assistant-engineer, or at Mr. Mitchell's office. Sealed tenders, addressed to the secretary, and marked "Tender for Inverness and Perth Junction Railway Works," "Dalwhinnie," or "Kingussie Contract," as the case may be, must be lodged at his office, on the 28th May, at 4 o'clock p.m.

SEWERAGE, &c.

MAIDSTONE.—For the construction of a sewer in Week-street and Earl-street, Maidstone, about 140 yards in length. Tenders to Messrs. Beale and Hoar, Maidstone, on or before 13th May. A plan and specification of the work may be seen at the office of Mr. Bulmer, Maidstone.

ROADWORK, &c.

WOLVERHAMPTON.—For levelling, sewerage, paving, channelling, and forming New Hampton-road, in the borough of Wolverhampton, in length about 2,074 yards. Plans, sections, &c., with the borough surveyor. Tenders to the surveyor's offices, Town-hall, North-street, on or before the 16th May, addressed to the "Chairman of the Streets Committee," and endorsed "Tender for New Hampton-road."

TO CORRESPONDENTS.

We cannot undertake to return rejected communications. **WORKS IN PROGRESS.**—We shall feel obliged to any of our readers who will favour us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

M. R. J. B. A.—In type.
C. J. P.—Received. Thanks.
A. N.—Shall receive attention.
H. B. J. B.—Thanks.
C. S.—Send name and address to our publisher, and parcel shall be forwarded.
T. C. N.—Declined. We cannot undertake to return MSS.
K. R.—Too late for publication.
B.—Will receive a reply by letter.
EXHIBITION.—Already under consideration.
M. R. Z.—Yes; if suitable.
J. E.—Below our mark.
F. S. A.—We cannot say.
WILLIAM B.—In the hands of our engraver.
M. T.—Probably; but we do not like to promise.
A. B. A.—Has been declined more than once.
O. Q.—Send extracts for specification.
W. M. (Manchester), P. W. (Norwich).—Write to Spott, of Bucklersbury, London.

* * * All communications to be addressed to the Editor of *The Building News*, 20, Old Broad-street, Strand, W.C., except letters referring to advertisements or other business matters, which should be addressed to the Publisher, 18 to 21, Old Broad-street.
Advertisements are received up to six o'clock on Thursdays.

THE OFFICERS OF THE INSTITUTE.

THE period has just now arrived and passed at which the year of office of the council and officers of the Royal Institute of British Architects is concluded, and when they give an account of their stewardship to their constituency assembled at the "Annual General Meeting;" at which meeting also their vacated seats have to be filled either by the re-election of the old occupants, or by appointing new officers, as the case may be.

The annual election of officers has passed off this year without any of the excitement which last year attended the election of a President. Mr. Tite has been re-elected without any attempt at opposition on the part of those sections of the profession whose members were last year desirous of bringing in Mr. Beresford Hope. This compliment is one fairly due to the diligence and success with which Mr. Tite has conducted the affairs of the Institute during his presidency.

Of the Vice-Presidents, the two who retire are Mr. Digby Wyatt and Professor Donaldson, and they are succeeded by Mr. Owen Jones and Mr. Ashpitel, Mr. Scott being re-elected.

The honorary secretaries, it has been rumoured for some time past, proposed to retire, and this rumour received authentic confirmation a short time ago. Mr. T. H. Lewis and Mr. James Bell might have offered themselves for re-election as often as they pleased, and have been sure that their offer of continued service would have been promptly and gratefully accepted; but they have worked so well that no one can grudge them the relief of retiring from very arduous duties when they desire to do so. Mr. Lewis entered office upon the retirement of Mr. Digby Wyatt, in May, 1859, and has therefore been honorary secretary for three years. Mr. Bell has held office for two years only, he having succeeded Mr. Nelson, who, after long and laborious services rendered with great willingness, retired in 1860.

It is beyond doubt that the last three sessions of the Institute, the three since its removal to its present convenient house in Conduit Street, have been the most active and the most useful by far of its existence. The number of members has greatly increased, the attention of the Institute has been directed to questions of the greatest practical importance to its members; the average excellence of the papers read has been very great; the meetings, ordinary and special, have been numerous and well attended. All these things are proofs of the very efficient way in which the duties of the officers, and particularly of the honorary secretaries, have been performed, and will have also helped to render those duties arduous in the extreme.

We are only speaking the general feeling of the members when we say that the honorary secretaries who retire carry with them a very hearty appreciation of the value of their services, and the best thanks of all, without exception. They are to be succeeded by Mr. Seddon and Mr. C. F. Hayward, two members from whose known activity, energy, and skill the best expectations may be formed for the continued good performance of the duties of the secretariat.

It is no light task which the gentlemen whose names we have mentioned have successively undertaken, and it is really fortunate that hitherto members have been found who are eligible to the post, and willing to act. The honorary secretaries of the Institute must of necessity be men of considerable standing and experience; and yet at the same time an amount of work has to be got through which requires much exertion and time. But the class of men fit for the post being those who are usually immersed in business, to such an extent that their whole time and strength seem needed for the discharge of the duties they owe to their private clients, it has only been by great efforts, and a great sacrifice of personal comfort, that their public and private duties have been at all combined; and, as we have seen, the frequent changes which have of late taken place show that the post is one which men in practice do not feel it very possible to continue to hold for long together. There is little room to doubt that the same thing is likely to occur, with the gentlemen who have now assumed the position, as has occurred with their predecessors, and that some few years hence a fresh change will occur. This is in many ways undesirable, and suggests the thought that the time is approaching, if it be not come, for the election of a paid secretary in place of two honorary ones. Such societies as the Institute of Civil Engineers, the Society of Arts, in fact many others, find this course necessary, and have reaped great benefit from it; and it is impossible not to feel that the efficiency of the Institute, should the number of its members continue to increase as it has lately done, will only be permanently secured by the appointment of a well-selected and well-paid secretary.

There is one point to which it is to be hoped the Institute will turn its attention, and in regard of which less satisfactory progress has been made than might have been hoped. We refer to the education or assistance of students, and the steps to be taken to induce

them to study and to make use of the library of the Institute. We believe that it will not be found that the number of students is much larger than it was when the previous annual meeting was held—at which time there were only seven students—and, considering the large series of prizes offered for competition, we do not think that the drawings submitted have been of the class of merit which might have been fairly expected or so numerous as they ought to have been.

These medals, prizes, and other inducements are offered upon the supposition that there exists a large body of architectural students desirous of distinction and anxious to come forward for general competition. The results seem to show either that no such body exists, or else that, as a rule, the students are far less advanced than is to be wished or had been hoped. We believe there is some truth in both these statements.

The only body of young men known to us as undergoing systematic training, with a view to their entering the architectural profession, are Professor Donaldson's students at London University College. The students at King's College are not, usually speaking, destined for the practice of civil architecture. Those of the Royal Academy and of the Institute receive no special instruction, and in none of these cases is architectural drawing at all a part of the course. Drawing and elementary instruction are, we believe, given to a certain extent at South Kensington, but they do not go, so far as we are aware, to any great length.

Here, then, is the first essential to the creation of a body of students apparently wanting, namely, a complete college or other place of instruction. Much of this want may be supplied, and is supplied, by Professor Donaldson; but there is no course of drawing connected with his classes, and a large proportion of pupils and others do not attend them at all.

Nor does private instruction take the place of public or academic tuition. The gentlemen who take pupils are so circumstanced, for the most part, that they could not, if they would, do more than afford occasional and irregular superintendence, and give the young men an opportunity of seeing practice and sharing in the work of an office. Is it to be wondered at if this system produces results not altogether so satisfactory as could be wished? Pupils seldom attain skill in draughtsmanship, or great acquaintance with the fundamental principles of their profession, till they have pretty well concluded their articles, and, in fact, often do not begin to study or work at all till the time when they ought to be far advanced. Familiarity with office routine and a good deal of miscellaneous knowledge is often picked up half-unconsciously, and men so trained frequently come out at last successful and competent; but had the time lost in their early years been carefully employed, they would have been able to master many things which they must be content to leave unattempted or but half accomplished, or would have been thoroughly well-grounded instead of possessing little better than a smattering of knowledge.

This subject ought therefore to receive serious attention. The scheme of the voluntary examination, which has been for so long under consideration, will be a first step. It may only prove a corroboration of our idea, that the number of genuine architectural students is but small; but whether it only does this or succeeds in doing more, and brings to light an amount of talent and training which we had hardly believed to exist, it will be useful, and forming, as it will, an index by which to test the advance of education, it will be a valuable addition to our permanent institutions. It is, however, nothing more than a test and a somewhat doubtful stimulus. Something further is needed, and the Institute is the body which ought properly to furnish that something.

To return, from those who are to be, to those who now are members of the architectural profession, we regard it as a matter for sincere congratulation that the central society has met with so much prosperity and done so much work, and that its members and officers, notwithstanding great divergence of opinion, have been able to work together so harmoniously and in so friendly a spirit. There are some callings in which the proverb about "two of a trade" is believed to meet with constant illustration. This could hardly be said, even by Mr. Cole himself, of the fraternity of architects; and when we reflect how often the members of this profession are brought into competitive rivalry, and even called upon to oppose each other in legal causes, arbitrations, and settlements, it is no small compliment to the good feeling and honourable conduct of business habitual among them to say that in no profession is there a more generally diffused feeling of friendliness and cordiality than exists in the architectural profession. We trust that this may always remain so, and we firmly believe that if the transaction of public business and the diffusion of technical information be the ostensible objects of the Institute, its most important office is that of promoting personal friendship, and a general feeling of cooperation and mutual esteem, among its members.

THE ORDNANCE SURVEY.

IT is scarcely possible to over-estimate the value to the country of the labours, during the past ten years, of the staff of officers and men engaged in conducting the Ordnance Survey. With an amount of skill and talent which is worthy of the highest commendation, they have pursued the object they set out to accomplish, and their gigantic task has proceeded so far with complete success. Under the enlightened and scientific guidance of Sir Henry James, the Ordnance Surveyors have penetrated into every district of the United Kingdom, and the results of their assiduity appear in the form of a series of Maps, which for accuracy and minuteness of detail have not been equalled since the world began. Apart from the national feeling of pride which legitimately arises from the knowledge that we possess perfect delineations on paper of all the geographical and topographical peculiarities of the land in which we live—apart from that feeling of pride, there remains the satisfaction of knowing that those delineations are of great practical use. In all the operations of the Civil Engineer, for example, the Ordnance Maps are valuable, because they are reliable; and in the formation of railways they are of especial service. It is unfortunate that the action of Sir Henry James and his co-adjutors should have been impeded by the intermittent way in which money has been voted them by the House of Commons. A Select Committee of the House is now sitting in reference to the subject, and it may be trusted that hereafter the movements of the Surveyors will not be unnecessarily hampered. The Committee, indeed, although their labours are as yet unfinished, have given utterance to a rather strong opinion in favour of apportioning a constant sum of money annually towards the accomplishing of the National Survey. They state that "it is desirable that the Survey should be conducted as rapidly as possible, and that the sum voted for it should not vary in amount from year to year, as the frequent changes that have been made in the scales and the mode of conducting the Survey have led, according to the evidence of Sir Henry James, to the waste of £30,000 in the past ten years. That it has been stated in evidence by the Director of the Survey that an annual grant of £90,000 for twenty-one years would enable him to complete the North of England and Scotland and the Irish revision on the scales now in progress, and the South of England on the scale of 1860; and that he has further stated that the Survey might be completed in twelve years if the grant were increased to £150,000, thereby ultimately effecting a considerable saving."

It rests, of course, with the House of Commons to give effect to the views of the Committee, and now that the scale upon which the maps should be finally constructed has been determined, and the work is so far advanced, there seems to be no reasonable excuse for retarding the progress of the surveyors by withholding from them the proper funds. In consequence of the reduction of the vote last year by the sum of £20,000, no less than 180 surveyors and draughtsmen were discharged, and of the remaining number (1,357) 340 have been employed upon the survey in the South of England and Wales, required for the execution of works for the defence of our Naval arsenals, and for the purposed central Military Depot at Cannock Castle. This division of the surveying force has retarded the completion of the surveys of the counties of Northumberland and Cumberland, and it is likely that another year will elapse before that work is effected. We are very far from being advocates of a wanton expenditure of the public money, but in the Ordnance Survey we see a work which, as we have said, is of the highest practical value, and we therefore do not hesitate to recommend the House to give tangible effect to the opinion of its Select Committee.

A recent visit to the Ordnance Survey Office at Southampton, and an inspection of the whole of its internal arrangements, have convinced us that the means for carrying out the Survey are adequate and complete, and that they could scarcely be in better hands. The systematic way in which every department there is managed, and the judicious division of labour throughout, tend to make the establishment a complete and harmonious whole. The mixture of military and civilian artists and workmen observable in the leviathan work-rooms at Southampton does not interfere disadvantageously with the progress of the duties carried on there. On the contrary, it incites a degree of emulation which is of much value. The Ordnance Survey Department is singularly well placed as regards its sanitary condition,—just without the town, and on the old coach-road to London. It stands on an acclivity and covers a large area. The principal façade is handsome and of recent erection, and there is a noble court-yard in front of it, protected by iron railings and gates. In this principal building are placed the offices of Sir Henry James, Lieut.-Colonel Cameron, and others of the ruling officials. A flight of steps at the back conducts the visitor to a quadrangle, and surrounding this are the various drawing-offices and workshops; behind these again are the observatory, the photograph-rooms, and the standard bar house. So much interest attaches itself to the premises and operations constantly

going on in the Survey department, that we feel almost disposed to describe them. Possibly at some future time, indeed, we may do this, for it is a question if space could be more advantageously occupied. Few who see the finished Ordnance Maps are aware of the immense amount of care and skill which have been expended in their production.

At present it may be well to confine our further remarks principally to what has actually been accomplished and what is proposed this year to be done. Taking, in the first place, England, and the survey of it on the scale of 1860, it may be convenient to throw the details into tabular form:—

Locality.	Area in square miles.	Surveyed square miles.	Published square miles.
Durham . . .	1,097	1,097	1,097
Westmoreland . .	758	758	758
Northumberland . .	1,952	1,643	253
Cumberland . . .	1,565	1,211	39

The number of square miles surveyed on this scale during the year was 422, and the plans of 440 square miles have been published.

The counties which have been surveyed and published on the 6-inch scale *only*, are Lancashire and Yorkshire. The 6-inch maps are now engraved and published for:—

	Square miles.
Lancashire	1,905
Yorkshire	5,983
Durham	868
Total	8,756

The 1-inch scale—that is, one inch to the mile—has been most largely worked up to the present time; and consequently almost the entire map of England to that scale is complete. The area of England is set down, according to actual measurement, at 58,000 square miles. The area for which the hills have been completed is 53,234 square miles. The only portions incomplete are the parts of Northumberland and Cumberland, before alluded to, and where the survey languished from lack of funds. All the principal towns of the kingdom have been laid down to much larger scales; in some instances, indeed, to 12-foot scales. As regards military surveys made during the past twelve months, the principal are those about London, Chatham, Harwich, Dover, Coast of Sussex, Portsmouth, Isle of Wight, Torbay, Plymouth, and Pembroke, and these were made on the same system and scales as those adopted for the Ordnance Survey of the kingdom during the present financial year. Should the finances allow of it, the whole of these will probably be finished.

The area surveyed in Scotland during the year 1861 was 327 square miles for the 1860 scale plans, and 451 miles in the Highland districts. The number of square miles published is 528. Twelve counties of Scotland have been surveyed on the 1-inch scale, and the surveying of seven other counties is in progress. The area of Scotland is set down at 30,000 square miles, and as regards the 1-inch scale, the map is completed for 3,522 miles, whilst a much larger area is finished in outline. The progress in the hill engraving during the year 1861, was 657 square miles. The principal towns in Scotland were surveyed, and maps of them engraved and published on the large scale spoken of in reference to English towns. The publication of the plan of Glasgow, in 155 sheets, and of Dundee, in 59 sheets, was completed during 1861, as were those of Airdrie, Galashiels, Hamilton, Irvine, Jedburgh, Kilmarnock, Strathavon, and Rutherglen.

As touching Ireland, which it would be unjust to omit mentioning, although at the expense of protracting this paper beyond the limits we had assigned to it—as touching Ireland, every county has been engraved and published, "but in consequence," says Sir Henry James's Report, "of the instructions under which the Survey was commenced, the plans of the northern counties, which were the first surveyed, are without that amount of detail which has subsequently been found to be absolutely necessary for the local valuations and assessments, and hence it is that we are revising those northern counties at a great additional expense." Eight counties have been revised, and two others are undergoing the process of revision at present. As in the cases of England and Scotland, the large towns of Ireland have been revised on a larger scale, though not many of the maps of these have been as yet published.

The area of Ireland is equal to 32,813 square miles, and the whole has been drawn and engraved in outline on the 1-inch scale, although maps for 1,863 square miles only have as yet been published. During the year just past, 2,569 square miles were engraved in outline, and 434 miles completed with the physical features. In respect to the surveying campaign for the present year, it may be stated that the posts of command are thus distributed: Sir Henry James, Director; Lieut.-Colonel Cameron, executive officer in

charge of the General Correspondence, and the publication of the maps of Great Britain; Captain A. R. Clarke has charge of the Trigonometrical branch of the work, and of the initial levelling; Captain A. De C. Scott has charge of the zincographing of the manuscript plans, and of their reduction to the 6-inch, and 1-inch scales. In addition to these, there are divisional officers stationed in various parts of the United Kingdom, so that complete arrangements exist for carrying on the great and truly national work.

The sale of Ordnance Maps during the past year reached upwards of £8,000, and it does seem probable to us, that after the work of surveying is once accomplished, their sale, for they may then be reproduced at small cost, will be highly remunerative. If we have succeeded in throwing some little light upon the subject chosen for this article, it will for the present content us; but we must return to it ere long.

EXHIBITION GOSSIP.

THE days of admission to the International Exhibition by payment of a British crown are nearly over, and the commencement of the ensuing week will inaugurate a more numerous attendance of visitors than it has hitherto been the duty of the notorious turnstiles to register. It is probable that this change, while bringing more gists to the mill, will also add more grease to the wheels of the machines and cause them to keep better faith with the public. As the register now reads, the comparison of admissions to the '62 Exhibition with that of '51, is most unsatisfactory. The cause of this we are led to conjecture, and we venture to allege, arises from a combination of circumstances, some of them uncontrollable and others not so. Depressive trade has largely influenced the falling off of the number of visitors, shortness of time in the carrying out of the scheme has deterred many would-be exhibitors from occupying space and lending their aid and influence. The growing dissemination of complaints through the various organs of the Fourth Estate have, however, served to thwart the enthusiastic anticipations of the overweening Commissioners. Instances have been mentioned where exhibitors, who feel aggrieved, have possessed the power to materially influence a whole district in a manner anything but favourable to the Commissioners or their scheme.

The past week has been fruitful in the extreme in effecting final arrangements of the unfinished courts, particularly in the French, American, and Dutch departments; and judging from our latest inspection, we expect an early completion of the work yet remaining to be done. Stands are fast being occupied by male and female attendants, owing, we suppose, to the withdrawal of the stringent and arbitrary instructions given to the superintendents of classes. This act will be the means of imparting life and activity to the interior of the building in a far more appreciable manner than the irregular booming and clanging of bells. The Exhibition once having passed into the hands of the half-crown and shilling paying community, will shake off its hitherto marked cold reserve. We wish the *beau monde* would condescend to give up their Saturday visits in favour of the half-holiday industrial classes.

The Process Court strikes visitors with much that is ingenious and interesting. T. R. Pinches and Co.'s Exhibition Medal Press will be found at the southern end of the court adjoining the Pottery class, and is in constant action. This ponderous machine is the production of Messrs. Watt of Soho Works, and it yields a pressure of about 12 tons. Seemingly the dies meet with a lightness and grace that would scarcely squeeze a finger, but in reality they strike with the force above mentioned. Pure tin medals are struck off and sold at 6d. each. Copper ones, after repeated stamping and annealing, at 2s. 6d., and 3s. 6d. each. Silver medals in morocco case at 17s. 6d. These prices seem somewhat high, but in all cases where a heavy royalty has been exacted by the Commissioners, as in the case of refreshments, &c., the public will find that heavy prices are essential if the speculators are to turn an honest penny. We hear of £2000 being the sum paid for the privilege of producing and selling these *souvenirs* of the building. The process of medal-making will be pleasing to thousands of persons, and more so from the fact that the exhibitors allow a portion of the manipulation to be performed by the purchasers. Two stalwart able-bodied artisans, on a raised platform, swing the horizontal beam of the screw until a few threads have been run down and the metals meet, which is a period of a few seconds. The design of the medal may be characterised as a happy one in one respect, as it gives Captain Fowke the credit of having erected a building with a central dome, which virtually and unfortunately is not the case. True, there is a qualification in the description in the words "West front," but that is no reason for striving to conceal or falsify the actual fact of the building having two far distant domes. The other side of the medal represents peace and welcome being offered to all nations by two emblematic figures seated, holding flags and an olive wreath, and surrounded by objects of art, science, and industry.

In juxtaposition to this process illustration is that of a silk velvet loom in action. Here, at intervals, may be seen the raw material woven deftly, tightly, and regularly into piece velvet. A happy contrivance we noticed is the use of double shuttles and bobbins, and brass rods whereon to strain the threads as the work proceeds. These rods or, more correctly speaking, fine wires, afford the necessary means for severing the threads to produce the softness peculiar to velvet, and at the same time the wires are alternately extricated without slipping threads. The weaver in charge manifests considerable dexterity. The machine is neatly contrived, and seems free from complexity.

Passing onwards, we reach Simpson's sewing machine, from Cheap-side, possessing, we suppose, the requisites of a useful machine; but as the competition in these articles is very keen just now, a more detailed observance must be deferred till another visit. The paper-collar embossing machine, on the left, excites much interest. Specimens of collars, cuffs, wristbands, &c. are exhibited, and are really of such good workmanship as to vie with similar articles of a more costly material. We perceive that agents are wanted for the sale of these articles, which are nominal in price, and eminently serviceable. The only process exhibited is embossing—the paper outlines being the work of steam power apart from the building. A namesake, and we believe relative, of the present Post Office Secretary, exhibits a new letter-stamping machine, but it was not going when we inspected it. Mr. Reynolds exhibits his process of making pipes complete from the clay. The stand is a few yards distant on the right of the medal press. The arrangement and details of the process are creditable to the exhibitor, and worthy of the space assigned to it. A highly interesting feature (specially removed from Class 10) in this department, and one which will, we are sure, be well patronised, is a plate-glass pyramidal stand of patent moulded carbon filters by Messrs. Atkins & Son, Engineers, of 62 Fleet Street. Blended with the stand is a novel description of fountain, such as is exhibited at their city depot. It is constructed of glass tubes, through which purified air and water circulate. At the base of this stand issue six outlet pipes, from which flows filtered water for the use of visitors to the building. Filters and fountains arranged in the shape of a "trophy," must suffice as our notice of this stand for the present. This stand, placed in the nave, would, we predict, have escaped the censure of Mr. Cole, and been a pattern to the Exhibitors, who have been suffered to build huge unsightly erections. We shall return to this stand and its utility, when considering the class to which it legitimately belongs.

We must now regret the absence of more materials to work upon in the Process Court, if it contains nothing more than what we saw. Where are the fancy glass-blowers and the funny button-makers, whose expeditious manipulations are always a source of pleasure to the curious sight-seers?

Our presence in this Court naturally led us to scrutinise rather closely a recent importation from the great nave—we mean the condemned portion of Mr. Cremer's toy "trophy." True his "trophy" was not worthy of its first position, but notwithstanding the sweeping sarcasm which has been heaped upon it, we must not forget that the worth of toys in educating the young is considerable, and that toy-making is the means of employing whole communities of workpeople. The fragments of the "trophy" are here displayed with a considerable degree of taste. To render it effective, the background—the wall—should be of a contrasting colour; as it is now, wall and objects have no diversity as regards colour. Might not a few pounds have been spent in plastering the walls and colouring them properly with neutral tints? The large sums of money which have been expended in producing satisfactory hangings for backgrounds by the Americans and others, might very justly be debited to the Commissioners, *exchequer*.

The redeeming features of the past week's programme of procedure have been the intended early issue of shilling tickets, the re-formation of the objects in the nave, the introduction of musical instruments, and the improved entrance to the eastern annexe, all of which were the results of suggestions pointed out by the public press. We trust that the suggestions of "the gentlemen of the press" will throughout be treated with the same respect, as deference to popular criticism will much affect the success of the whole enterprise.

METROPOLITAN BOARD OF WORKS.—At a meeting of the Metropolitan Board of Works, to be held this day (Friday), the following recommendations from the Main Drainage Committee will be taken into consideration:—"That during the absence of the Chairman of the Board (owing to ill-health) a chairman be elected on every Friday, or other board day, from the members present at the meeting of the Board." "That each committee be directed to select, at their next meeting, from their number a chairman and vice-chairman, who shall so act, during the pleasure of the committee." "That during the absence of the chairman, Wm. Hy. Dalton, Esq., be authorised to countersign cheques in lieu of the chairman, and be requested to attend on the occasion of every payment made at the office, for the purpose of handing over the cheque to the party entitled to receive the same; and that, with this exception, the present regulations with respect to the drawing of cheques and mode of payment be continued." "That during the absence of the chairman, the clerk of the Board do countersign the documents signifying the approval of the Board to applications for special buildings under the Metropolitan Building Act, for the formation of streets, &c."

MEMORIAL OF THE LATE PRINCE CONSORT AT BALMORAL.—The *Aberdeen Herald* says, at a meeting of the tenants on the royal estates, held at Abergeeldie lately, it was finally resolved to erect a granite obelisk as a monument to the late Prince Consort. The place of erection was left to the decision of the Queen; and she has, we understand, decided upon a little wooded "knowe" to the south-west of the castle, and near the road. Various designs for the monument were submitted for the approval of her Majesty—the one she has chosen being, we believe, by Mr. Becton, resident at Balmoral; and as it has already been contracted for, the work will be proceeded with immediately.

A NEW PLAN FOR BUILDING BRIDGES.

MR. SEDLEY, of 210 Oxford Street, has just protected by letters patent a new plan for building bridges in wood and iron of large spans. We have seen a model of the bridge, and consider it well worthy of the consideration of architects, builders, and mechanical engineers.

Models of the bridge on a scale of 60 ft. to 1 ft., and 28 ft. long, and weighing 24 lbs., may be seen at the International Exhibition, Museum of Patents, South Kensington, and the Architects' Museum, Conduit Street. Engineers and architects will be allowed to test them without reserve, having first agreed upon the weights such structures ought to bear.

The inventor claims in his patent for a bridge which can be constructed of wood or iron, or wood and iron and steel combined. One of the new features of this bridge is that the suspension forms a part of the tubular construction, and is entirely independent of the piers or abutments, and forms no part of them, and so differs entirely from any bridge that has hitherto been built or attempted. On other points there is also a marked difference. The inventor proposes to build his bridge on shore on a suitable tram or railway, and when completed and fairly tested, to launch it out as far as desirable over the abutment, always reserving on shore a sufficient part or portion to counterbalance fully the part projected out. In bridges up to 500 ft. span, the inventor proposes to build the bridge entirely on one side of the river or valley intended to be crossed, and then to launch it out over the river or valley till the projected end is received on the abutment on the other side or shore of the said river, &c. But when the spans exceed 500 ft., he proposes to build one half of the bridge on each shore, and, when completed, both are run out intermediate of the width of the river and united in the centre by means of the shoe S shown in the sketch. The centre is also further strengthened by the application of arched flanged girders, which are made of great strength, consistent with lightness, and for this purpose it is proposed to use steel, or iron and steel combined. Great economy and simplicity are claimed for this method of construction, as no subaqueous piers or works are necessary, and single spans up to 1,500 ft. in width can be constructed at any height without risk or difficulty, as the work may be tested daily whilst in progress. In the diagram shown of the bridge it will be seen that it is composed of a series of long rectangular girders piled on each other, varying in size and thickness according to their distance from the centre of the bridge. The roadway is suspended by means of bars passing through the centre of these girders. The suspension bars or plates H perform only a limited office in the place of the usual catenary curve.

Sections of the girders over the piers are shown at A B, of the in-shore end at C D, and of the middle E F. It is quite evident that in this method a bridge of single width may serve a double purpose and be useful for ordinary and railway traffic.

ECONOMIC MUSEUMS.

MR. THOMAS TWINING of Twickenham has recently done "the State some service" by calling into existence an Economic Museum, which deserves the attention of the universal public.

That gentleman, says a contemporary, in 1857, addressed a communication to the Chairman of the Council of the Society of Arts, in which the following passages occur:—"The experience acquired since 1847, as a member of the Managing Committee of the Labourers' Friend Society, has led me to a conviction that much of the privation, discomfort, and ill-health to which the working-classes are subject in this and other countries, and many of the errors and failures of the friends of the poor in their benevolent endeavours, might be avoided by a more general diffusion of that kind of practical knowledge, in matters of domestic and sanitary economy, which may be termed the science of common life. I perceived, at the same time, that the only way to make that knowledge popular was to offer it in an easy, familiar, and attractive form; and thus I was naturally led to the plan of establishing exhibitions and permanent museums of domestic economy."

Mr. Twining had, in fact, been quietly working out this theory since the year 1850. In 1855 it was fully developed in a memorandum addressed by him to Lord Elbrington. Copies of this memorandum were printed, and extensively distributed throughout Great Britain and the Colonies. It was an able document upon the subject of which it treated, and we may judge its general character from the following extract:—"Manufacturers, tradesmen, and mechanics work their inventive abilities (as a rule) in a business-like manner. Men of science, more especially so-called, have not yet, generally speaking, attained to such a standing in this country as to be able to lay aside the thoughts of themselves and their families. Even amateurs, though their position may raise them above pecuniary considerations, are seldom above the temptation of bringing out that which may be conspicuous, in preference to that which may be useful. In short, the homage of knowledge and ingenuity is very naturally paid to those who can best give an acceptable return; and whilst every appliance of science and art is

called into requisition to meet the fastidious fancies of the rich, and to supply novelties for the cravings of fashion, the requirements of the humbler classes are comparatively overlooked."

The writer evidently saw one of the great causes of the destitution and criminality which disfigure the annals of our own, and other countries, and he determined also to point out the remedy, and, if possible, employ it. The publication of the memorandum and the persevering industry of its framer were soon responded to and rewarded. Economic Exhibitions of a temporary kind were inaugurated at Paris in 1855, at Brussels in 1856, and at Vienna in 1857. These were all successful in a very high degree. At the South Kensington Museum, too, Mr. Twining succeeded in getting a section appropriated to the purpose he had in view. This was called "The Department of Domestic Economy, comprising Illustrations of Every-day Life for the Working-classes;" and of its nature and usefulness it is unnecessary for us here to speak.

Encouraged by the success of the embryo collection at South Kensington, which had been formed there permissively and experimentally, Mr. Twining removed the exhibition to the Polytechnic Institution, and has now finally removed it to Perryn House, near the railway station, Twickenham, for convenience and more complete development. It is, in fact, as the example for a grand Metropolitan Economic Museum, and for branch museums throughout the country, that the founder of the present institution at Twickenham desires that institution to be regarded. He is, indeed, of opinion that Economic collections should be established on all hands, whose object would be to impart to all classes, and especially to those whose income is small, the "knowledge of common things, or science of every-day life." He would have them show, for instance, what sort of dwellings they should live in to secure health and comfort, and what improvements in household management may be derived from the discoveries of science, or from other sources. In short, he would have the Economic Museum teach the working-classes how to live with judgement, and get the best money's worth for their money.

It would be difficult to conceive more praiseworthy objects than those sketched out by Mr. Twining, and it is satisfactory to know that they are not the visions of a philanthropic dreamer, but the aims of a sterling, steadfast, and determined man.

In the establishment of the Economic Museum at Perryn House, we can see an earnest of future and permanent good to the working classes of this country. It is an exemplification of what the will and energy of one man may accomplish, when the will and energy are governed by right principles and guided to practical ends. We do not despair, indeed, of seeing "London with its Economic Museum on the fullest scale, provincial towns with appointed collectors, Mechanics' Institutions, with rooms allotted to the illustrations of common life, Lecturers supplied with portable Economic Collections and Educational Establishments, down to Village Schools with their Economiums or Cabinets of Useful Objects." When this state of things shall have arisen—and it is no utopia that we are picturing—how much of misery, how much of degradation, and how much of *crime*, will be in a fair way of being banished for ever from among us? The barriers between classes which selfishness has created, and which ignorance maintains, will be thrown down, and that sympathy, of which the good Judge Talfourd spoke, and which, with his dying breath he invoked, will disseminate its divine influence on all around. The great merits of Mr. Twining's scheme of popular education, are its practicability and freedom from any shade of sectarianism. Its advantages will not and cannot be confined to any one class, sect, denomination, or sex, but to the humbler portion of the community, irrespective of all distinctions, the good resulting from its realisation must be considerable.

Amid the din and clatter about iron ships, rifled guns, submerged vessels, projectiles, targets, and fortifications, it is pleasant to turn aside for an instant and look approvingly upon the efforts which are being made for the amelioration of the troubles, difficulties, and cares which beset those whose "lot it is to labour."

The Perryn House Economic Model Museum is divided into nine classes, as follows:—

- Class I.—Building Designs.
- Class II.—Building Materials.
- Class III.—Furniture.
- Class IV.—Clothing.
- Class V.—Food, Fuel, and other Household Stores.
- Class VI.—Health.
- Class VII.—Home Education, Self-Instruction, Recreation.
- Class VIII.—Miscellaneous.
- Class IX.—The Library.

The Museum is open to the public only on Wednesdays and Saturdays from 2 to 5 p.m., on the presentation of tickets of admission, which may be obtained from Mr. Twining, or at the Society of Arts, Adelphi, London. The founder of the Museum is entitled to expect cooperation, and we cordially invoke its aid in so good a cause. The Library as it exists at present is admirable, but its extension by donations of eligible books is a thing to be desired.

PUBLIC MONUMENTS.

THE last number of the *Edinburgh Review* contains an admirable article on public monuments. After the reader has perused the following extract, probably he will refresh himself still further by reading the article itself.

"Amongst the numerous monuments which have been raised in our time, two of the best are the monument to Sir Walter Scott in Prince's Street, and the monument to Pascal placed under the elegant and graceful tower of St. Jacques, in Paris. Doubtless, these works derive an additional charm from the associations they awaken. Scott, enthroned in his magic chair, surveys 'his own romantic town,' and many of the scenes to which his muse has given an imperishable interest, whilst the Gothic structure above him is itself consecrated by his genius. Pascal stands beneath the tower, from the top of which he made his own experiments on the pendulum, and which has now, in the mutations of French society and architecture, become the monument of his fame. These may be exceptional instances; but they serve to show what pleasing results are to be obtained by a judicious combination of sculpture and architecture, where each would be dull and lifeless without the other. They are examples, too, of statues placed in or under open buildings, an expedient which protects them from the direct action of the weather, whilst it serves to exhibit them in the most favourable light.

"To speak of single statues or monuments on a smaller scale, although that is not the subject to which we designed principally to direct these remarks, it is evident that the nation greatly needs a suitable repository for such memorials. Nothing but the want of such a repository could have induced the Deans and Chapters of the metropolitan cathedrals to turn those edifices into museums of sculpture, peopled with the effigies of departed greatness. The great Abbey and the Dome of St. Paul's are hallowed by the remains of the illustrious dead who rest within those walls, and the monuments raised there, when they are of a sepulchral character, are strictly in place. The proposal to make the monument to the Duke of Wellington a mortuary chapel in St. Paul's is perfectly appropriate, if we may dare to hope that the execution will answer to the conception. Westminster Abbey contains no less than sixty-two recumbent statues of life-size, some of which—such as the statue of Queen Eleanor—are of extreme beauty; the tombs of Henry VII. and his queen, by Torrigiano, are fine works in bronze; and the recumbent monuments of Elizabeth and Mary Queen of Scots, supposed to be by Nathaniel Stone, are characteristic and interesting. But we view with different eyes the forty-six portrait statues, life-size or colossal, and ninety-three busts or medallion portraits, which have been crowded into this sacred edifice. To erect a statue of a great man in a church, simply because other great men are buried there, is an offence against good taste and good feeling. The statue of the late Sir Robert Peel, by Gibson, in Westminster Abbey is a complete example of everything that is most objectionable; and, with the strongest desire to do honour to that eminent statesman, we wish that his figure were in any other place and in any other costume. As far as Westminster Abbey is concerned, the question is solved to a great degree by the want of space for more monuments; but from the venerable and delightful associations connected with that spot, it is much to be desired that some fitting extension should be given to the monuments in the precincts of the Abbey, by executing the restoration of the Chapter House, proposed by Mr. Scott some years ago, or by converting the cloisters into what they strictly ought to be—the Campo Santo of the Royal Minster of England.

"One of the finest parts of Barry's conception for the Houses of Parliament, is the skilful conversion of Westminster Hall, the most time-honoured and august edifice in this realm, into the approach to the Chambers of the Legislature. We see no reason that this great Hall should not be adorned by a certain number of statues of illustrious statesmen—indeed, we think that there is no other place so fit for them. The light, which is now defective, might easily be improved by introducing plate glass into the lower tier of windows, and the effect of the Hall, so decorated, would be one of the grandest things in Europe.

"A very large proportion of the monuments which now decorate the capitals and great cities of Europe are of recent execution; and probably there has been no period since the Roman Empire in which so many statues have been erected as in the last fifty years. But the same feeling has everywhere invoked some form of art, however rude, and seeks to attach the perishable record of frail humanity to some monument of indestructible permanence or of commanding beauty. The stones raised by the Patriarch on spots hallowed by revelations from heaven; the nameless tumulus which looks out on the Northern Ocean: the Pyramids, in whose sepulchral recesses modern science has read the names of forgotten kings; the granite obelisk, whose shadow has marked day by day the passage of three thousand years, like a needle on the dial plate of time; the dome-shaped tower which covers the relic-shrine of Anuradhapura, or the prodigious Minaret of Victory which towers above the ruins of Old Delhi; the sculptured forms of Greece, which art made the counterfeit of life, and superstition the object of idolatry, until the pagan world was peopled with a race of ideal beings, exalted by the imagination of the people and the artifices of the priesthood to the rank of gods; the stripped oak, on whose shattered branches the warrior hung the trophy of his captive's arms; the arch through which the victorious Imperator led his triumph to the Capitol; the lone column which he encircled with his Dacian conquests—were all different modes of setting up some beacon above the waters of oblivion—were all attempts to associate some permanent material object with the fame and love clinging to a human life. The pious veneration of the

Middle Ages for the memory of the great and the brave took the form of elaborate tombs,—the fit resting-place of a Christian knight, surrounded by the heavenly patrons of his faith and the emblems of his salvation. In Italy the splendour of the arts almost eclipsed their application to the memory of the dead, and the marvellous Chapel of the Medici is the monument not so much of Lorenzo and Julian as of Michael Angelo. From this stage the transition was rapid to courtly adulation and allegorical imagery. A monument loses its real importance by as much as it departs from simplicity, reality, and truth. It is easy to trace in any long series of monuments, erected under similar circumstances, such as the Papal tombs in St. Peter's, the progress or decline of correct taste in the centuries which have succeeded the erection of the edifice in which they stand.

"The inventory of the public statues of London is not a creditable one. We have fifteen kings and queens, namely, the grand statue of Richard Cœur de Lion in Old Palace Yard, Elizabeth, formerly at Ludgate, now in front of St. Dunstan's, Charles I., Charles II. (supposed to be the statue in Soho Square), James II., the fine work by Gibbons behind Whitehall, William III. in St. James's Square, three Queen Annes, two figures of George I., one of George II., two of George III., the colossal statue of George IV. in Trafalgar Square, and William IV.—a coarse statue in the approach to London Bridge; the Dukes of Cumberland (the butcher), Kent, and York; three Wellington statues, Nelson, Napier, and Hawke; Francis, Duke of Bedford, Fox, Pitt, Canning, Peel, and Lord George Bentinck; Major Cartwright, Sir Hans Sloane, and Dr. Jenner. Statues of Stephenson, Brunel, and Lord Herbert are in preparation. The list is a lamentable one; it contains not one of the first names which have dignified English literature or philosophy; and it shows that these statues have for the most part been raised by courtly sycophancy or party enthusiasm—not by the deliberate veneration of the nation for its greatest benefactors. The present mania for 'testimonials' tends to multiply this evil, and to raise statues to men whose very names will be forgotten in another century. We have sometimes thought that it would be well if these modern candidates for posthumous fame were subjected to the same test which the Court of Rome applies to the beatification of its saints, and that no one should be added to the calendar of heroes and sages until half a century has passed over his tomb. Contemporary monuments are apt to partake too much of the zeal of adulation or the poignancy of personal regret. In some cases, indeed, time and the justice of posterity have supplied what was neglected at the moment of death. Thus the county of Salop has recently raised a forcible and dignified statue of Lord Clive; and the town of Grantham now boasts a statue of Newton, which was inaugurated in September, 1858, by Lord Brougham, who pronounced one of his most finished oratorical compositions on that occasion. Well might he exclaim, that it was a just subject of astonishment that to so renowned a benefactor of the world, exalted to the loftiest place by the common consent of all men, no public monument should have been raised in his own time, or for a century and a half after his death. The statues of Newton in the ante-chapel of Trinity, Cambridge, and in Westminster Abbey, are appropriate memorials of him in the College he adorned and over the grave where he lies. But the genius of Newton ranks him with the powers of the first order. It may be said of him with greater truth than of the philosophers of old, that the universe itself is the monument of his fame; but it is a reproach to the nation that no means should have been found to place more conspicuously before the eyes of future generations that dignified form, that serene and speculative countenance, which so nobly distinguish the first of England's philosophers."

ELVETHAM HALL, HANTS.—The works at this place (the seat of Lord Cathorpe) are rapidly approaching completion, and when finished will greatly enhance the reputation of the architect, Mr. T. S. Teulon. The exterior has been nearly rebuilt, and presents a most imposing general appearance. The interior work and decorations (by Harland and Fisher of London) are in capital taste, and on a most liberal scale. The walls of the great hall are covered by an inlaid species of fresco painting, in a diaper pattern, as far as the corbels supporting the timbers of the ceiling; from thence to the ceiling a continuous frieze, of brilliantly coloured shields, is arranged in genealogical series. The ceiling itself is in fresco, in an ornamental design of flowers and foliage, further enriched by subjects from the death of King Arthur in the centre, and, in medallions round these, by portraits of his queen and knights, in flat tints. The walls of the corridor leading from the hall to the grand staircase are treated like those of the hall itself. The ceiling is painted in a geometrical arrangement of bright colours, and the staircase ceiling is decorated by a richly gilt central Sun, round which are arranged, in medallions, the signs of the Zodiac, the Four Seasons, and Day and Night, all in fresco. The library has upon its ceiling authentic portraits of the statesmen and men of letters of the time of Queen Elizabeth, surrounded by foliage and ornaments characteristic of the period. The ceiling of the drawing-room is divided by timbers into various geometrical forms; the panels thus created being filled with an ornament of brilliant colours, with, in the centre of each, a head of one of the characters in Sir Walter Scott's "Kenilworth," upon a gold ground. The ceiling of the dining-room is in panels, which (upon a delicate blue ground) are entirely covered by interlacing branches of various fruits, amongst which the fig, vine, orange, and peach, are conspicuous, painted from nature, the intervening timbers being partially gilded and painted in various patterns. The effect of the whole is very refreshing, and the general ceiling treatment throughout the entire building renders this an important example of that application of art.

LONDON ROADS AND RAILWAYS.

AS if to make amends for a long state of apathy, the employés of the Board of Works are pushing on their operations in regard to the formation of the new street from Blackman Street, Borough, to Blackfriars' Road, with great vigour. At the Borough end of the new thoroughfare the results of their recent labours are especially apparent. For a considerable distance the pavements are completed, and the paving of them with granite is in a fair way of being so. The value of this street when finished and opened will be great. The difficulty of reaching London Bridge from Stamford Street, Blackfriars' Road, except to the initiated, has hitherto been immense, especially as respects vehicular conveyance. There was nothing for it but to go up the road to Union Street, a sufficiently narrow line of communication, and through it, if found possible; or else to take Holland Street, and then tempt the "dark perplexed ways" of Bankside. The new street passes through hallowed ground, as some would term it, for the supposed site of the theatre where Shakespeare played in his own eternal dramas is in the line it takes. The site of the Bear Gardens, too,—to step at once from the sublime to the *barbarous*,—of three hundred years ago, will be covered by the rapidly advancing thoroughfare.

In close proximity are the works of the London, Chatham, and Dover Railway; and these are progressing with satisfactory spirit. The line will pass very close to the venerable and picturesque church of St. Saviour's, the appearance of which was not improved by the formation of the approaches to New London Bridge.

Apropos of the Chatham and Dover Railway, it is to be lamented that the City Authorities can come to no conclusion as to the kind of structure which shall supersede the rickety, dilapidated, and dangerous bridge of Blackfriars. Their hesitation on this point is a serious misfortune for the London, Chatham, and Dover Company, and retards their movements to a considerable extent. It seems to us that the proper solution of the question lies in the construction of a bridge of sufficient width and stability to sustain both the ordinary and the railway traffic. One or two plans for such a construction were submitted, we believe, to the Bridge Committee, but, so far, without inducing their concurrence. It would be difficult to conceive anything more incongruous or inharmonious than would be two bridges of a totally different character as regards architectural arrangement, spanning the Thames within a few feet of each other; and we hope that the people of London will be spared so humiliating an exhibition.

What with lines of railway in process of formation, the throwing of not particularly handsome bridges across the principal streets and roads, and the bustle contingent upon the anticipatory demolition of dwelling-houses, the Boroughs of Southwark and Lambeth are in a constant state of confusion. The landmarks of the "oldest inhabitants" are disappearing at the shrill summons of the coming locomotive; and the words of the poet,

"The presence of perpetual change is ever on the earth,"

are receiving literal illustration at the hands of the work-people of the two boroughs. Out of that chaos order will eventually arise, no doubt; and in the moral certainty that all the changes thus made will "work together for good," must be found consolation for the inconvenience arising from their procedure.

AUSTRALIAN ITEMS.

WE have not heard as yet that the accepted design for the new Houses of Parliament, proposed to be erected in Sydney, has been brought into practical requisition. Additions, however, have been commenced recently to the Sydney University buildings. The first portions of the design of these were completed externally three years ago—with the exception of the turrets on the tower. The works now undertaken will give an aspect of completeness to this part of the edifice. The shape of each of the turrets, which will be four in number, will be octagonal; the projecting mullions will support a mitre-shaped cupola, the successive ridges upon which are to be ornamented with rows of crockets, and above all will be a gilt spire. Between the turrets on each side of the tower, there is to be made a tasteful combination of crockets and finials, surrounding a clock face. A clock for one of these has been presented to the University by Sir Stuart A. Donaldson, and it is intended to supply the requisite gearing for each of the four faces to show the time. The contract for the masonry of the turrets has been taken by the Messrs. Loveridge for £1,247, and that for the carving by B. W. Hinton, for £300; the work to be completed in six months. The total sum voted by the Legislature for going on with the buildings was £5,000. The balance of this amount will be expended in flooring, plastering, and the internal fittings generally of the entire structure. The work will be highly creditable to the colonial architects, as it will in its entirety be permanently valuable to the rising generation of colonists. The very best proof of the prosperity and enlightenment of our colonial fellow-subjects is to be derived from their establishing such glorious institutions as the Sydney University.

The new Australian Museum facing Hydo Park, in the same city, has been commenced, and is in fact progressing rapidly. The foundations are in, and the walls of the north-eastern corner are above the race-course.

On the 17th of March, a meeting was held in Sydney for the purpose of devising means for completing the building of St. Andrew's Cathedral. The Governor of New South Wales presided on the occasion, and much sympathy with the object of the meeting was displayed by the numerous and influential auditory. The foundation-stone of the edifice was laid five-and-twenty years ago, and the annual expenditure since has amounted to £1,000.

Eventually it was determined by resolution to raise subscriptions for the carrying on of the work to completion. The fact is, that the colony twenty-five years since was much too young and not sufficiently wealthy to undertake with much prospect of success the erection of so ambitious and extensive a structure as St. Andrew's Cathedral. It cannot be said that the brick-work and masonry composing so much of it as is finished has been too rapidly executed. It is not "green" work, unless that kind of greenness which sometimes arises on buildings from dampness and neglect may make it so.

FIRE-PROOF STOREHOUSES.

Sir,—At a time when sundry minds are much disturbed respecting the storing of petroleum and other combustibles in large quantities, I desire to offer a few non-professional suggestions regarding the erection of Fire-proof Storehouses, for the consideration of professional persons.

1st. I propose that, where a plurality of warehouses are to be erected, they should be built, say 4 ft. apart, not to external appearance, but the space subdivided into a nest of flues, giving to each floor its distinct flue, and that the walls of such flues be carried not less than 12 ft. above the roof. These flues, in the event of fire, would not greatly encourage combustion, if at all, so long as the windows and doors were closed, while they would provide a safe outlet for smoke and flame, which would give immediate notice of the existence and locality of the fire, at the same time admitting the possibility of entering such floor without fear of suffocation, as the opening of the door would drive the smoke and flame with greater force toward the flue.

2nd. That as all existing floors, whether pugg'd or of brick, become red hot under a given degree of heat, I propose to substitute for them iron tank-floors; that is to say, to adopt a similar arrangement of girders as for carrying a brick floor, but to convert each space from one main girder to another into a watertight compartment, having all the cross girders so perforated as to admit of the free flowing of water; the depth of each floor-tank to be determined by the depth of girder required, the lower face forming the ceiling of one floor, and the upper the floor of the next. This kind of floor (so long as the flow of water was not interrupted) would admit of bracing to any extent, and would be much stronger than any other.

3rd. I would substitute for the present form of stanchion tubular columns, connecting the base of each with the floor-tank by a short tube or otherwise, and also perforate each near the cap, so that in the event of fire each would be converted into a steam-pipe; but as it is obvious in a case of fire that steam might generate rapidly, it would be matter for consideration how far the steam so emitted might be available in extinguishing the flames, or whether each set of columns should be provided with a tube to convey it outside; or, again, whether the existence of the flue would be a sufficient safeguard.

4th. That the loophole-frames should be of iron, and so constructed as to be capable of containing water, having a tube at the top connected with the roof, which I suggest should be a tank, not exceeding 3 feet in depth, and covering the entire building, less so much of it as might be required for light.

5th. That each window should be provided with a double-skinned iron shutter, fixed on the sliding principle, working in a groove upon the bottom of the floor-tank, having the bottom part open and the top closed so as to allow the steam to fill the vacuum and pass out of a perforation near the top of the inner face, also having the middle part of the bottom shorter to allow of the water flowing under.

6th. That the same principle be observed with the loop and communicating doors.

7th. That the roofs of the buildings should be accessible externally. This might be by iron steps built in the walls after the plan of the sewer manholes or otherwise.

8th. That the building be provided with service-pipes having an outflow into each section of the floor built in the walls parallel with each floor-tank, having each a perpendicular feed-pipe with its orifice in the bottom of the roof-tanks furnished simply with a wooden plug. Two perforations of 4 inches diameter through each main girder would prevent one section of the floor being charged before the other, and a simple arrangement, familiar to all engineers, would prevent the floors being overcharged either with steam or water.

9th. That where a plurality of buildings are to be erected, the same height should be observed, and each roof-tank connected, which, in such a case as Cotton's Wharf, would give a sufficient supply of water for any ordinary emergency, independent of all extraneous aid.

10th. That the roof-tanks be kept constantly charged, and allowed to flow slowly to prevent stagnation.

11th. That a hose be provided for internal use on each floor, connected with roof-tank.

12th. In the event of fire, it would be obviously possible to charge the tank-floors above and below, reserving the entire force of water to swamp the burning goods, an operation that might be performed before the arrival of any extraneous aid.

Such is the plan I propose, and, should it be considered to possess any merits, I leave both it and myself in the hands of the public to deal with both as we may be thought worthy.

JNO. C. PORTER, 65, White Horse Street, Stepney.

WATER-COLOUR EXHIBITION.

5 Pall-Mall East.

THE present collection does not display any extraordinary advance either in execution or choice of subject from that of last year. The only change of importance is the addition of three new members, namely, Messrs. A. W. Hunt, J. W. Whittaker, and H. B. Willis. The last-named artist has been chiefly engaged on pictures in oil, but he now appears as a most accomplished painter in water colours. "A Meadow Scene in Sussex" is remarkably finished, but at the same time the general effect of nature is well preserved. "Evening" from the same pencil, will be admired for the flatness of the distant country, the admirable style in which the animals

are painted, and the great variety of treatment. Several other scenes of a similar kind, being equally well painted, establish this artist as a valuable acquisition to the society. Of a very high order of merit are the four contributions by Mr. J. W. Whittaker. "Llyn Heli" is a fair example of the rest, for it is classically treated, well composed, and chastely coloured; and the five drawings exhibited by Mr. Alfred Hunt, the other new member, are graceful in feeling, with a tendency to minute pencilling, something in the style of Birket Foster, particularly the drawing with a pleasing twilight effect, entitled "Oberwessel." Having disposed of the new contributors, we will turn our attention briefly to the veterans of the society.

Mr. Branwhite is less theatrical this year, and his landscapes gain by the change. "The River Dee, North Wales," retains all his usual clearness of effect without exaggeration. "The Morning Blessing," by Mr. Rivière, is pretty, and would be perfect if the face were not too powerfully portrayed for the rest of the subject. Mr. Taylor continues to paint his dogs and huntsmen in his old broad manner, without having increased the correctness of his forms; but we think the drawing (No. 7) is appropriately called "Repose," as the arrangement is suggestive of that sentiment. Mr. Davidson is, as usual, a numerous contributor. "Looking up the Dollywddelan Valley, North Wales," is clever; "At Reigate—Early Spring" has much careful detail, and at a proper distance presents the true aspect of nature. "Late in the Autumn—Windsor Park" is in the same style, and "On the Flugwy, North Wales," has a waterfall very effectively represented. There are several excellent drawings by Harding, and we think the best of them is the "Pass of Inversnaid, Scotland.—Deer Stalking." Mr. W. C. Smith's view at "Vicenza, Lombardy," which is generally elegant in treatment, would be improved if the harsh and angular outline of the distant mountain were softened; but there is much vigorous pencilling in the "Bed of the Llyn, Llynmouth." Some of the productions by Mr. John Callow, like his study "On the Margate Sands," are elegant, and not so conventional as formerly. "Beating up the Frith of Forth" has besides a freshness of atmosphere very suitable to the subject. Mr. Gilbert pursues his reckless and bravura style of execution in "Rhine Wine," a party of Germans indulging rather plentifully in that beverage, but in "Don Quixote at Home," arguing which was the better Knight, Palmerin of England or Amadis de Gaul, with the barber-surgeon of the town, shows that this artist can moderate his pencil and bestow due consideration upon a subject when it pleases him. It is to be regretted that he does not indulge in that pleasure more frequently.

Carl Haag, although his works are always excellent, does not appear to show so prominently this year as we have seen him on former occasions. "Balbeck," with its fine ruins, and the robbers lurking in the shade waiting to surprise a caravan, is an interesting subject.

Mr. Alfred D. Frupp has greatly improved. "A Dorsetshire Shepherd Boy" is a very beautiful drawing, and remarkably refined in both treatment and colouring. Mr. George Frupp also deserves commendation. There is much excellent painting in the view of "Glencoe, Argylshire." A group of children on a piece of rock, which he calls "Specimens from the Mountains of North Wales," is not well sustained in execution; but "Moulford Ferry—on the Thames, near Streatly," is delightful in tone, elegant, without apparent labour, and in general effect is very true to nature. Mr. Palmer's works are quite as good this year, if not better than they have hitherto been. His glowing sunsets and ideal subjects are very pleasing, and it strikes us that he rises into the regions of poetry in his drawing of "The Fisherman's Wife," hailing the boat as it appears on the sunlit horizon after a storm. There is a very extraordinary composition, which must not be passed over, by Mr. Smallfield. It is "St. Francis preaching among the Birds," from the "Golden Legend." The mild and subdued light pervading the whole scene is suggestive of balmy quietude. The dark dresses of St. Francis and his companion add solemnity to the effect, while a calm devotion is expressed upon their features, and the feathered audience assembled on the branches of a leafless tree, at the foot of which are congregated those formed for the land and water, present an effect truly excellent.

Mr. Birket Foster sends eight of his very highly-finished and exquisite drawings: "A Loek," is luminous and picturesque; "Children with a Bird's Nest," is excellent; "Fishing," besides the charm of the execution, is pleasing from the evident interest the children take in the sport; but for beauty and breadth of tone, combined with the effect of fresh breeze and clear atmosphere, "On the Shore, Bonchurch, Isle of Wight," stands unequalled. David Cox, jun., has made an advance, because, without copying, he paints with more of the feeling of his late father. "Emancipation Oak—Holwood, Kent;" "An Avenue, Surrey;" and "Fairlight Mill, Sussex," may be taken as examples of his improvement in art. Mr. Richardson's "Amalfi" is fine; and "Off the Hills, Strath Braan, Perthshire," and "Bellaggio, Lake of Como," are quite as good. Mr. O. Oakley wisely treats his subjects in a low tone of colour, by which he draws attention on their humour and expression. "Turned Back," a boy who has failed to learn his task; "A Victim Approaching;" "Gipsies looking out for a Customer to have his or her Fortune told," and "Buy my Spring Flowers," have all the ease and movement of nature. "The Mountain of Glory: scene, Ardour, Argylshire," is one of those peculiar effects in which Mr. Alfred Newton delights. A very striking contrast is obtained by opposing the pink tints thrown by the setting sun upon the tops of the mountains to the delicately-ethereal blue of the sky; the whole subject is besides bathed in mild atmosphere and softened light. The large drawing by Mr. H. Gastineau of "Lago di Piano," shows much patient labour; it however wants well-placed and decisive accent to give it the vigour of nature; but

a "View near Cassel Cùrig, North Wales," is better in the latter respect, and has also something classical in its general conception. "View in the Forum at Rome—Morning," is a clever and firmly-executed drawing by Mr. Arthur Glennie. Mr. W. Hunt's minute imitations of fruit, flowers, and birds' nests are as successful as ever. Mr. George Dodgson has a spirited subject entitled "On the Banks of the Thames;" an excellent effect of light in that of "The Thames at Mile End;" and a remarkably clever and playful treatment of moonlight in a study from "Richmond Castle, Yorkshire." The small, but powerfully-executed heads by Mr. Burton, have attracted much notice this year. They are "The Wife of Hassan Aga" and "Yelitza." The same artist exhibits a third drawing of a child playing at cup and ball in a German kitchen, the whole of which is surprisingly clear, but impossibly clean. "A Harvest Home," by Mr. Walter Goodall, is a very meritorious work; the figures are dancing with lightness and spirit, the shadowing is managed with great skill, and the whole is a capital representation of the reality treated throughout with admirable taste. "The Driving to Fold—Sunset," and "Repose," by Mr. F. O. Finch, are both excellent, although the former might be made a little more decided in parts with advantage, but the latter has purity of style, and is, besides, very highly finished; and a "Canal Scene at Malines, Belgium," by J. Burgess, jun., is cleverly and forcibly executed.

THE NEW WATER-COLOUR SOCIETY.

53 Pall-Mall.

THERE is no great novelty to record in the exhibition of drawings in this gallery for the present year. The figure subjects may first claim our attention, and, commencing with the numbers in the catalogue, we come to "Falstaff's Visit to Ford's House;" but the artist, Mr. Wehnert, is so completely over-matched by the difficulty of his subject, that we cannot compliment him on any success in the attempt, but he seems more at home in the "Interior of the Church of St. Michael, near Tenbury, Worcestershire." Mr. Lee's "Asking a Blessing" is clever, but the child in the foreground is rather affected in attitude. "The Welcome Draught," by the same artist, is better. Mr. Carl Werner does not exhibit a single drawing, out of his six or seven, equal to several of his last year. "Garibaldi in Sicily," seated beneath the ruins of a Norman church, receiving offerings of horses and supplies from Sicilian peasants, is, we think, the best of his efforts. "Olivia," from Tennyson's Talking Oak, by Mr. John Absolon, is extremely well drawn, and treated with great taste, and the drawing is equally good in his "Courtship of Gainsborough." "The Parting Gift on a first Desert Journey—a Mother's Sainted Amulet," is one of those elaborate works which Mr. H. Warren generally exhibits at this gallery, consisting of Eastern travellers mounted on their camels, with one of those peculiar atmospheric effects which he manages with so much skill and taste. "The Card Trick," by Mr. L. Haghe, represents the interior of a guard-room, filled with idle soldiers, one of whom holding a pack of cards appears to be showing a comrade how the trick is done, and "The Salle d'Armes at Bruges," in which soldiers are fencing, are both good; but his most important drawing is entitled "Arnold of Brescia defending his opinions in a Consistory at Rome." He distinguished himself by being the founder of a sect which opposed the wealth and power of the Romish clergy. The whole of this drawing is executed with more decision than we often see in designs by Mr. L. Haghe.

Mr. Henry Tidy exhibits several drawings of single figures, treated with refined taste both in the tone of colouring and the style of the drawing. "The Keeper's Daughter, Jessie," "The Light Side of Irish Life," "Xarifa," and "The Last of the Abencerrages, from the French of Chateaubriand," are excellent in those respects. This last mentioned drawing contains several figures, and is the most elaborate work by this rising and talented artist exhibited in the gallery. Mr. Tidy created a sensation two years since by a poetical conception of "Queen Mab," and last year by an equally high conception from the poem of Dar-Thula, both of which are in the water-colour department at the International Exhibition; but the former is not hung according to its merits. "The Charcoal Burners," by Mrs. E. Murray, Teneriffe, is a Spanish subject, boldly executed. "The Bonnie Fish-wife," from the same hand, is a female of extraordinary dimensions, but whose dress is well painted; and the other production by this clever lady is "The Belle of the Market, Seville," which wants more unity in the general effect.

The landscape and sea pieces are about as numerous as usual, and we perceived no falling off in their merits. Mr. Thomas Boys sends some pretty scenes of buildings. We noticed "Silver Street, Salisbury," "Hampton Court from Mousley Lock," "An Old House at Rouen," and several others, executed in his usually pleasing manner. There is a good imitation of fire in "The Conflagration near Westminster," by Mr. W. Wyld. The distance is excellent, and the stone-work in the foreground well touched, in "Tintern, from the Porch of the Chapel on the Hill," by Mr. Chase. Mr. Rowbotham's view of "The birth-place of Masaniello," is an interesting scene, and is very elaborately executed. We, however, prefer the smaller works by this artist, on account of their being more directly derived from nature. Mrs. Harrison deserves praise for the delicate and tasteful style in which she treats her vases of flowers. Mr. Bennett's woodland scenery sustains his reputation, particularly the character he gives to his oaks overhanging the forest glade, and his waves breaking against rocks on the sea-shore, which have wonderful truth, and seem to fill the air with saline particles. We much prefer this masterly style of art, which reflects the impress of the artist's mind, as well as the general character of nature, to the photographic and individual truth recorded

in the drawings by Mr. Edmund Warren. They are no doubt marvels of close copying, displaying great powers of execution, much artistic skill in the choice of subject, truth in the retiring qualities of the atmosphere, as well as decision in the details of the foreground; and he sheds a quantity of light over the whole which gives considerable beauty to the effect; but still these views remind us more of the photograph and the labour of the artist than they affect us by the happy expression of his conceptions. Mr. E. Warren does not send so important a production as the "Wood Side" in the previous exhibition, and now in the English Water-colour Gallery at the International Exhibition. The "Hay-field," in the present collection in Pall-Mall, is the best of his contributions, having a very pleasing tone of colour and being less laboured in detail than some of his other drawings.

Mr. McKewan has sent sixteen specimens of his industry and talents. "Under the Oak," and "The Conqueror's Oak, Windsor," deserve attention; while the flatness of the water and the freedom of execution in the "Way Across the Brook," will also be admired. We think Mr. Fahey, the respected secretary of this institution, has been more successful than usual, particularly in his drawing of "Windsor from Clewer Mews," the distance of which is well lit, and the foreground harmoniously coloured. A pretty piece of mountain scenery, by the same artist, will be found in the view of "Miteside, Cumberland." Of coast scenery, Mr. J. Philp is an excellent representative. There is good composition in his "Oyster Packing," with a luminous effect in the sky, and busy groups on the sands, the whole being well subordinated to unity of design. Mr. Hayes has an excellent sea-view, entitled "A Dutch Brig Hove-to for a Pilot," which possesses merit from the manner in which the figures on the jetty are made to blend with the sky and to form a component part of the subject, instead of being rendered so distinct as to separate them from it—a mode of treatment we often see adopted, to the serious detriment of otherwise good pictures. In conclusion, we would direct attention to a very fine drawing by Mr. Charles Vaucher of "Taormina, Sicily." The distance is remarkably aerial, and the long line of ruins, forming the principal feature in the middle distance, is very picturesque in its irregularity, harmonious and varied in colour, and comes luminously off from the mist-producing plain below.

In the "Old" Society, as it is termed by way of distinction, there are 329 drawings, and in the New Society just concluded there are 333; it is therefore manifest that in these brief notices many meritorious works are unavoidably omitted; we must therefore recommend our readers to visit both the Societies and judge for themselves.

ST. JAMES'S NEW VESTRY HALL, PICCADILLY.

THIS building, now approaching completion, and of which we give a view on another page, has been erected by the Vestry of St. James's, Westminster, for the purpose of providing a more suitable and convenient place than they have hitherto possessed in which to hold their public meetings; but chiefly for the concentration and more economical performance of that portion of the parish business which comes immediately under their control, and which, at much inconvenience and expense, has been hitherto conducted in several offices.

The committee under whose superintendence the building has been erected, having obtained designs, instructed their surveyor to prepare plans, and accepted the tender of Messrs. Mansfield. The work was commenced in the early part of the summer of 1861, by the removal of an existing building, one of the best structures, both as to materials and workmanship, that it has been the architect's good fortune to see.

The difficulties that arose in the arrangement of the building consisted mainly in the confined space that was available for the purpose; the architect having strict instructions to encroach as little as possible upon the churchyard, and that any encroachment really necessary should be on the ground-floor only, leaving the soil below as far as practicable intact. To accomplish this, there has been no excavation under the rear rooms, the external wall towards the Churchyard being carried on wrought-iron girders, with a massive relieving arch over them, finished with tile arches in cement on smaller girders below.

The style adopted for the elevation is Italian, to correspond with, though not to imitate, the exterior of the church, the architect having attempted to produce something that should be simple, bold, and durable; care being taken that the character of a public building should be definitely given.

The materials adopted are red bricks and Portland stone. Instead of the bricks showing the arrises round the reveals of the windows, a molding has been substituted. It may be mentioned that the architect's original proposition was to execute the whole nearly as at present in red bricks, including moldings and enrichments.

The extremely confined space, and there being very little available basement, required a great deal of study to provide in the plans all that was necessary, and at the same time to avoid the appearance of being cramped, always fatal to architectural effect. This has perhaps, on the whole, been satisfactorily accomplished, though it has involved an amount of work in the plans and sections not usually given in so small a structure, and which would hardly have been attempted by many.

Entering at the principal doorway in Piccadilly, in which some originality of detail has been attempted, a lobby with spring doors is provided, paved with plain tiles arranged in patterns, and divided into four bays by plain pilasters; it has a semicircular ceiling and Welsh groins over the openings, two of these arches give access to the staircase, and columns are substituted for the pilasters. These columns have rouge royal marble

shafts in one piece, with Ionic caps and bases, executed in statuary marble, the cost of this being found not greatly to exceed that of scagliola, with cast-iron cores.

On the right is a room appropriated as a Savings Bank, and on the left the office for conducting the business of the Vestry, with the Vestry Clerk's private office leading from it. Opposite the principal entrance is the Rate Collector's Office. The hall and staircase has a second entrance from the churchyard. Underneath the landings and staircase, space for the necessary adjuncts is contrived by means of some descending steps.

Descending into the basement, formed of two long barrel vaults, previously existing and disturbed as little as possible, one only of which was available, we enter the Muniment Room, about 18 ft. x 11 ft., having one of Chubb's fire proof doors, and a gate within, to allow of the door being opened to admit air; to check damp and provide ventilation, an air chamber is formed all round with air bricks; there is also an air flue provided in the crown of the arch forming the ceiling; the fittings of this room consist of slate shelves on half brick piers, the floor is paved with plain square tiles set diagonally.

A large coal-cellar occupies another portion of the basement; and the space under the staircase is available for a variety of purposes, such as gas experiments. A sink and water supply is also provided. The basement generally was constructed in the early part of the present century, and has been left as nearly intact as circumstances would permit. The first floor contains the vestry hall and a committee-room, the vestry hall being about 38 ft. x 28 ft., and 18 ft. high, with a small gallery over the entrance from the staircase. The fireplaces are to be contrived under the centre window at each end, an arrangement that is in many ways satisfactory. This room and the committee-room have double sashes to all the windows, the inner ones being of wainscot, the doors and other woodwork in these rooms, together with the whole of the fittings, being of the same material. The committee-room communicates with the vestry hall and landing; it will also serve for a waiting-room for deputations, &c. Leading from the landing and vestry hall is a small retiring-room. This room has been obtained by throwing a wrought-iron girder across an angle and building on it. It contains a water-closet, urinal, and lavatory, and is finished below by small tile arches between iron girders, and above with a flat. Ascending the stairs, we reach the "Ratepayers' Gallery," a small gallery for the parishioners. On a level with this is a small room obtained by keeping the floor of the committee-room and staircase landing a foot below the vestry hall, which, giving 19 ft. clear, allows a committee-room 10 ft. 6 in. high, and an intermediate-room 7 ft. 6 in. high. This room is especially useful, as it is available from the first or second floor, and may be used with either. The windows of the vestry hall have plain architraves raised upon a dado, all in Keen's cement. The ceiling is to a certain extent "trabeated," following the constructional arrangement with a deep cove and small groins formed round the semicircular windows. The enrichments in the ceiling are mostly perforated, and are connected with ventilating flues. A supply of fresh air is to be obtained by opening a number of valves. The committee-room is provided with corresponding arrangements. The fireplaces in these rooms are of marble, inlaid with Minton's tiles, in panels of a severe pattern. The ceiling of the vestry hall, forming the floor of the rooms above, is carried principally by two stout queen post trusses, with wrought-iron tie-rods, preferable, in the opinion of the architect, to iron girders. All the piers between the windows are carried up in Portland cement, more for the purpose of guarding against unequal settlements than for any additional strength supposed to be acquired thereby. A double or "Victoria" flooring has been adopted in the vestry hall.

The second floor provides accommodation for an office-keeper, consisting of a sitting-room, fitted with range, sink, &c. &c.; two bed-rooms, water-closet, and closet for coats, &c., all entered from one door, and disconnected from the rest of the rooms on this floor, which comprise one large and three smaller rooms, available for any purpose that may be required.

The staircase has Portland stone spandril steps, and 5-in. Portland landings. Both the landings and steps are carried at the ends on wrought-iron girders, bracketed and plastered, with ornamental trusses or corbels against the walls. The windows will be glazed with coloured and ornamental glass. An enriched iron handrail, and mahogany capping, is continued as far as the Ratepayers' Gallery.

The main cistern is in the roof, supplying smaller ones near where they are required, the latter being also provided with independent services. The various water-closets, urinals, and lavatories are by Mr. Jennings, as are also the drain-pipes, and include his later improvements. The whole of the works have been most satisfactorily executed by Messrs. Mansfield, the amount of their contract being in round numbers £6,000.

The portion of the boundary wall to the churchyard, seen in the engraving, is part of an extensive series of works carried out under the superintendence of the rector and churchwardens, consisting of the boundary wall and gateway, an alms-house for distribution of alms daily, also various necessary adjuncts to the church, as coal, coke, and dust sheds, waterclosets, &c. In addition to these new works, the parish engine-house has been rendered more available for its purpose, the various walls pointed and repaired, the railings repaired and painted, and the "Green Churchyard," towards Jernyn Street is proposed to be completely renovated and rendered an ornament to the parish, instead of being a mere depository for rubbish as heretofore.

Mr. A. P. Howell, Surveyor to the Vestry, has designed and executed the building, ably and honestly seconded by Mr. George Ellverley as Clerk of the Works.

St. James's Vestry Hall, Piccadilly.

ARCHITECTURAL ASSOCIATION.

AN ordinary general meeting of this body was held on Friday evening, at the Rooms, 9 Conduit-street, Regent-street; Mr. THOMAS BLASHILL, Vice-President, in the chair.

Mr. C. J. ADAMS, hon. sec., read the minutes of the proceedings at the last meeting, which were found correct and confirmed.

New Members.—The following gentlemen, after a ballot, were duly elected Members of the Association.—Mr. John Eastby Goodchild, 22 Remington-street, City-road; Mr. H. J. Shepherd, 5 Prince-street, Chelsea; Mr. George Patrick, 18 Gloucester-villas, Loughborough-road, Brixton; Mr. T. Barker, 29 Offord-road, Barnsbury-park; Mr. John R. Gover, 7 Sydney-terrace, Portland-place, Clapham-road.

Nomination.—The following gentlemen were nominated for membership:—Mr. Henry Louis Florence, 30 Brixton-place, Brixton-road (proposed by Mr. Brooks, and seconded by Mr. H. Black).

The CHAIRMAN stated that Mr. Arthur Allom was prevented by unavoidable circumstances from reading the paper which he had intended to bring before the meeting that evening.

Mr. ADAMS, hon. sec., read a circular from the Northern Architectural Association, having reference to a proposed Architectural Alliance of Societies throughout the United Kingdom, the first meeting in promotion of which is to be held in London on the 1st of July. (The circular appeared in our last number.) It was agreed that the subject of the circular should be taken into consideration at a future meeting.

The CHAIRMAN, as one of the judges appointed to award the prizes which had recently been distributed, and as no report from the judges had yet been sent in, remarked that several of the designs for a town mansion were by very young students, and quite equal to what might have been expected from them, judging from their youth. The designs for tiles were very good, and indeed the judges were surprised at their general excellence. One competitor, Mr. Mosley, sent in a design in two colours, and though it did not get a prize, yet some discussion took place amongst the judges whether a prize should not be awarded to it, only two colours being used, and it being a very good design. In designs for tiles it was desirable that very few colours should be used, owing to the expense of manufacturing them. The design in tiles by Mr. Winbridge was an exceedingly good one, and its adoption would be found very useful. As regarded the prize for wall decoration the competition was very slight, there being but three competitors, and that was not to be surprised at owing to a want of information and experience on the subject. He had brought with him two or three engraved copies of a drawing which he made a few years ago of a sepulchral slab, which he found in Maunsell Gunnage, Herefordshire, and in which was a great deal of foliage executed in a most excellent manner. He thought that many gentlemen who made designs in which foliage entered, did not sufficiently study the subject to make their designs effective. The Chairman then proceeded to make drawings on the black-board, explanatory of the root, the stem, the leaves, the flowers, and the branches of various plants, and explained how most plants had a beginning and a growth.

Mr. R. O. HARRIS thought that a too strict adherence to botanical treatment in architectural design would lead them to forget the very best of the conventional treatment of the *Cinque cento* period.

Mr. STIERS moved a vote of thanks to Mr. Blashill for the observations he had made on botany as applicable to architecture, and in so doing referred to some beautiful specimens of metal-work at the Great International Exhibition in which conventional foliage was introduced.

Mr. C. H. F. LEWES seconded the motion, and said he thought that foliage, when introduced into architecture, ought always to be conventionalised.

The vote of thanks to Mr. Blashill was carried by acclamation, and the meeting separated.

LIVERPOOL ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETY.

THE fourteenth annual meeting of this society took place on Wednesday sennight, at the Royal Institution, Colquitt Street. Mr. J. M. HAY, the president of the society, occupied the chair.

Mr. W. H. WEIGHTMAN was elected president for the ensuing year, and Messrs. GOODALL and KILPIN vice-presidents.

A motion was carried that delegates be sent to London to attend a meeting of "The Architectural Alliance." Mr. Stubbs, Mr. Weightman, and Mr. J. M. Hay were elected the delegates.

The PRESIDENT, after alluding to local matters, including the death of his brother, spoke of

STREET ARCHITECTURE.

The architectural aspect of our streets, said he, is improving. Our public buildings and palatial piles of offices are gradually becoming the true and consistent exponents of the wealth and commercial greatness of the town; and no one can view with indifference the desire of our municipal government to open up new lines of communication, and to widen and improve the present overcrowded thoroughfares. That the execution of such projects will be costly is true, but not more true than that their accomplishment will be vastly more expensive if delayed till it becomes an absolute necessity. I am glad to find that greater attention is being every day paid by architects, both Gothic and classic, to the sculptural departments of design. This is progress; for sculpture, whatever it is on its own account, is certainly an important auxiliary branch of architecture, and her mission is not fulfilled unless developed to the utmost in the embellishment of architecture. Sculpture, as well as painting, were created, or at least chiefly exist, for the adornment of architecture, which may justly be considered as the mother or elder art; and without the calls she has from time to time made upon them, the great master-pieces of painting and sculpture, the frescoes and arabesques of Angelo, Raphael, Da Vinci, and Correggio, would

probably never have had an existence. Both sculpture and painting have ever, indeed, yielded their grandest effects in combination with architecture. In the greatest styles the world ever saw—the Egyptian, the Assyrian, the Greek, the Byzantine, the Gothic, and Italian of the *Cinque cento* period—the union of the three arts was at its highest pitch; and the greatest works of painting and sculpture were produced as architectural embellishments. Michael Angelo, Raphael, and Correggio, were wall and ceiling painters to their contemporaries. Painting, sculpture, and architecture are indeed three branches of our art which, divided, are comparatively weak and meaningless, but united appear in their full strength, and yield their sublimest tones, "their grand consummate harmony." It is evident that the architects of the great styles I have referred to thus considered them, and made them foster and adorn each other, and this they may ever do. While architecture inspires the sculptor, sculpture may be regarded as the interpreter of architecture, to which it imparts more vivid and distinct expression. There was a time when the chief architects knew more about sculpture than architecture, and were greater sculptors than they were architects. I refer to the great period ushered in by the revival of art in Italy before alluded to. These great artists I know have been cried out against as having too much subjected architecture to the requirements of sculpture; and, indeed, it is true that they introduced, and gave currency to many flagrant abuses, both in composition and detail, but it is also true that they greatly advanced architectural design by their masterly application of sculpture and painting to its enrichment, and by the thorough indissoluble combination of the three arts in many a successful and glorious conception. In their hands architecture regained much of what she had lost in the hands of the ancient Romans—if not all the purity and delicacy and finish of the Greeks, at least nearly all of the completeness, and much of the refinement of form, which had given place, in the hands of the Roman conquerors of the world, to luxuriance and richness, as more in harmony with the sentiments and character of that magnificent people. The greatest event of the present year is the International Exhibition, which was inaugurated last week with all the pomp and splendour that rank, intellect, and wealth could confer. That marvellous collection of the art and industrial products of every nation and of every clime is now open to the world. It forms, as it were, a mighty volume, on whose pages are inscribed instruction for every class and condition of men, from the philosopher and artist down to the humblest mechanic. Even the mere holiday seeker, who listlessly walks through its galleries with the eyes of his mind half closed, will carry home with him some vague impression of the night and majesty of intellectual power. But to the earnest thoughtful soul, the results of such an Exhibition will be incalculable. It is a grand competitive contest on a universal scale, where the laudable ambition of nations and individuals conspires to the welfare and happiness of the whole human family. It is the development of the grand principles of free trade into the higher phase of the free interchange of thought, tending towards the perfection of every product of art and ingenuity. I am glad to know that our own art is so well represented in this Exhibition, and that the models and designs sustain in so high a degree the architectural reputation of our countrymen.

After allusion to the late Prince Albert, the PRESIDENT gave some good

SUGGESTIONS TO STUDENTS.

Let me, said the President, again impress on the mind of the student at the breaking up of the session the necessity of regarding the instruction he gains here as only one subordinate and elementary means of raising himself into the dignity of an architect. No teaching is complete, or indeed of any avail, until the pupil becomes his own teacher, and receives instruction actively rather than passively. Every true architect, strange as it may sound in your ears, though he may have passed a dozen apprenticeships, and been educated by royal or imperial chartered academies, is in reality self-taught, because he cannot become an architect but by *thought*, which no external appliance is in itself sufficient to create. It is your own thought that must render all instruction vital, convert all material into intellectual chyle or blood for the nourishment of the mind and imagination. Without thought it is all a dead letter and of no value. It is thought on the part of the architect that lies at the root of the greatness of Greek and mediævalist. Were Government to endow this society with a rich income, and appoint the most eminent professors to lecture weekly to you from this chair, the secret of its strength must still be in the activity of your own minds. Art will not come at the call of a legislature, nor repeat in England her history in Greece. Earnest thought and diligent practice are what is necessary to bring out the hidden might of architecture and of its professors. It is this that will drive you to make proper use of every means and appliance rightly to employ the elements and principles of Greek, Roman, and mediæval remains. It will lead you to look to the remains of the past in a spirit of metaphysical induction rather than of that literal and physical imitation which has strewed the land with mere copies of ancient examples. You have every motive for exertion. Every consideration to inspire emulation and ambition may be drawn from your situation and prospects. Architecture is sometimes called the grandest of the arts, and when it has duly drawn upon the resources still possessed in the kindred arts of design she is clearly entitled to the epithet. Certainly there are no detached works of the painter or sculptor can call up such emotions of the sublime as many architectural works which could be named,—the temple of Karnac; the Parthenon and Erechtheum; the mosque of St. Sophia; the cathedrals of Germany, Spain, France, England, Italy; the Alhambra; the Indian tombs and palaces; St. Peter's; St. Paul's. But the Gothic cathedrals alone are sufficient to cite as evidence of the power of architecture to produce the sublime beyond any other art of man. The towering pillars and arcades forming and supporting the long drawn aisle and fretted vault, symbolising at once eternity and immensity; the ever recurring, ever varying vista and expanse; light imposed upon and heightening and brightening light; shade deepening shade; richness increasing richness, fill the mind with an awe and amazement that few of the works of the Creator could increase. Let us not suppose that architecture is effete, that she died in giving birth to these prodigies, that it cannot grow with the age, and yield obedience to the requirements that new circumstances create. There are no requirements possible in the whole range of public or domestic life which architecture cannot adapt itself to, or rather, form itself upon. There are principles in architecture of eternal obligation, which cannot be laid aside without loss of significance and beauty. But he who thoroughly understands the principles of architecture, and has any adequate measure of inventive power, will be able ever to apply them to new embodiments that new wants and occasions call into existence, making submission to

their dictates a further opportunity of ringing the changes upon the beautiful and true.—Gentlemen, professional men, associates, and students, in addressing you for the last time from this chair, I cannot but refer to the great pleasure I have experienced in attending your meetings here from time to time. The benefits I have received are great—those I have conferred are small. I have, however, the gratification of handing over to my successor the interests and condition of this society not less valuable nor less useful than they were when I was entrusted with them, but with the full conviction that he will more worthily represent the interests of the society than I myself have done.

The proceedings terminated by votes of thanks to the various officers and the council.

THE NEW CAVALRY BARRACKS AT COLCHESTER.

THE erection of these barracks, for which a considerable amount was appropriated by Parliamentary grant early in the present Session, has now been fairly commenced by Messrs. Lucas, Brothers, the contractors for the works. The erections will be solid and permanent. The walls will be built of red brick externally, and of the uniform thickness of 18 inches.

The principal block of buildings will be that used by the officers, which is in the form of a quadrangle 151 feet in length, having wings 71 feet in depth, with ground, first, and second floors. In the centre of this quadrangle the officers' mess-room will be built. This room will be 50 feet in length by 24 feet in width, having a capacious ante-room, with kitchen and mess men's quarters, and eight rooms in the rear, with extensive cellars. The entire ground floor of the other portions of the quadrangle will be devoted to the servants of the officers; whilst on the first floor, right and left of the mess, will be the quarters of the commanding and field officers, and the sitting-rooms and bed-rooms of the officers. The second floor will be devoted to the same purpose, except that the quarters of the commanding officer will comprise all the rooms on both floors; whilst over the field officers' rooms will be those appropriated to the use of the surgeon. One novel feature in these barracks will be the introduction of corridors or verandahs, one of which will be constructed completely round this quadrangle, about 8 feet in width and 10 feet in height in front; the roof, which is to be formed of corrugated iron, will be supported by elegant iron columns, and the flooring will be covered with York paving, thus forming a lengthened promenade in all weathers.

Immediately behind the officers' quarters will be the barracks, consisting of four blocks for 72 men each, independent of non-commissioned officers. Each of these blocks will be two stories high, the principal room being the barrack-room, 53 feet by 20, with sergeants' quarters, and lavatories and latrines at each end. Around these buildings also there will be formed a corridor, 7 feet 6 inches in width, paved with York flag, and glazed in those portions of the roof which immediately adjoin the windows.

On the western side of the ground will be constructed the stables, which will include all the modern arrangements and fittings. They stand in precisely the same order as the quarters for the men, the officers' stables being first, and the troop stables adjoining. The stables for officers form two blocks, the entire length of the building, including the store-rooms, being 160 feet by 35 feet in width.

The troop stables will correspond in their number with the quarters for the men, there being four blocks of them. These will each be 179 feet in length, exclusive of troop stores, and 37 feet in width; the troop stores will be 9 feet by 19 feet, and no less than six entrances to the stables will be provided. To each of these blocks will be attached four litter sheds, each 6 feet by 37 feet, precisely corresponding with those attached to the officers' stables.

Between the soldiers' barracks and the troop stables will be the cook-house for the men, 25 feet square and 12 feet high, brick and slated, and crowned with a large Louvre ventilator.

The quarters for the staff-sergeants consist of a building of two stories, 121 feet in length by 37 feet 6 inches in width, so as to provide the requisite accommodation of a sitting-room and bed-room for each man, the want of which has been so much felt in the Infantry Barracks. These rooms will be 17 feet by 14 feet 6 inches, and of proportionate height—a size equal to the principal rooms in many of our middle-class houses.

There is also to be a regimental reading-room, and, for the children, a commodious schoolroom, with residence for the mistress.

Near to the artesian well will be erected the barrack stores, 129 feet by 27 feet 6 inches, having its back to the Laver Road, to which it will form a sort of boundary wall.

There will also be constructed the customary baths and latrines; and farther down the Laver Road, the quarter-master's stores, 155 feet by 22 feet 6 inches, and the shoeing shed, 50 feet by 16 feet.

Some notion may be formed of the extent of these barracks from the fact that upwards of 7,000,000 bricks will be used in their construction.

The entire superintendence of the work is entrusted to Mr. Mitchell, the contractors' manager.

THE HEREFORD CATHEDRAL SCREEN IN THE GREAT EXHIBITION.

LAST year, says the *Daily News*, as the crowning work of the restoration of Lichfield cathedral, a new choir-screen was executed by Mr. Skidmore, in metal-work, after designs by Mr. Scott. This screen, then the most important example of modern architectural metal-work, proved a triumphant success. It had no rival, indeed, because it was alone amongst the choir-screens of our cathedrals, as a work exclusively of iron, and brass, and copper; but then it also stood above rivalry on the high ground of its own artistic and architectural merits. Thus, in the Lichfield screen an absolutely successful experiment was achieved; and it was conclusive as a demonstration both of the admirable qualities of metal architecture and of the ability of living English architects and artists to work in the metals. The Lichfield screen, however, has not long been left to vindicate, unsupported, the eminent architectural capacities of iron and its metal allies. Mr. Scott has for some time been intrusted with the restoration of Hereford cathedral, and in January last his suggestion was approved by the Hereford dean and chapter, that the required choir-screen should be executed in metal-work for their cathedral; and, with the Lichfield screen fresh in his remembrance, Mr. Scott again placed his drawings in the hands of the distinguished architectural metal-worker of Coventry.

Mr. Skidmore at once entered upon this new work with the most determined energy; and, notwithstanding the short space of time that was before him, he undertook to place the Hereford screen in the Great Exhibition, as an example of the English metal architecture of 1862. In the Great Exhibition, a little to the south of the eastern dome, this noble work now stands—not quite complete in certain matters of minor detail, and necessarily deprived of all the felicitous associations that will gather thickly around it in its ultimate resting-place beneath the choir-arch of Hereford.

It must be borne in mind that this screen has been designed to take its place in one of our cathedrals in our own times, and with a view to the requirements not of the era of the Plantagenets, but of that of Queen Victoria. It has been purposely constructed, therefore, of open-work, which may distinguish between two parts of a cathedral without at all shutting off one of them from the other. When in its proper place the two extremities of this screen will abut upon the walls of the choir, and thus the entire work will assume that appearance of consolidated strength for which it must depend upon the masonry of its cathedral. The composition, while equally true to the Gothic style and equally consistent with the character of a cathedral screen, in its treatment differs altogether from that of the kindred work at Lichfield. It is an arcade of five arches; but each arch is divided into two sub-arches, so that there are five pairs of secondary arches, as well as a like number of primary arches. The central arch, which forms the gateway, is of bolder proportions than the rest, and it is surmounted by a lofty pedimental canopy, acutely angled, and having its slopes formed of straight lines. The principal structural members are for the most part all of iron. The shafts of the first order are partly of brass and partly of iron; and the smaller shafts are entirely of brass. The sweeps of the arch-heads are also of brass, splendidly enriched with vitreous mosaic in bold and most effective masses. The canopy of the central arch is surmounted by a simple cross of large size and rich adornment, and the crochets are bunches of flowers and leaves in iron-work of singular beauty. Within this canopy is an ample panel of the pointed vesica form, surmounted by a circle. The cusplings and traceries and the lower panels of all the arches are of the most elaborate and delicate iron-work, wrought with such marvellous refinement of treatment that the whole may be styled a mass of iron filigree. Equally delicate and skilful is the treatment of the capitals and corbels, which, with the cornice and many of the decorative details, are executed in copper, beaten with the point of the hammer after the early manner from the sheet of the metal. In part closely studied from natural forms and in part happily adapted to the purest Gothic conventionalisms of foliage, these copper capitals show how completely Mr. Skidmore is master of the material in which he delights to work. They may be studied, with equally gratifying results, both as examples of metal-work of the highest order and as noble pieces of architectural detail. The four main arches of the screen, two of which are on either side of the central canopied arch, like the central arch itself, have their spandrels most richly traceried. These arches are surmounted by a frieze and cornice, the whole being crowned by a parapet covered with scale-like brazen tiles. At present the ridge is quite plain, but ultimately it will probably receive a low but richly-wrought cresting, with pinnacles to mark the points of division between the arches.

At Lichfield, on either side of the central arch, are four figures of angels, one of them standing in front of the spandrel between each pair of the arches of the arcade; and these angel figures represent a celestial choir, all of them being engaged either in playing on instruments of music or in the act of vocal praise.

In the Hereford screen a group of two angelic figures, winged with wings of a most unearthly fashion, stands as in adoration, boldly corbelled out from above the capitals of the clustered jamb-shafts of the central arch; and, at either extremity of the composition, placed precisely in a similar position, a single figure of a winged angel appears to be playing upon a musical instrument. In the centre of the whole, supported by a corbel that rises gracefully from the capital of the slender central shaft, there stands a figure of the Saviour as in the act of resurrection. Beneath His feet, entwined amidst the foliage of the capital and the corbel, are bunches of passion-flowers, tenderly wrought in copper.

Like the Lichfield angels, all these figures are executed in copper, which will retain the rich natural colour of the metal. In like manner, all the details that have been produced in the same metal retain the true colour of the copper itself. The brass-work is everywhere unvarnished; and where it comes into contact with the sparkling masses of mosaic, its surfaces are studded with jewels. The iron is all painted or gilt, the gilding having been most judiciously applied with a sparing hand. The colours, with the sole exception of the greens, are all oxides of iron, and thus they may be assumed to be the natural colours which iron itself should receive from the artist. The whole of the colouring has been most carefully studied, and when it is seen in the subdued light of the cathedral it will unquestionably produce an eminently beautiful effect.

With the screen there will be associated in Hereford Cathedral a large and splendid gas corona, and also two standards, all of them of the same iron filigree work with the screen itself. In the Great Exhibition the corona hangs a little to the northward of the screen, and one of the standards is grouped with three others, that are severally destined to give such light as may be given by gas-jets in the cathedrals of Lichfield, Norwich, and Calcutta. The ready facility with which Mr. Skidmore adapts the iron to whatever uses it may be required to serve, and his unswerving fidelity to true architectural art, are vividly shown in these productions. While most happily suited for gas lighting, both standards and corona are true in every detail to Gothic feeling. The corona is indeed a worthy companion to the screen. Conical in its general form, it is composed of three tiers of arches which diverge about a central shaft. The arches are elaborately traceried, and the coronet-like circle from which the lower arches spring, similarly enriched, is studded with clusters of gas jets, and richly adorned with large pieces of transparent crystal-like substance that will not fail to enhance the effectiveness of the gas illumination. In addition to the circle of jets, seven standards, rising at right angles to them from as many radiating pipes, surround the whole, and are crowned each with its own cluster of jets.

TOTAL ABSTAINERS' PARK, GLASGOW.—The Abstainers' Union in this city have leased and opened a park opposite Kelvin Grove, containing nearly forty acres, portions of which they have dressed up in a neat manner. A gymnasium and quoit-ground have also been provided, besides accommodations for all sorts of games.

POTTERY IN THE INTERNATIONAL EXHIBITION.

AFTER a rapid survey of what has been as yet unveiled by exhibitors of pottery and porcelain, both British and foreign, in the International Exhibition, we must confess to feeling, on the whole, a justifiable pride in the productions of our pottery towns. Just step into what is decidedly the best-arranged china establishment in the Exhibition, that belonging to Messrs. Minton and Co., of Stoke-upon-Trent. Glance at those divine little vases of Celadon china, with their delicate white cords and lovely fern-leaves. There is one of those vases which is not quite so charming as the others. Its beauty has been marred by a quantity of tasteless gilding. In the manufacture of majolica vases this firm is clearly unapproached and unapproachable. Many of their articles are, indeed, magnificent triumphs of the potter's art, but some few of the designs are singularly repulsive. There is a huge vase adorned with villainous-looking satyrs' heads. The spectator turns with disgust from those vicious, pallid faces, those horrid pale-pink lips, and ugly protruded pale-pink tongues. There is a grand pair of porcelain vases with large, boldly-painted wreaths of roses and handsome snake handles, to which the hue of dead gold has been imparted. These are rather heavy and stylish articles, and are much admired, but their design is very faulty. It is not well to let our eyes travel beyond the lower limits of the vase. That large and beautiful article with those lordly rams' heads looking forth from its sides, is poised upon the shoulders of some three or four pretty little children, whose faces cannot be seen, for they are bent earthwards. All this is positively painful. When you see Atlas carrying the world on his shoulders, you glance at the lusty fellow's splendid muscular development, and have no fears that the huge ball will break his spine and crush every square inch of his body. But here the idea is very different. The little vase-bearers are mere babies, and should be flying about in a carriage drawn by doves instead of groaning under a huge burden of porcelain.

Etruria is well represented in the Exhibition by the grandson of the celebrated Wedgwood. The manufacture of those beautiful vases of light-blue jasper has only recently been revived. They were out of fashion, it seems, for some twenty years or so. There is a huge specimen with lovely white bas-reliefs, representing a sacrificer, and some fine heads of goats and wild boars, with magnificent borders of oak and laurel-leaves. It is the largest thing of the kind ever made, being three feet high and two feet across at the top.

Alderman Copeland's collection of Parian figures is surpassed by that of no other exhibitor. We particularly direct attention to the statuette of Beatrice.

"With regal step, and look wherein disdain
As pictured, still proceeding, thus she said
(Like one who doth her bitterest fault retain):
'Yes, I am Beatrice—regard me well!'"

In the alderman's glass cases are to be seen some exquisite specimens of landscape-painting on porcelain.

The French courts, especially that devoted to the exhibition of articles from the imperial manufactory at Sèvres, is particularly rich in that beautiful description of porcelain called Celadon, to which we have already called attention. Celadon, on account of its exceedingly brittle nature, is very difficult to manufacture, and in France, indeed, is made only at Sèvres. The specimens here exhibited consist of several large vases, very graceful in form, like most objects of art turned out by our highly artistic friends across the Channel. The following is the process employed. First, the vase is modelled, and the figures put on with a brush. Then the vase is put into a glaze, after which it is gradually and tenderly introduced into an oven. Just look at those raised white figures on that fine stone-coloured ground. Place a light within the vase, when the shades of evening have fallen, and vase and figures will suddenly assume the loveliest of rose-coloured tints. In M. Hadrot's fine collection of porcelain we were particularly struck with some beautiful articles in Celadon which had been made for the Emperor and Empress of the French. These consist of an oval vase and two lamps. On one of the latter is finely painted the head of Napoleon III.; on the other is an exquisite likeness of the Empress Eugénie. The price of the Imperial lamps is about £6 each.

In the porcelain exhibited by M. Jullien there is an exquisitely beautiful tea service in what is styled metallic gold, and an equally beautiful coffee service in metallic emerald. We confidently predict that during the months of May, June, July, August, and September, sighs enough to turn a mill will daily be breathed from rosy lips over those delicious bits of china. We earnestly recommend the exhibitor of those treasures to look better after them than he has hitherto done, or some day he will, on returning to his stall, find himself the victim of some fair porcelain kleptomaniac. Amongst the Sèvres porcelain we noted a pretty vase, of the celebrated colour styled *Rose du Barri*. This colour is painted on. Limoges exhibits some fine pieces of china. A magnificent central piece of biscuit paste, with enamel, is one of its most noteworthy contributions. M. Pouat, from that quarter, exhibits a collection of plates, cups, saucers, teapots, &c., in a beautiful white porcelain, which is totally without flaw, and almost transparent.

Some of the best imitations of the strangest sort of Palissy ware are to be found under the French flag. Most readers know how fond that enthusiastic designer, Bernard Palissy, was of constructing plates and dishes representing the bottom of the sea, covered with shells, pebbles, and seaweeds, fishes and snakes, and how he gave to those plates and dishes with their contents the name of rustic pieces; and also how speedily this strange species of ware became the fashion in France and England. We strongly

recommend a visit to those imitations of Palissy. Perhaps the strangest article of the lot is a large oval looking-glass with a frame which would have delighted the great Bernard himself, covered as it is with lizards, fishes, tortoises, marine plants, frogs, beetles, sea shells, and surmounted by a naked little urchin who lustily blows his conch. Underneath the fish and reptile mirror are a great number of plates and dishes which swarm with creatures of the kinds we have already specified, and jugs in the shape of sea monsters with mouths horribly agape. On the lowest range are three dishes far superior in workmanship to the other articles exhibited. In one of these dishes the principal figure is a pike, the skin of which is excellently rendered. Grouped round this ravenous creature are lizards, shell fish, leaves, &c. In another dish a handsome snake seems engaged in mesmerising an unhappy frog, of a bright green colour. In the third and last of our dishes of predilection a well-developed perch, wonderfully natural in form and colour, is the piscatory centre of attraction, and decidedly will be the observed of all tasteful observers.

From the great manufactory of Dresden china, at Meissen, we have a very large display of vases and human figures. In the vases every detail is carefully given; but there is a remarkable superabundance of ornament. In this Saxon department there are some prettily-shaped but badly coloured lace figures. We were much struck here with a cup, cover, and stand of emerald-coloured porcelain. The colour is singularly even. Our very old friend, the Chinaman, represented in the act of singing and accompanying himself on a musical instrument, confronts us under the Saxon banner. His wrinkles and unmistakable "rule the roast" expression are as strongly marked as usual, and he still wears his old coat of that peculiar reddish brown hue which we have never seen in any porcelain save that of Dresden. Opposite him is his wife, as submissive looking and uninteresting as ever. After visiting the old vagabond Chinaman, let not the reader forget to glance at those pretty water bottles of terra-cotta, ornamented with raised figures, not very remarkable for their execution.

In the Berlin collection there is some very perfect painting on porcelain. We strongly recommend our English manufacturers to have a look at the beautiful colours, more especially the greens and blues, for which the Prussian china is remarkable. The Berlin vases want, as a rule, that lightness and elegance for which the French vases are pre-eminent. But no one can pick a hole in the splendid Parian nautilus shell, with its lovely mermaid supporters.

In various courts, both British and foreign, there are to be seen exceedingly elegant imitations of Greek and Egyptian vases. We are surprised that no ingenious and enterprising manufacturer has thought of copying a few of those clay books prepared many centuries before Christ by the cunning hand of the Assyrian potter, and lighted on some years ago by the indefatigable Mr. Layard in the palace of the mighty Sennacherib. The library of that prince seems to have consisted of at least 2,000 brick volumes of various shapes and sizes, many of them fashioned like cylinders, not a few six-sided, and for subjects relating to all manner of things. There were to be found primers in clay, old almanacs in clay, receipts (stamped, of course) in clay; love letters and business letters in clay; history books in clay. These old bricks, according to that most erudite of antiquaries, Mr. Samuel Birch, are composed of clay and straw, and were dried in the sun.

CHURCH, CHAPEL, AND SCHOOL BUILDING.

READING.—The conveyance of the Greyfriars' Church here, for many years used as the town Bridewell, has been executed by the Corporation, with the consent of the Lords of the Treasury, to the Rev. W. W. Phelps, who has collected half of the £10,000 required for its restoration.

SOUTHPORT.—The foundation-stone of a new church has just been laid at Ecclesfield, Southport, by Lord Skelmersdale. The building will accommodate about 1,000.

HUXTS.—Mr. Edes is about to restore the Church of Spaldwick in this county. It has some good points—three screens in original position, separating the nave and chancel, the aisles and chantry chapel, and the chapel and chancel. There remain traces of the rood loft on the jambs of the chancel arch, and two sixteenth century seats remaining, together with some Norman mouldings.

OXFORD.—The new church of St. Giles's was consecrated a few days since. The style adopted is the Gothic. The plan embraces a nave, with an aisle on each side; the chancel, formed under the tower, with an apse at the east end; and north and south transepts abutting from the tower. The vestry is on the north side. The approaches are from the west end, a porch leading to the south aisle, and a door in the end of the south transept. The tower stands at the east of the nave, between the apse and transept, and is intended to be surmounted by a lofty spire. In the interior are some peculiar features. The columns supporting the clerestory walls are solid blocks of polished Aberdeen granite. The groining in the chancel roof is in bands of different coloured stonework, springing from polished Devonshire marble columns. The same kind of columns are also used in the sedilia, and in the windows of the aisles. The roof of the nave is arched with plain boarding and moulded ribs, the only timbers showing being the cross-beams and ring-posts. The roof altogether is by no means plain, being decorated with painting in bands and panels of brilliant colours. The height of the roof is sixty feet. The floors are laid with tiles, in patterns of various colours and designs, the chancel being of Minton's encaustic work. The tiling is also used against the wall of the apse to the height of the window-sills. The altar, of oak, stands against a stone wall, intended to support the reredos. Oak screens, in connection with the choir stalls, are placed

across the transept. The pulpit is in stone, marble, and alabaster. The font is of different-coloured stone, elevated on a floor laid with ornamental tiles and marble squares. The cost, up to the present time, has been about £7,000, leaving the carving, sittings, and spire to be provided for. These will cost nearly £2,000 more. The architect is G. E. Street, Esq., London; the builders, Messrs. Joseph Castle, of Oxford.

YORKSHIRE.—Aberford Church has just been re-opened, after undergoing the process of restoration. The design is Mr. Salvin's, and is in the early decorated style. The building is entered by a porch on the south. The windows are all decorated with corbels. The east window is of stained glass. The pulpit is of Cuen stone, on short pilasters of Cornish serpentine marble. The north and south aisles are separated from the nave by colonnades, which contain four pillars and arches. The nave is lighted by sixteen clerestory trefoil windows; the north aisle by four two-light windows, while the south has a lesser number, owing to the presence of two doors. The roof is open, of light appearance, the timber stained and varnished. The whole is supported on corbels and ribs, forming circular arches. At the west end of the church, there being no arch into the tower, is a small and light gallery. The expense of restoration has been about £3,000.

WESTBURY-ON-TYDM.—The beautiful reredos, which is carried round the apse of the chancel of the Church of the Holy Trinity, SS. Peter and Paul, in this place, is now uncovered. The following description of this work of art we cull from a local contemporary:—"The stone-work was finished about this time last year, and consists of a large centre panel, containing 'The Last Supper,' carved in high relief, adapted from the great fresco, by Raphael, in the suppressed monastery of St. Onofrio, at Florence. This occupies the whole of the space over the communion table, under a beautiful canopy, surmounted by a figure of 'The Good Shepherd.' On either side of the apse is an arcade of four arches, with recessed panels. Colour has been very sparingly introduced into the central subject, as the bold relief of the sculpture does not require such addition. The nimbi of the heads are gilded, as well as the diapered background. The first and second tables of the decalogue are introduced into the first and third panels on the north side, and the Creed and the Lord's Prayer into the first and third panels on the south side. The lettering is of a distinct character, with illuminated and gilded capitals, and other ornaments introduced. This occupies four out of the eight panels. The ground-work of the remaining four panels is coloured with rich diaper work, and two large medallions painted in each. The western panel, on the north side, has the cross keys and sword, as being the emblems of the dedication of the church, and the pelican as emblematical of the atonement. The opposite panel on the south side has the Agnus Dei, and the monogram of the sacred name. The four medallions in the centre of the eanted side of the apse have the symbols of the four Evangelists. The buttresses, cusplings, crocketings, Tudor flower-crests and angel-finals, surmounting the canopies, and coloured so as to harmonise with the general effect, relieved with gold, properly used in the upper portions of the work, in order to reflect the light which falls upon them, produce a general rich and brilliant effect, which, blending with the four beautifully painted windows by O'Connor above, form an admirable continuation of colour. This arrangement of colour is in strict accordance with the practice of treating works of a similar character in our ancient parish churches, and that something of the sort did exist at Westbury church is proved beyond doubt by the number of fragments of alabaster figures, richly painted and gilded, discovered beneath the floor of the chancel when it was repaired. The modern roof is the only part which detracts from the beautiful appearance of the chancel, being of painted deal, and of a poor and miserable design." The whole of the works carried out in this church have been under the direction of John Norton, Esq., architect, of 24 Old Bond Street, London, and Park Street, Bristol. The colouring and decorating the reredos were entrusted to Mr. Castell, of 45 South Moulton Street, London. The stone work and carving are by Farmer, of London.

BICESTER CHURCH.—A subscription, headed by the Bishop of Oxford, has been set on foot for the restoration of this church, which is one of the largest in the diocese. It is contemplated to take down the whole of the galleries, restore the chancel, re-seat the church with open pews, and to introduce a stained glass window or two. The cost is estimated at £3,000, about a half of which sum has already been subscribed. We hear that the plans of Mr. Beazley, of Gower Street, have been adopted, and trust that every dutiful son of the Church will aid in the good work.

SCHOOLS.

STAFFORD.—The new Grammar School here has just been finished. It is built in a modified Gothic style, of brick, with white stone dressings. The erection is divided into two chambers—each apartment being about 70 by 30 feet. The roof is of open timber, and of considerable altitude. The windows are large, and shed a flood of light and cheerfulness in upon the scholar. Mr. Ward is the architect, and Mr. Espley the builder. Its cost is about £3,000. We may also add, that the master's house adjoining contains several special class-rooms. On its top story are sleeping apartments for boarders, having direct communication with the school by means of a winding staircase in a little bell-turret at the side of the building.

KINGSLEY AND WHISTON.—The trustees of the endowed schools at these places are about to erect new school buildings. In the first the buildings comprise schools for boys, girls, and infants, with class-rooms; residences for both master and mistress, and play-grounds and conveniences for each school. In the latter place, an infant-school and residence for the mistress will be erected. The architect is Mr. Sugden, of Leek.

ABERDEEN.—A few days since the foundation-stone of a memorial school was laid, in connection with the church of St. John the Evangelist. It will be called the Cheyno School, will be erected in the Gothic style (so as to be in harmony with the church), and will cost £1,200.

SCARBOROUGH.—Last week the foundation-stone of a new Sunday-school, in connection with the Bar Church, was laid. It will be twice the size of the former one, and, with the site, will cost over £1,000.

SCIENCE AND ART DEPARTMENT.

ON Friday last the House of Commons went into committee and supply. On the vote of £116,695 for the science and art department, an interesting conversation took place. After Mr. Adderley, Mr. Lowe, and Mr. Cogan had made some observations on the Museum of Irish Industry and Sir Robert Kane, Mr. Dillwyn said he doubted the propriety of soliciting the public money for schools of art, however useful they might be in themselves. He doubted the advantages of government aid in promoting art. That art and manufactures had advanced of late he had no doubt; but it was due, he believed, to the impetus given by the Exhibition of 1851, and which was being repeated in the Exhibition of the present year, and the competition thus occasioned, rather than to any direct government aid in the shape of art schools. He therefore proposed that the vote should be reduced by the excess on this account over the vote of last year. He moved to strike off from the total sum of £7,106 the aggregate of excesses on various items which he referred to.—Mr. H. Seymour supported the amendment, reminding the committee that if they determined to confine the vote to the same amount as last year, no harm could be done, as the department had now in hand a balance of £22,000. With the views of the government upon the subject of education expressed this year, he considered that it was most inconsistent on their part to ask the committee to increase the expenditure under this vote. He doubted very much the expediency of the expenditure upon the photographic department.—Mr. A. Smith concurred in the complaint of the amount of the vote. He thought all the government ought to do with regard to science was to purchase collections and place them in museums.—Mr. Black thought the state was taking upon it that which ought to be done by parents of the higher ranks themselves in the education of their children. He was, therefore, prepared to vote against the sum for science and art.—Mr. Blackburn also opposed the vote.—Mr. Lowe said it had been the pleasure of the house to found this department of science and art, and the only question was whether its object had been answered. He fully believed it had been. Let it be asked where the designs of Copeland and Minton originated? Where the designs of terra cotta at the Horticultural Gardens? The design after Luca della Robbia? Why, in the designs of the students of the art schools. Where did the students at the Royal Academy first learn the principles of art? In the schools of the Science and Art Department. It was complained that this vote was increasing. That was the very merit of it. If the principle were a wrong one, let it be altered. But, so long as they adhered to the rule laid down, there was a necessary increase, especially in the provisions for the circulation among the country schools of examples and diagrams of art, and the expenses of the carriage and package of those articles in the preparation of photographic apparatus. With regard to the latter vote, he might observe that they had given up distributing positive photographs; they now sent negatives only. The increased establishments necessarily involved a large outlay for the officers, keepers, assistants, and clerks of the various collections. The picture gallery which had been erected had formed a model for that in the Exhibition, which he was sure they all admired.—Lord H. Lennox said that the discussion had proved that all those institutions which were supported by public money should be represented by a responsible minister. He looked upon the South Kensington Museum as a national institution, which well deserved all the support it had received. To it belonged the credit of originating a system of circulating copies of works of art throughout the country, thus rendering the collection purchased by the public not merely a metropolitan but a national collection.—After a few words from Colonel Sykes and Mr. Ayrton, Mr. Dillwyn replied, and said it was his intention to reduce the gross vote by £7,106.—The committee divided. For the reduction of the vote, 48. Against it, 111. The vote was then agreed to.

THE MIDDLE LEVEL CATASTROPHE.

THE destruction of the sluice and bridge connected with the Middle Level outfall, which cost £30,000 for construction, has been attended with fearful results, including the inundation of a thousand acres of land, and a considerable destruction of property. The entire drainage of a vast portion of the fens between Lynn and Peterborough depends upon this cut, which has been regarded as quite a feat in drainage, and it empties itself into the Ouzé about three miles above Lynn. On the 4th inst. the bridge and sluice were entirely destroyed (it is supposed through being made on a smudgy foundation) and a house or two engulfed. Since that time the most strenuous exertions have been put forth to construct a dam for the purpose of keeping out the tidal waters, but all has failed, though between twenty and thirty barges filled with sand have been sunk (only to be washed away as if they were toys), and about 20,000 sand bags have been thrown into the river. The spring tides have, therefore, rushed up the cut with unbounded velocity and power, throwing down bridges, forcing huge breaches in the banks, and inundating vast tracts of land. On Monday afternoon last the tide washed a barge from her mooring, capsized her, drove her against St. Peter's Bridge, and dashed it to shivers. During the first tide on Monday two breaches were made in the bank on the north-west side of the cut, about a mile apart. One of these was successfully stopped, but the other spread, and when we were there it was not less than fifty yards wide, and the water was rushing through with a sound like "the shout of a mighty cataract." The sight here is awfully grand; as far as the eye can reach is one vast body of water. Houses were submerged eight or ten feet, and a number of stacks were seen floating about. The line to Wisbeach from Lynn was beneath water for nearly a mile, and the trains were unable to run; the telegraph posts were washed away, and a stack of straw floated on to the railway lines and there rested. It was computed that there was, or would be, in a few hours, not less than 7,000 acres of some of the most productive land in England beneath the water, and it is feared that by Friday (to-day, which will be the highest tide), not less than 150,000 acres of land will be inundated. The destruction of all this property is frightful to contemplate, and ruin is staring in the face a great many

of the tenant farmers, as their countenances testify. We believe there is no expectation of being able to construct the dam till the neap tides. The cost of repairs which are rendered necessary, apart from the loss of property by the flood, it is supposed will not be much less than £100,000. The works are being vigorously prosecuted by about 500 men under Mr. Leather, contractor. The following engineers have inspected the damage:—Sir John Rennie, C.E.; Mr. Hawkshaw, C.E.; Mr. Fowler, C.E.; and Mr. Smith, C.E. Magdalen Fen, and a portion of Broad Fen and Marshland Fen, are under water now.

ON THE LIFE OF WELBY PUGIN.*

IT is an evident fact, but scarcely a truism, that any man who in these days would be a reformer in art must bring to the effort an extraordinary power of mind; and it seems to me that this power may be spoken of as of three kinds—the power of logic, the power of design, the power of enthusiasm; muscular intellect, magical imagination, electric passion; the head of the man, his hand, his heart. For the sake of illustration let me cite, as men whose fame is familiar to us, of our own day, and of our own province, Ruskin, Barry, Pugin. Ruskin, the subtle thinker, the exquisite poet, not without the ability of design—far from it; not without fervid zeal—far, indeed, from that; but, beyond all, the keen critic, stern teacher of the abstract. Barry, the graceful master of the pencil; the clear-headed, nimble-fingered, unimpassioned worker, working steadily in silence, and winning the day, without a word of philosophy, without a flutter of emotion. Pugin, the visionary dreamer, a man of most laborious hand, of refined and fertile fancy, of solid intellectual strength; but a wrestler wrestling fitfully in heat and rage, and losing the day—the more the pity—his philosophy in tatters, and his passion a wreck. And if you require me to suggest who shall be called the greatest of the three, I must ask Barry and Pugin to divide my suffrage—the one the sailer with the stream, the other the sailer against the stream. It is no disparagement to the sailer *above* the stream if, in the judgment of practical minds, he must here give place to practical men.

I cannot, perhaps, set forth my views of Pugin in a single sentence better than this. He was a genuine reformer of art; no mean office. He combined in his own person all the three species of reforming energy;—no usual thing; and he combined them in no usual force. Passion of the most passionate on earth reigned within him supreme. His artistic ability was of the highest order of his day—the very highest. As for logical skill,—even of this he had enough for his mission, and, what is more singular, he had not too much.

He died but ten years ago; he lived but forty years. To some of us, when we look back reflectively, it would almost seem as if he had died a century since, and lived a century: so much seed did he sow; so much fruit has it produced.

I have thus, I think, made sufficiently clear my purpose for to-night. I am to speak of Welby Pugin, not as an odd fish, not as a crazy fanatic, not as a lost and wasted light, not as a defeated foe; but as a giant in his day, of whose stature the vocation which we represent may fairly and for many a year be proud: a man of genius—of such strange genius as to appear rather the ideal of some old romance than the living compeer of yesterday.

The life of Welby Pugin was of three chapters: his youth, his manhood, his eclipse. It will be interesting to make one chapter more, that we may understand his origin—the origin, that is to say, of his career—that which brought about his mission, and brought him forward to meet it. To sketch these four chapters of the history of the art-reformer can scarcely fail to prove instructive and stimulative to earnest minds. On the other hand, to follow the journey of the man—to mark his uneasy footsteps, his persistent but fallacious purpose, his ultimate disappointment and despair—may encourage most of us to be well pleased that we are not men of genius.

I. THE CHAPTER OF ORIGIN.

Welby Pugin, born in 1812, had begun by 1827 to be an acknowledged artist. The first question, therefore, is this,—What was the state of things into which in 1827 this destined reformer came? The second question follows,—What was he, how prepared, who came as he did into this state of things to be a reformer?

At the close of the last century, the condition of English architecture was this. The practice of the Classic style had degenerated into a certain imbecile frippery that cannot be denied, and need not be described—more tatters of Cinque-centist design patched together in lath and plaster, casing and cradling, hollow iron, and sanded wood. The practice of a certain Mediæval style had recently come in as a new fashion, and upon the self-same easy principles. Horace Walpole's Strawberry Hill, Batty Langley's fine orders of Gothic architecture, James Wyatt's ecclesiastical restorations, and the Carlton House conservatory "in imitation of a cathedral," are fair samples of the works which were with difficulty accomplished, and with unanimity admired: the same imbecile frippery, the same tatters of design tacked together, in the same lath and plaster, casing and cradling, hollow iron, and sanded wood.

During the first quarter of the new century, matters improved to some extent. The close of the war set Englishmen all upon their travels; and the popularity of the pure Greek school, which had been acquiring influence gradually for sixty years, chiefly under Stuart and Revett, was raised to the utmost by the exertions of many well-known and esteemed writers, some of whom are still with us in honourable age. At the same time, in Gothic, John Britton felt emboldened to commence his celebrated illustrations of the English Cathedrals (in 1816); following the issue of his "Antiquities," begun in 1806, which followed again the publication of Carter's "Delineations," commenced in 1795. Nevertheless, in both styles, although the delineation of ancient examples, and the art of imitating them, consequently, in new designs, was vastly improving, it must not be supposed that the throne of the counterfeit had in any material degree been shaken. In metropolitan buildings, whilst Doric porticos of painted composita hid flimsy fronts of no one knew what; whilst neat baronial dwellings in the country affected to keep the villages in awe by sham cannon peeping out of embrasures of wood.

In these circumstances there came into some note in London the elder Pugin. He was a French refugee; and had been for many years employed as an office draughtsman by Mr. Nash, the then great king of all this composita architecture, when at length, being about the age of fifty, he married, and in course of a little time established himself in independent business as a professed architectural

author and designer, as we may call it, to the trade, with an office and half a dozen pupils—ruled by his lady with a rod of iron.

The taste of the elder Pugin was altogether Gothic; and his first publication, which appeared in 1821, was entitled "Specimens of Gothic Architecture,"—a work even yet well known. Britton's "Antiquities" had been before the public for a good many years; and his "Cathedrals" had been for five years in course of publication. Pugin may be said, therefore, to have merely followed the lead of others; but his engravings were so good and serviceable, that his work had a decided success, and his name became well known. In 1826 he published another similar work, on the "Antiquities of Normandy." Britton being here associated with him, success still attended his efforts; and he afterwards published other similar works. But we have now arrived at the period when his son, the proper subject of this sketch, began to attract attention, as himself an artist of note, in 1827, as has been said, at the age of fifteen.

Meanwhile, the Eclectic school of practice had come fully into public authority, and Greek and Gothic were recognised as the two great sister styles of architecture, which never could become rivals. To remind you of the buildings which were being erected at or about that time, I may mention Wyatville's Windsor Castle, Soane's Bank of England, Wilkin's University College, Smirke's Post Office; Mr. Cockerell's earlier works, such as St. George's Chapel; Mr. Tite's Scotch Church; Mr. Poynter's St. Katherine's, Regent's Park; Nash's Haggerstone Church, and Barry's churches at Brighton and the North of London.

The condition of architecture at the time of Welby Pugin's youth will thus be pretty clearly understood. The state of stupor of twenty years before had so far changed, that leading practitioners were displaying considerable refinement of design, chiefly in Greek, partly in Gothic; and, although it must not be disguised that inferior men were daily exhibiting all the imbecility of style and imposture of construction which had characterised the preceding age, yet the art, as a whole, was manifestly coming towards that stage of amendment when reform step in.

The train of circumstances which had produced the character of young Welby Pugin may also be tolerably clear. In the best Gothic school in London, an only son of the clever, earnest, and hardworking master, and the equally clever and most indomitable mistress, had grown up clever, studious, and indomitable, to nearly man's estate. He had been clever from the cradle; from early boyhood he had been a draughtsman as if by intuition; and it may as well be at once confessed that it was very early seen that he was to be a wilful, wayward, passionate, and indeed eccentric man. This was precisely the person to become a reformer.

Of the other reformer of the day it is not within our present province to say much; but, to give due effect to the mission of Pugin, we must not forget that Barry was his contemporary. For the reform of architecture was destined to take not one direction only, but two; and up to the present moment, great as have been the results of Pugin's leadership in Gothic, those of Barry's leadership in Italian have also been very great. Of these two famous men, Barry carried a funeral light in St. Augustine's when he who was so strangely his comrade, and never his rival, was laid sadly in an almost neglected grave; and when we buried Barry in honour beneath the ancestral roof of Westminster, bigot as Pugin was, if he had lived he would have been there.

II. THE CHAPTER OF YOUTH.

At fifteen, old Pugin's skilful and enthusiastic boy, finding the regular work of his father's office a bore, was picked up by a fashionable silversmith, to be turned into money in the designing of fashionable Gothic plate. I always pity a manufacturer's artist. I picture the ready fancy and the skilful hand continually kept under a cloud by the decrees of the counting-house. Before long it was worth while—that is to say—for Messrs. Rundell & Bridge to boast of this and that goblet and dish as the design of young Mr. Pugin; but I dare say there was otherwise little, if any, departure from the time-honoured custom whereby the individuality of the artist is swallowed up in "the well-known reputation of the firm." No doubt there are art-manufacturers listening to me now; they are honourably esteemed and encouraged here, and long may it be so; let me be excused by them for what I now say; but there is a maxim which I would fain urge upon them as a manly principle—and a principle that will pay, I am sure, however improbably, because it is a manly one, and ought to pay. Pity your poor artist, and give him at least the credit of his work; boast of his name, if you please, but do not boast of his work and call it yours; take the money, but let him have the fame.

Pugin was soon picked up again, however. This time it was an upholsterer who got hold of him; and his work was to design Gothic furniture for Windsor Castle. Out of this engagement nothing particular arose, except, quite accidentally, his first grand whim. He was of the age of fifteen, remember, for it was only June 1827.

Whims are the incentive efforts of genius. There are some people who never get beyond this whimsical stage; perhaps they are to be geniuses in another world; but there are others who get through it early. Pugin was one of these last; he went quickly over the ground; but the whimsicality was stupendous. So now comes his first.

At the upholsterer's he met the son of a scene-painter of Covent Garden theatre. He had never been in a theatre in his life; the only theatre to which his Puritanical mother took him was the chapel of the fanatical Edward Irving, the apostle of the Unknown Tongues. "Terribly long sermons," he would say; an hour and a half at a time, and he couldn't understand a word of it. Now, however, he went behind the scenes at Covent Garden, and at once understood all about that. Gothic scenery was fashionable. He made a rush at the subject: studied the processes of painting and machinery, and for some time, as a mere boy, was the great Gothic designer of such things. Not content with this, he cut to pieces the attic story of his old father's house in Great Russell Street, formed it into a theatre of his own, and there revolved in designing (to use the words of Mr. Ferrey) "the most exquisite scenery, with fountains, tricks, traps, drop-scenes, wings, soffites, hilly scenes, flats, open flats, and every magic change of which stage mechanism is capable." Suffice it to say that he rode his hobby very hard over this pleasant landscape for about two years without drawing rein; then suddenly throwing it on its haunches, with the unceremonious kick of genius, he dismissed it for another whim.

His new passion was the sea. Whether the ocean is a Gothic element in these days, when everything is matter of opinion, might be a question for debate; but Pugin loved it to his dying day. "There is nothing worth living for," he would say, "but Gothic architecture and a boat." A sort of Garibaldi

* Read by Professor Kerr at the Architectural Exhibition, 13th May.

in art, he took the command of a smack, and then of a schooner, and went into trade. At length old Neptune—perceiving, perhaps, that one more foolish young rover was ripe for a lesson—cast him lamentably upon Scottish rocks, and left him half-drowned and half-starved to seek a friend where he might. He made his melancholy way to Edinburgh; went courageously to one of the principal architects, and introduced himself and his misadventure. Gillespie Graham clothed and fed his erratic professional brother joyfully, put a purse in his pocket, and sent him home to London, with a dose of sound Caledonian counsel, and a keepsake whereby to remember it—the good man's silver compasses. All this produced satisfactory results. On his arrival in London the repentant sailor took earnestly to art. Six years afterwards one of the most striking designs for the Palace of Westminster (some said it was the best of all) was Pugin's work in Gillespie Graham's name. In Herbert's portrait, after many years more, Pugin holds in his hands the venerable silver compasses.

The date of this not unfortunate shipwreck was 1830; and the ruined commander had reached the age of eighteen. He now took to art, I have said; he took to it, however, still whimsically.

The next was an architectural whim,—the establishment of a factory for Gothic carving. He took large premises at Covent Garden; engaged carvers, and undertook the supply of ornamental work for architects, in all quarters of the country; making, of course, his own designs of detail, as he alone, even at eighteen, could make them. It seems a hard thing to say, but we are scarcely surprised to be told, that within a few months the speculation proved a total failure.

The idea seems ridiculously natural, but one might fairly say that, amongst all these whims, it is a wonder he had not married. Well, he had married. "I had married," he would tell you, "twice before I had shaved once." It was a short courtship; the young wife came from the scene-painting connection; she was taken home to old Mr. Pugin's house in Great Russell Street; the parents much disapproved the match, but they did not dare to thwart their wayward son. The poor girl, however, proved an affectionate companion; and when she died, within the year, the boy-husband's heart seemed broken. The desolate youth, in his infinite depression, looked back upon his past life. To smile at his hyperbole would be sacrilege. He was not twenty: he looked back over six years: there had been crowded into those six years—even his stern mother said so—"a whole lifetime of woe." Whim after whim: he resolved to seek out for her burial some pleasant place after the pleasantness of his own old fancy. He took her to Christchurch, in Hampshire, because it was a pleasant place. Three weeks after her death he laid her in the vault, with unusual ceremonial, at eight o'clock at night. Perhaps it was a comfort, perhaps an embarrassment: she had left behind her the sad legacy of a new-born daughter.

Whim after whim; he was not yet twenty, and we lose their reckoning. He now resolved to build himself a model house. It would seem that he had cherished this whim for some time, young as he was. He would build in the Mediæval manner, of course: not in the manner which Nash and Wyatt followed, but in what that manner ought to be. He fixed upon a piece of ground near Christchurch, where he had so lately buried his young wife. All was speedily in readiness except one thing—the money.

We all know how inflexible a thing this is; how the money will always have its own way; how it is of no use to coerce it, or to coax it, or to propose any sort of compromise to it; how nothing will weigh with it for a moment but mean mechanical considerations, vulgar reckonings, callous unimaginative arithmetic. It has been the great enemy of poetic and impassioned minds from Tubal Cain till now, and has behaved towards them in a shameful and remorseless way. Young Pugin was positively stopped short on the very threshold of his project by this ill-conditioned adversary. His indignation and disgust may be more readily imagined, as the phrase goes, than described. An application was made to the old gentleman in Great Russell Street to become surety for his son. The drawings, no doubt, were ready; the cost counted; the building staked out; but old Mr. Pugin was seventy. He declined the investment. And, what is more discreditable still to human nature, there is not a soul in this room who does not consider him to have done quite right.

However, in the same year, 1832, old Mr. Pugin died, in December; and early in the year following died his widow. All that we have to remark about them here is, that they seem to have been buried quietly and without a whim, at Islington, under the control of Mrs. Pugin's sister, who had long dwelt there. Mrs. Pugin, in her youth, had been the belle of Islington, although her beauty was of the severe order. An eccentric gentleman once said to her, "Madam, how exceedingly like you are—to the devil!" And she accepted the remark as a compliment.

III. THE CHAPTER OF MANHOOD.

The year 1833 saw Welby Pugin, at the age of 21, an orphan, a widower, a father; one who had seen ups and downs in the world; one who had had his projects, and had some of them still.

He was a slovenly, ordinary-looking person; impatient, dogmatic, and whimsical; sailor-like in dress and habits, with a redeeming dislike, however, of beer and tobacco, and a still more redeeming brightness of enthusiasm in his eye. In all his ups and downs his memory had never ceased to accumulate its stores of Gothic art, and his rare right hand had not forgot its cunning. He now began in earnest the battle of life. It will be seen that his ardour, although all unabated, and still like no one else's ardour, was now the steady purpose of manhood, and no longer the caprice of a boy.

He at once married again. The new connection was still somewhat hastily and enthusiastically formed; but the lady was one who proved worthy of his respect, and competent to influence him for good throughout the best part of his life.

He went to reside at Salisbury, and became as nearly as possible a man of business,—a practising architect. At first he passed a good deal of his time in Gothic sketching and study, making a tour, indeed, of the English cathedrals for this purpose. He everywhere found restorations, repairs, re-arrangements, in the manner which we described a little time ago. He disapproved of them. He expressed himself vehemently about them. "I rushed to the cathedral; but, horror! dismay! the villain Wyatt had been there! All that is vile, cunning, and rascally is included in the term Wyatt!" Again,—*"The church is in dreadful repair—fall it must; and all that is to be hoped is, that in its fall it may annihilate those whose duty it was to have restored it."* Again,—*"The church was improved and beautified about thirty years ago by the late Mr. Wyatt. Yes—this monster of architectural depravity, this pest of cathedral architecture,*

has been here,—need I say more? The man, I am sorry to say, who executes the repairs of the building was a pupil of the wretch himself, and has imbibed all the vicious propensities of his accursed tutor." We can only say, that this was, at the worst, very sound criticism, and at the best very rough language. Sound criticism and rough language were to be his through life.

Soon after his settlement at Salisbury, a relative died, bequeathing him a considerable legacy. What was he to do now? There is a logical certainty about some people's most odd doings—a method in their madness—which enables us to guess to a nicety what they are to do next. Pugin's aunt left him money, and the question is, What was he to do with it? Money?—why, money was the identical thing which stopped him short in the matter of his house. He would build his house with it, of course! He selected a suitable site in the neighbourhood of Salisbury, bought it, and forthwith erected his long-contemplated Gothic dwelling. It was what may be called a plain fifteenth-century square brick house, of three stories, with a high-pitched and crested-hip roof; and there were two attached turrets,—one constituting a small porch below, and a belfry at the summit.

The elevations were altogether unsymmetrical, and, I think, more in the simple, ungarished, and unaffected spirit of Mediæval domestic work than any other modern design of the kind I know. The high road in front of the site being some feet above the ground within, and the lowermost story being therefore formed as a basement of kitchen offices, the entrance-door was reached on the first-floor level by the not inappropriate but needless means of a small draw-bridge. The rooms are generally described as having been quaint and uncomfortable; but there was nothing in it to mark as yet the peculiar mission of the man, except, perhaps, the domestic chapel, and the hagiocope by which the occupants of the bedchamber story might listen to the service at early morning.

The plan generally is pronounced to have been more modern in its principles than ancient. The decoration, fittings, and furniture, were of course in Mediæval style, the design of the owner's hand.

Meanwhile, he had brought out several books illustrative of Gothic art. During the years 1835 and 1836, he published no less than four volumes of designs, in so many various departments of his favourite style, namely: first, his "Gothic Furniture," and succeeding this, his "Iron Work," "Gold and Silver Work," and "Ancient Timber Work." Although the knowledge of what we call Mediæval principles has vastly progressed since that time, no one who examines those early works can wonder that they attracted great attention, became the accepted authorities on their subjects, and established the reputation of their author as the leader of the new-fashioned Gothic style of ornamental art.

(To be concluded in our next Number.)

PROVINCIAL NEWS.

THE SCARBOROUGH PIER AND IMPROVEMENT COMPANY.—The proposed public works in Scarborough are likely to be speedily commenced, as they have received the support of a public meeting in that town. Mr. T. Page, C. E., is the engineer employed, and the consulting manager is Mr. W. Northhouse.

THE THEATRE AT BATH.—The recent destruction of this elegant building by fire was a matter of regret to all the inhabitants, and sympathy has been expressed generally for the great loss personally sustained by Mr. Clute. A thorough-going agitation has produced a meeting of the most influential citizens, and it was resolved at that meeting to re-erect the Bath theatre. This will be effected through a limited liability company, with a capital of £12,000. We understand the design for the new structure will somewhat alter and increase the accommodation, but the general arrangements of the stage the architect (Mr. C. E. Davis) leaves to be restored almost according to the design from which the former theatre was built.

PAINTED WINDOWS.—We understand that the Revs. A. and F. Sutton have just presented their fifteenth and sixteenth painted windows to Lincoln Cathedral, and also the east window to St. Botolph's Church in that city.—The whole of the memorial window to Bishop Sharpe of Doncaster is now on view in the International Exhibition. The position is not altogether a favourable one, still it seems to us that the window, as a whole, is not quite up to the mark, either as to design or colouring. Each compartment, when viewed separately, does not leave this general impression. It may be, however, that when the window is fixed in its intended position, this thinness of aspect may cease to present itself.

THE GAS WORKS AT DONCASTER.—Mr. Fairbank, of Scarborough, has completed the large gasholder at the works here. The cost is about £5,000. The holder is of wrought iron plates, and in its construction 170 tons of iron have been used, and 106 tons have been worked up in the columns supporting the balances, the pedestals, &c. The diameter of the holder is 115 ft., its height 20 ft. 6 in.; so that at a rough calculation it is capable of containing 225,000 feet of gas. The excavation for the holder tank was to the extent of nearly 7,000 cubic yards.

DOVER WATER WORKS.—It has been settled, we believe, by the Town Council of Dover, to lay out £8,500 on the improvement of the water-works. The cost of the present works was nearly £25,000.

PUBLIC ROOMS AT CAMBRIDGE.—These fine buildings, from designs by Messrs. Peck and Stevens of Maidstone, have just been opened. They consist of an assembly-room, free library, suites of rooms for the School of Arts, Town Clerk's office, &c. The assembly-room is of an Italian design. The side walls are broken up by means of pilasters and surface panels, surmounted by cornices and balustrades, upon which line the windows are placed, the pilasters being covered up, and finished with cornices and ornamental foliage. From hence the walls unite with the ceiling by means of a cove, with projections from pilasters continued on ceiling, the soffits of which are filled with ornamental foliage, perforated for ventilation. The end of the room is circular, on the same plan and with the same description of decoration as that of the side-walls. Over the entrance to the room is a small gallery. The other parts of the structure are in keeping with the main feature.

ARCHITECTURAL EXHIBITION.—On Tuesday evening a lecture was delivered at the Architectural Exhibition, Conduit Street, Regent Street, before a numerous audience, by Professor Kerr, "On the Character and Career of the late A. W. Pugin." The chair was occupied by Mr. E. B. Lamb, and at the close of the meeting a vote of thanks to the lecturer was carried by acclamation. The next lecture will be delivered on Tuesday next, by Mr. W. Burgess, on "Pagan Architecture."

THE ARCHITECTURAL MUSEUM.—A meeting will be held at the Architectural Museum, South Kensington, on Tuesday next, when a lecture will be delivered "On Ecclesiastical Architecture in Georgia and Armenia," by the Rev. George Williams, B.D.

CRYSTAL PALACE.—The great flower show of the season will be held on Saturday, May the 24th. Taking place on the Queen's birth-day, a day which this year unhappily will be unattended with the usual military displays, drawing-room, or other rejoicings, a large number of distinguished and official personages will have leisure to attend this, one of the most attractive displays of the season. Additional interest is excited on this occasion from the announcement that the great roof over the Handel orchestra, which has been so many months in preparation for the festival in June next, will be completed before the day of the flower show.

TENDERS.

ALTERATIONS, HACKNEY ROAD.

For certain alterations to "Pritchard's Arms," Hackney Road, for Mr. Bobotham; Mr. W. J. Green, architect.

Patrick and Sons.....	£970 0 0	Langtree.....	£604 0 0
Longmead.....	750 0 0	Rankin (accepted).....	530 0 0

COVERED MARKET, DARLINGTON.

Twelve tenders have been made for the erection of the projected covered market, and though submitted to the local Board of Health, we believe no decision has yet been come to in the matter. No. 1 tender was for £10,374; No. 2, £10,113; No. 3, £9,303; No. 4, £8,871; No. 5, £8,815; No. 6, £8,621; No. 7, £8,574; No. 8, £8,501; No. 9, £8,411; No. 10, £8,402; No. 11, £7,815; No. 12, £7,759.

CHAPEL, OLD KENT ROAD.

For additions and alterations to Marlborough Chapel, Old Kent Road.

Thompson.....	£1,733 0 0	Calls and Co.....	£1,234 0 0
Lawrence and Sons.....	1,532 0 0	Hill and Son.....	1,777 0 0
Perry and Dudson.....	1,494 0 0	Dove.....	1,364 0 0
Wills.....	1,479 0 0	Sawyer.....	1,350 0 0
Downs.....	1,456 0 0	Mann.....	1,300 0 0
Child and Son.....	1,399 0 0	Sharplington and Cole.....	1,297 0 0
Calman.....	1,394 0 0		

BUSINESS PREMISES, OXFORD STREET.

For erecting new premises—Nos. 65 and 67 Oxford Street—for Messrs. Hyam; Mr. H. Jones, architect. (Quantities by Mr. Reddall and Wright and Gould.)

Holland and Hannen.....	£10,329 0 0	L. Anson.....	£9,730 0 0
Lucas Brothers.....	10,240 0 0	Brass.....	9,393 0 0
Myers and Son.....	10,210 0 0	Pritchard.....	9,080 0 0
Lawrence and Sons.....	9,970 0 0		

RIVER WORKS ON THE CAM.

For repairing sluice at Baitsbite, and providing new doors for the pen and bridges over floodgates and overfall.

Thadaye and Clayton.....	£525 0 0	R. Fyson, Soham (accepted).....	£475 0 0
Strickson, Hinxton.....	497 0 0		

CHAPEL, STUDLEY ROAD.

For the erection of a new Wesleyan Chapel in the Studley Road; Mr. W. W. Jenkins, architect. (Quantities by Messrs. Lansdown.)

Browne and Robinson.....	£3,598	Walker.....	£3,189
Wardle and Baker.....	3,390	Thompson.....	3,075
Stone.....	3,308	Chinnock (accepted).....	3,040

GRANARIES, WAPPING.

The following were received for two Granaries, Old Gravel Lane, Wapping; Mr. C. Alsop, architect. (Quantities supplied by Mr. F. G. Widdows.)

Dale.....	£2,953	Ennor.....	£2,489
Conder.....	2,540	Johnston.....	2,398

MALT OFFICE, LINCOLN.

Tenders for a new 45-quarter malt office, Lincoln, for Mr. Nesbitt. Mr. Goddard architect.

Jackson.....	£1,420 0 0	Fretwell.....	£1,223 0 0
Smith.....	1,347 0 0	Calvert (accepted).....	1,078 10 0
Kirk.....	1,332 0 0		

Tenders for three lodges at Hartsolme Hall, Lincoln, for Joseph Shuttleworth, Esq.

Yang.....	£1,185 0 0	Fox.....	£700 0 0
Reeve.....	745 0 0	Jackson (accepted).....	640 0 0

COMPETITIONS OPEN.

CATHEDRAL.

CORK.—Architects are invited to furnish designs for the erection of the cathedral of St. Finbar, Cork, at a cost not exceeding £15,000. A premium of £100 will be given for the best and most approved plan, and £50 for the second. Plans and designs to be sent to the hon. secretaries, Ven. the Archdeacon of Cork, Rev. J. N. Woodroffe, or T. M. Osborne, Esq., Cork, not later than the 1st August next. Further information and a plan of the site may be obtained on application to W. C. Bennett, Esq., notary public and Chapter clerk, 15 South-mall, Cork.

CHURCH.

LEAMINGTON.—Plans and estimates, in sections, are required for the completion of the parish church of Leamington. The nave, the chancel, and the north transept being already built, it is intended to proceed to erect the remaining portions of the work in sections. Architects are invited to send in plans and estimates, in sections, for erecting the south transept, the vestry, the lantern tower, and the bell tower; which it is intended to build in strict harmony with the architectural style of those portions of the church now erected. Increased accommodation in the church is most desirable. A premium of £20 will be given for the best set of plans and estimates in the opinion of the Committee, which must be sent, sealed and under motto, to Mr. G. Rogers, Newbold Street, Leamington, on or before the 21st June, of whom all further particulars may be obtained.

SCHOOL.

RADNOR.—Plans and specifications are required on or before the 1st June, for the Knighton National School, Radnorshire, comprising Boys' Girls' and Infants' Schools and Class-rooms, together with Residence for Master and Mistress. For information as to site and other particulars, apply to the Rev. J. R. Brown, Incumbent of Knighton.

LIBRARY AND READING ROOMS.

BIRMINGHAM.—The Free Libraries' Committee of the Council of the Borough require plans, sections, specifications, and estimates for the erection of a free reference library and reading-rooms, lending-library and news-rooms, and gallery of art, upon the piece of vacant land adjoining the Midland Institute Building, with an elevation uniform with the said building. Intending competitors are requested to send in their plans, specifications, and estimates, under cover, to Thomas Standbridge, Town clerk, Town clerk's office, Temple-street, endorsed "Plans for Free Reference Library Buildings," on or before the 10th June. Particulars of the accommodation required, and of the conditions of competition, together with a lithographed plan of the site, may be obtained on application.

MEMORIAL.

GLOUCESTER.—The committee appointed to carry out the Hooper Memorial, at Gloucester, invite sculptors to submit models of designs for the figure of Bishop Hooper, which is intended to be placed under the canopy of the monument just erected in the churchyard of St. Mary de Lode, Gloucester. The models or statuettes to be carved in stone, and to be one-quarter the real height (7 feet). The author of the best design, approved by the committee, will be appointed to execute the full-sized figure; and the sum of ten guineas will be awarded for the second-best design.

CONTRACTS OPEN.

CHURCHES, ETC.

SOMERSET.—For building a north aisle, and making additions to the east end of the parish church of Weston, near Bath. Drawings, &c., with Manners and Gill, Architects, 1 Fountain Buildings, Bath; to whom tenders endorsed "Tender for Works at Weston Church," on or before the 24th inst.

IRELAND.—For the erection of a new Catholic church, to be built at Kenmare. The parish priest will show the plans and specifications, and will receive tenders up to June 1.

WARWICKSHIRE.—For repairing and restoring the parish church of Long Compton, Warwickshire, near Chipping Norton. Plans at the Vicarage, Long Compton, to the 17th May inclusive; sealed tenders, directed to the Rev. H. Lauphler, Long Compton Vicarage, Shipston-on-Stour, on or before the 24th May.

STROUD.—For the several works required to be done in rebuilding the parish church of Stroud. Plans, &c., at the office of Mr. J. G. Bland, architect, Birmingham. Tenders to be delivered on the 20th May. Copies of drawings and specifications will also lie at Stroud for inspection, and may be seen on application to the architect.

ISLEHAM.—For the repair and restoration of Isleham parish church near Newmarket. Plans, &c., at the Vicarage, Isleham. Tenders to be delivered at the Rutland Arms, Newmarket, on the 20th May, at 12 A.M.

CHAPELS, ETC.

USK.—For the erection of a new chapel and vestries on the site of the present Congregational Chapel at Usk, Monmouthshire. Particulars from Messrs. W. G. Habersham and Pite, architects, 35 Bloomsbury Square, London; and Park Square, Newport, Monmouth; and Belvedere, Tredegarville, Cardiff.

MANCHESTER.—For the erection of a chapel and school room, in Booth Street East, Chorlton-upon-Medlock. Sealed tenders to the Rev. T. E. Evans, No. 108 Brunswick Street, Upper Brook Street, not later than the 24th inst. Plans, &c., with Mr. Herbert Jones, 6 Moreton Street, Strangeways.

SCHOOLS, ETC.

LANCASHIRE.—For the erection of the proposed new schools, vestries, &c., at Rawtenstall, Lancashire. Plans, &c., on application to Thomas Hoyle Whitehead, Esq., on and after the 12th May. Printed quantities will be supplied on application to the architect. Tenders to be delivered to Thomas Hoyle Whitehead, Esq., Rawtenstall, on or before the 21st May.

CEMETERY WORKS.

BIRKENHEAD.—For the erection of three chapels, Registrar's house, gate lodge, entrances and boundary walls, for the Cemetery at Flaybrook Hill, Birkenhead, &c. Plans and form of tender at the Commissioners' offices, 35 Hamilton Square, Birkenhead; and further particulars obtained of the architects, Messrs. Lucy and Littler, Tranmere, near Birkenhead. Tenders in sealed covers, endorsed, "Tenders for Cemetery Buildings," addressed to the Chairman of the Cemetery Committee, to be delivered at the Commissioners' offices on or before the 28th inst.

SALE.—For the erection of a fence wall, on the Sale burial ground, near Brooklands station, on the Altrincham railway. Particulars from Mr. William Wilson, architect, 23 John Dalton Street, Manchester. Tenders to the Chairman of the Burial Board, Sale, Cheshire, not later than the 20th inst.

SUSSEX.—For the erection of two chapels and sexton's lodge, and out offices connected with the Burial Board for the parish of Broadwater, in the county of Sussex, on land at Broadwater, intended to be used as a cemetery for the parish of Broadwater and town of Worthing, together with the boundary walls and other works connected therewith. Plans, &c., with Mr. W. Verrall, clerk to the Burial Board, Worthing. Sealed tenders, endorsed "To the Burial Board for the parish of Broadwater, Tender for Works," to be delivered at the clerk's office, 15 High Street, Worthing, before 5 o'clock on the 20th May.

ASYLUMS.

NORFOLK.—For the erection of male and female infectious wards at the Thorpe Asylum, Norfolk, and also for building four workmen's cottages on a piece of land adjoining it. Plans, &c., with R. M. Phipson, architect, County Surveyor, Norwich, to the 24th inst.; and painters willing to tender for painting the whole of the outside wood and iron-work at the said Asylum, may see the specification for it at the same offices. Tenders to F. J. Blake, Esq., Treasurer and Clerk to the Committee of Visitors, King-street, Norwich, on or before the 24th inst., enclosed separately in sealed envelopes, and endorsed "Tender for Infectious Wards," "Tender for Workmen's Cottages," and "Tender for Painting," as the case may be.

DUBLIN.—For erecting a new Asylum at Leeson Park for the Board of Governors of the Old Men's Asylum, according to the plans, &c., to be seen at the office of the architect, William G. Murray, 68 Lower Gardiner-street, Dublin. Tenders to be addressed to T. Collins, Hon. Sec., 25 Harcourt-street, and forwarded on or before the 20th May, endorsed "Tenders for Building."

WORKHOUSE.

HANTS.—For the works required to be done in making certain alterations in, and additions to the Alverstoke Workhouse. Plans, &c., at the Board-room of the workhouse on and after the 14th May, or at the office of Mr. Thomas Hellyer, Bouverie House, Ryde, Isle of Wight, architect, of whom every information may be obtained, and bills of quantities may be had.

INFIRMARY.

ISLE OF THANET.—For the erection of a new infirmary, fever wards, office buildings, a chapel, fence walls, &c., in connection with the present workhouse, situate at Minster, near Ramsgate, Thanet, Kent. Plans, &c., with Mr. Edwards, architect, 17, Hart-street, Bloomsbury, London, W.C., or at the Board-room of the workhouse, where lithographed copies of quantities may be obtained, price 10s. Tenders, sealed, to the Chairman of the Board of Guardians, by 5 p.m. May 21st.

VILLA.

HANTS.—For the erection of a villa residence at Botley, Hants. Plans, &c., at Mr. Harding's harness manufactory, Botley, on and after the 22nd inst. Tenders to the architect, Mr. John Colson, St. Swinith-street, Winchester, on or before the 5th June.

DWELLING HOUSES.

STAFFORD.—For the erection of five houses, at Forebridge, for Mr. John F. Bridgwood, Wolverhampton-road, Stafford. Drawings, &c., with Henry Ward, architect, Bank-passage, Stafford.

DUMFRIES.—For building an addition to the miller's house at Glenesslin Mill, Dumfries, for repairing and building new office houses there, and for repairs of considerable extent on the kiln and mill. Plans, &c., Sir William Brown, Bart., solicitor, Dumfries, to whom tenders by the 18th inst.

FARM BUILDINGS.

WILTS.—For a large farmhouse, homestead, &c., upon Bemerton Farm, near Salisbury. Tenders to Mr. Clarke, Corn Market House, Salisbury, or before the 19th May.

RESERVOIR.

BLACKBURN.—For the construction of a new reservoir, to be called the Fish Moor Reservoir, adjoining the Guide Reservoir, near Blackburn, for the Directors of the Blackburn Water-works. The work will consist principally of an embankment of 47 feet in height, containing about 340,000 cubic yards of material, with the masonry, stone beaching, and other work connected therewith. Plans, &c., at the office of the Water Company, Clayton-street, Blackburn; and at the office of Mr. Bateman, engineer, 9, St. James's-square, Manchester, and sealed tenders (a form of which may be had on application), endorsed "Tenders for Fish Moor Reservoir," must be sent in, addressed to "The Chairman of the Company," not later than the 5th June.

BRIDGES.

GATHEHOUSE.—For building a new bridge over the river Fleet, at Castramont, in the parish of Girthorn. Plans, &c., with Mr. Ewart, Bank of Scotland, Gathehouse, who will receive offers till the 50th May.

WORCESTER.—For the construction of a brick bridge and other work near Martley, Worcester-shire. Plans, &c., with Henry Rowe, County Surveyor, 17 Foregate Street, Worcester, where tenders, under seal, and properly endorsed, are to be delivered (free of cost) on or before the 24th.

POLICE STATIONS.

SIDMOUTH.—For the erection of a police station, &c., at Sidmouth, Devonshire. Plans, &c., with Henry Ford, Clerk of the Peace, Castle of Exeter, and at the office of Messrs. Radford and Williams, Clerks to the Justices, Sidmouth. Sealed tenders, endorsed "Tender for Sidmouth Police Station," to be sent to Mr. Ford, on or before the 3rd June.

ROAD-MAKING.

NOTTS.—For the execution of sewerage and road-making on the North Gate and Beacorn Hill Estates, Newark-upon-Trent, Nottinghamshire. The following rough quantities are here stated, in order to indicate approximately the extent of the proposed works; but parties tendering will have to take out for themselves the quantities necessary for that purpose. On the North-Gate Estate: 30-feet roads, including 6-feet footpath on both sides, 775 feet run; 6-feet footpaths, extra, 410 feet run; stone kerbing to footpaths, 1,550 feet run; paved and pitched channelling outside of footpaths, 1,525 feet run; 15-inch pipe sewer, 35 feet run; 12-inch ditto, 456 feet run; 9-inch ditto, 680 feet run; gully-cesspools, with 6-inch pipe overflows to sewers, 6 in number. On the Beacorn-Hill Estate: 45-feet road, including 7½-feet footpath on both sides, 516 feet run; 7½-feet footpaths, extra, 520 feet run; stone kerbing to footpaths, 1,550 feet run; paved and pitched channelling outside of footpaths, 1,035 feet run; 15-inch pipe sewer, 114 feet run; 12-inch ditto, 380 feet run; 9-inch ditto, 440 feet run; gully-cesspools, with 6-inch pipe overflows to sewers, 4 in number. Plans, &c., at the offices of the Conservative Land Society's surveyor, Mr. James Wyllson, 33, Norfolk-street, Strand, London, W.C.; also at the offices of Mr. Alfred Allen, Market-place, Newark-upon-Trent. Tenders on or before May 24, addressed to the surveyor, as above, and endorsed "Tender for Works at Newark."

TODMORGEN.—For forming the footpaths from Gauxholme to Winterbitch-bridge, on the Rochdale-road; from Gandy-bridge to Barewice-mill, on the Burnley-road; and from Stanfield-bridge to Lob-mill, on the Halifax-road, in all about 5,700 lineal yards, or 11,400 superficial yards. Also tenders for about 120 lamp-posts, lamps, &c., complete, to be fixed within the before-mentioned districts. Specifications, &c., may be seen, and any further information obtained, at the office of the Local Board, Todmorden, where tenders must be delivered by 2 p.m. on the 22nd inst., addressed "To the Paving and Lighting Committee."

RAILWAY WORK.

INVERNESS AND PERTH JUNCTION RAILWAY.—For the construction of the two remaining sections of the line, viz.:—The Kingussie contract, extending from Kinrara Post-office to the south side of the river Spey, measuring about 13 miles or thereby, comprising about nineteen small bridges and culverts, with a timber viaduct across the Spey. The excavations and embankments consist of about 470,000 cubic yards. The Dalwhinnie contract extends from the south side of the Spey to the boundary of the county of Perth, measuring 15 miles or thereby, and consists of thirty-two small bridges and culverts, and about 430,000 cubic yards excavations and embankments. The rails, chairs, sleepers, spikes, fish-plates, and bolts will be supplied by the Railway Company. Drawings, &c., at the office of Joseph Mitchell, Esq., C.E., Inverness, from whom, or from the assistant-engineer on the line, duplicate schedules may be obtained, at 2s. 2s. each. The line is staked out at distances of every 100 feet, according to the working sections. The deepest cuttings are also plotted to ascertain the nature of the materials in the excavations. An assistant-engineer will be at the County March, near Dalnacardoch, on the 20th May, at 10 o'clock a.m., to accompany the contractors over the Dalwhinnie contract; and at Spey-bridge, near Kingussie, on the 21st, to go over the Kingussie contract, and to point out the works and sites of the bridges. The draft contract proposed to be entered into will be seen with the assistant-engineer, or at Mr. Mitchell's office. Sealed tenders, addressed to the secretary, and marked "Tender for Inverness and Perth Junction Railway Works," "Dalwhinnie" or "Kingussie Contract," as the case may be, must be lodged at his office, on the 28th May, at 4 o'clock p.m.

SEWERAGE, ETC.

NORWICH.—For constructing and repairing sewers, drains, gullies, &c., within the corporate district of the Norwich Board of Health, for the term of three years, from the 24th June next. Specification at the surveyor's office, 24 Castle Meadow, where every information may be obtained. Tenders addressed to H. B. Miller, Clerk to the said Board, and endorsed "Tender for Repairs to Sewers, &c.," on or before the 20th May.

SCHOOLS.

BEOS.—For the erection of a schoolroom and class rooms at Howard Chapel, Bedford. Plans, &c., with Mr. Usher, 30 Mill-street. Tenders by 10 a.m. May 22.

HOSPITAL.

MAIDSTONE.—For the works at the West Kent General Hospital, Maidstone (previously advertised.) Tenders to be delivered at the Hospital before 10 a.m., May 20. (Mr. H. Blandford, of Maidstone, is the architect.)

ABRIDGED SPECIFICATIONS OF PATENTS FOR INVENTIONS.

From the "MECHANICS' MAGAZINE," May 9.

2602. B. TAYLOR. An improvement or improvements in the manufacture of certain descriptions of brace webs. Dated Oct. 18, 1861. Here the inventor proposes to employ woollen or worsted webbing with indiarubber, thereby obtaining more brilliant dyes in wool than in cotton. *Patent abandoned.*

2611. T. FEARLEY. Improvements in steam hammers. Dated Oct. 19, 1861. The patentee forms the steam cylinder annular, in order that the ram may pass through the inner or central part of such cylinder, and thereby have increased guiding surface in its motion, as also to reduce the height of it, and he forms the piston annular, with rods passing through the head of the cylinder to a cross head affixed to or formed upon the ram, or through the bottom of the cylinder direct to the hammer above the head. He also forms the hammer to surround the cylinder, the piston rod being keyed into the hammer just above the head. In this case the cylinder is fixed to the upper part of the framing, and the framing below is bored to receive and guide the hammer in its motion, whilst the inside of the hammer is bored true to slide on the cylinder. He also gives motion to the valves of steam hammers by means of a spiral groove or feather, cut or formed in the hammer, acting upon a pin or stud in connection with the valve or valves. *Patent completed.*

2613. J. MARSHALL. The collection, concentration, and transmission of sound, so as to facilitate the hearing thereof. Dated Oct. 19, 1861. The patentee claims the construction of apparatuses for the collection, concentration, and transmission of sound, in which a combination of reflecting surfaces is employed, which are so formed, and are adjusted in such relative positions, that the rays of sound are received on one or more of these reflecting surfaces, and are thence reflected in a concentrated manner on to one or more other reflecting surfaces, by which they are again reflected in a parallel or nearly parallel manner into a conducting tube, or into several conducting tubes, which convey or convey them to the ear. *Patent completed.*

2614. J. BOURNE and E. KINN. Improved machinery for the manufacture of tubes and cylinders, which is also applicable to other useful purposes. Dated Oct. 19, 1861. To accomplish the object of the invention the patentees construct improved machinery in the following manner:—Any given number of rolls or cylinders having slightly concaved peripheries and bevelled edges are mounted in a suitable frame-work; the said rolls or cylinders, when definitely fixed in a working position, are relatively angular, the effect of which may be stated thus: when the metal or alloys of metal designed for a tube or cylinder is fed in upon an ordinary mandril between the rolls or cylinders for the purpose of rolling to a required length, diameter, and thickness, the combined action of the rolls or cylinders, whose motion

is rotary, simultaneously imparts a spiral motion to the metal or alloys of metal then undergoing the rolling process, so that independent of their agency the metal or alloys of metal is passed through with great speed, and is then introduced and rolled in like manner again until the same is in a condition to be "finished" at the draw bench by the usual method. *Patent completed.*

2615. J. WAINWRIGHT. Improvements in ventilating rooms and buildings. Dated Oct. 19, 1861. This invention is for improvements upon one patented by the present inventor the 20th Oct., 1858, No. 2345, and consists, 1, in perforating the lower bar of the lower sash of window frames, and in fitting over the same, inside the window, a slide made with perforations and solid parts, in such manner that the perforations in, and solid parts of, the slide may be brought entirely or partially over the apertures in the sash bar. Again, in some cases he receives the air in a case or trough, through apertures in the lower sash bar, and carries tubes up the side frames which communicate with the air case; and he provides outlets in the tubes at various levels. *Patent abandoned.*

2631. J. TOWAN. Improvements in machinery or apparatus for bending iron. Dated Oct. 21, 1861. This consists in the use of three rolls (suitably grooved), driven by any ordinary gearing, and so arranged as to impart any desired curve to the iron which is passed between them. These rolls are placed on three shafts, and made to overhang the bearings, each roll being pushed on its shaft endwise, and kept in position by a collar, and driven by a key. Two of the three rolls are made in two halves, so that one half may be removed, and thus admit of the easy disengagement of the hoop when formed. By changing the position of the rolls from one shaft to the other, the feathers upon the angle or T iron may be bent either externally or internally. *Patent abandoned.*

PROVISIONAL PROTECTIONS.

1021. D. Fryer, Carlton-square, Old Kent-road, Surrey, and W. J. Williams, Arundell-street, Strand, gentleman. Improvements in the method of and apparatus for letting on and cutting off the supply of gas to groups or districts of street and other lamps from a central point or depot. Dated April 10, 1862.

1054. J. Bunnett, Deptford, engineer. Improvements in revolving shutters, and in machinery for producing the same. Dated April 12, 1862.

1088. R. A. Peacock, St. Helier, Jersey, civil engineer. Improvements in constructing and working lock-gates for docks, harbours, canals, and navigable rivers.

1091. F. C. Philippson, Munzstrasse, Berlin. Improvements in steam hammers. (A communication.) Dated April 15, 1862.

1102. J. M. Rowan, Glasgow, Engineer. Improvements in manufacturing articles of cast steel.

1114. J. Weston, 80 Upper Whitecross-street, St. Luke's, engineer. Improvements in machinery for mortising, drilling, and dovetailing, and in tools to be used therewith. Dated April 16, 1862.

1125. J. L. Perin, engineer, 97 Rue du Faubourg, St. Antoine, Paris. Improvements in machinery for mortising wood.

1129. K. A. Brooman, 166 Fleet-street, patent agent. Improvements in buffing apparatus and in draw springs. (A communication.)

1135. R. Wedgwood, Barnes, Surrey, gentleman. Improved apparatus for facilitating the saving of life in cases of fire. Dated April 17, 1862.

1139. J. Shanks, Barrhead, Renfrew, plumber. Improvements in apparatus for promoting ventilation, also applicable to drying stoves.

1142. B. Rhodes, Old Ford-road, Bow, Middlesex. Improvements in the machinery for, and in the method of making, as also in the materials to be employed in the manufacture of cylinders, tubes, and other vessels from paper and other materials of fabrics.

1146. E. Loyell, Cannon-street, London, C. E. Improvements in locks and fastenings. Dated April 14, 1862.

1154. J. Pickard, engineer, and T. Morris, broker, Preston. Improvements in furnaces for the prevention or consumption of smoke.

1165. C. C. Creeke, Bournemouth, Hants, architect. Improvement in the construction of drain and other pipes. Dated April 21, 1862.

1196. J. Winsborough, 4 Sanson-terrace, Marlborough-road, Dalston, Middlesex, gas meter maker. Improvements in wet gas meters.

1204. R. Zimara, St. Petersburg, Russia, engineer. Improvements in stoves for heating and ventilating buildings. Dated April 24, 1861.

Correspondence.

1 Old Palace Yard, Westminster,

May 14th, 1862.

SIR,—For obvious reasons, I must decline to enter into any controversy, at the present moment, with those who have instructed Mr. Standbridge to reply to my letter.

Hereafter I shall have an opportunity of explaining very differently what he calls "the facts of the case," as well as the figures he quotes.

Without discussing Mr. Standbridge's lengthened apology, which, if read with care, goes far to prove my case, I must notwithstanding reassert, in the most literal and emphatic manner, my former statements, every one of which I am prepared to prove at the right time and in the proper way.

Inasmuch, however, as the payment to me of £45 has been introduced into this controversy, with which it has nothing to do, I may state that it was for two sets of preliminary designs made more than a year since, and prepared in accordance with special instructions before any estimate was made, and that a portion of the £45 was for travelling expenses connected with these services.

I may also repeat that I have been throughout ready to prepare new plans to meet the exigencies of the case, and that such readiness is not inconsistent, as Mr. Standbridge seems to suppose, with my statement that I could propose no mere alteration or rearrangement of the design then under consideration, to effect a greater saving than I had already made.

In writing to you at all, it was far from my wish to drag your readers into anything resembling a personal controversy, and I am not responsible for the introduction of topics hearing this character; I thought it right, however, that the profession should understand what it was that lurked under the guise of an open competition, and that it was seriously proposed by a municipal body to complete a building half finished by me, and "in accordance with my elevation," and on a plan which I repeat has been copied from one of mine, inasmuch as it shows arrangements which do not exist, except upon my drawings.

EDWARD M. BARRY.

May 15th, 1862.

SIR,—As I am given to understand that the Government bill for the concentration of the Law Courts will be again brought forward, and, like many others, being deeply interested in that matter as an owner of land and house property in the locality selected as the site of the proposed structure, I am induced to apply to you for advice as to the steps I ought to take, in order to ascertain the amount of compensation which I should be entitled to, in the event of the measure in question being carried out, and to prepare and make out my case for the same.

AN OLD SUBSCRIBER.

[Apply to some professional man or firm in the neighbourhood, such as Messrs. Hammond and Kirkland, Carey Street.]

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favour us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

W. W. (call at the office); B. and F. (attended to); W. H. (next week); L. L., W. H., G. P., A. W. S., H. B. and B., J. B., T. C. N., W. H., U. N., J. H. H., W. P.

J. V.—We shall attend to the question of Model Cottages for Working Men ere long.

S. S.—Without seeing the design it is not possible for us to advise.

M. N.—Will do well to consult an architect.

W. D.—Opinions differ widely on the point referred to.

L. F.—William of Wykeham was the founder.

T. S.—A mixed style undoubtedly.

** NOTICE.—The BUILDING NEWS will in future be published at 166 Fleet-street, where all communications and advertisements should be addressed.

THE BRITISH MUSEUM.

THE clique interested in the aggrandisement of South Kensington, have received a slight check in the refusal of the House of Commons to pass a Bill for the removal of a portion of the British Museum collections to that favoured spot, which, surrounded by the homes of the wealthy and the great, has come to be looked upon by the "upper ten thousand" as the centre of London, and the most easy of access. To Belgravia and Brompton it is, no doubt, very central; but what is it with regard to the inhabitants of three sides and the true centre of London?—to the inhabitants of something like nine-tenths of the metropolis, and to the visitors to London who are spread over those nine-tenths? Is it really, fairly, and honestly anything but an outlying district, a suburb? Mr. Bouverie has said, in evidence, "the public leave the London streets, cross the park, and soon arrive at the site." Pleasant picture! But the idea intended to be conveyed, applies to those only who live near the park. Let Mr. Bouverie some morning betake himself to—say Islington, where a tolerably large number of *British* people, for whom, as we understand it, the *British* Museum is maintained, reside. Thence let him start for the new centre of London so "easy of access." If he takes a cab he will find it a wearisome journey, and to many it would be a costly one. If shut up in a close-smelling omnibus, he will arrive at the favoured site in a frame of mind scarcely favourable to a day's enjoyment or study; and if he walks, and thousands and tens of thousands who visit the Museum would have to do so, or stay away, he would perhaps arrive at the conclusion that it was a rather wearisome journey through London streets, and a very short walk in comparison, across the park.

It is not unnecessary, once more, to raise a strong voice against the proposal, to take the British Museum to South Kensington, because the attempt has just failed. The subject will be again brought forward before long, and the defeat now experienced, will serve to teach those in command of the movement, the weak points of their late attack, which they will, no doubt, take care to strengthen when the question is revived. We hope that then some other members will be found to support Mr. Seymour, who, it appears, was the only gentleman who on Monday objected to the proposal, on the ground that it would render the art treasures of the Museum more accessible to the comparatively few inhabitants of the West End, and less accessible to the poorer inhabitants of other parts of the Metropolis.

There is no doubt that the present buildings in Bloomsbury are over-crowded, and that additional space is absolutely necessary, not only for the better display of the collections now exhibited, but also for the arrangement of a large collection which is stored away, and cannot be seen at all. But much of this inconvenience might be removed, as we have shown on a former occasion, by a judicious selection, and removal of many objects which really are of no value whatever to the larger proportion of visitors. These might still be accessible to students, in rooms where they could be arranged with much greater economy of space than is possible in rooms frequented by the general public. Besides this, however, additional buildings are required, and the want, daily becoming of more serious importance, has furnished the advocates for removal with an argument for the transfer to South Kensington. But to impart force to the argument it was thought necessary to show, that space could not be obtained contiguous to the Museum, and that the cost of erecting a new Museum at Kensington, including land, would be less than in Bloomsbury. The first consideration was disposed of by saying, that a larger space is required than can be conveniently obtained in the neighbourhood of the Museum; and in favour of the question of cost, it was asserted by the Chancellor of the Exchequer, that there would be a saving of some £300,000 in erecting a new Museum on the Commissioners' estate, instead of enlarging the present Museum. The trustees, who favour removal, have investigated the financial aspect of the question, and arrived at the conclusion that the cheapest ground in the neighbourhood of the Museum would be about £50,000 an acre, and as five acres are wanted, the cost of the ground, at the rate estimated, would be £250,000. The cost of building on the ground when it is secured is estimated at over £100,000 per acre, or £500,000 for covering five acres of land, making a total of £750,000.

The Commissioners of the Exhibition of 1851 happen to possess some land at South Kensington, for which they paid about £5,000 per acre, and as they consider the British Museum to be "an important national institution," they desire to be very generous. To erect a museum on their estate, they offer the land "at a lower price than the market value," or £10,000 per acre, just double the sum they paid for it. In the same report the Commissioners said, that they were anxious "to afford every facility in their power, and feel that they should not deal with the question as a purely commercial transaction." We find it is stated that the site thus available for a new British Museum would cost £50,000 only. The Chancellor of the Exchequer has examined the plans, and is able to give a "conjectural

estimate" of the probable cost of carrying them out; he also finds that the cost of building at South Kensington will be from 20 to 25 per cent. less than the cost of building in Bloomsbury! and therefore sets down the total cost of a new building at South Kensington at £500,000; altogether it is estimated that the cost at South Kensington would be from £670,000 to £680,000, and that the cost of the same operations at Bloomsbury would be from £960,000 to £970,000.

There is something eminently grotesque in the statement, that to erect a Museum at South Kensington would cost, for mere building, from 20 to 25 per cent. less than at Bloomsbury. But so says our Chancellor of the Exchequer, and he gives as reasons, that the style of the buildings in Bloomsbury is fixed by the present structure; at South Kensington "they would be able to employ and distribute the ground without reference to any previous considerations; and it would further be practicable to employ a lighter style of building, with a much greater amount of window space and of glass, which would be both cheaper and more convenient." It is scarcely necessary to point out the fallacy of this argument, unless it be intended to erect fresh "boilers" or "dishcovers," for the reception of the contents of the British Museum. If such is the case, and it is by no means unlikely, we acknowledge it at once, that such a structure would not harmonise with the present building in Great Russell Street, though it might with those at South Kensington. But we would at the same time assert most emphatically, that it would not only cost no more to erect buildings in connection with the present, in strict harmony with them, and even with a "greater amount of window space and glass," but that there would be an actual and large saving, of course assuming the proposed building at South Kensington to have any pretensions to architectural character. We need express no opinion as to the design of our present Museum, as it would not be necessary to reproduce the façade on each side. Architecture has advanced during the past twenty years, and the erection of three façades to harmonise with, though not to imitate, the present, would offer no very difficult problem to our architects.

The present is not the first time we have heard of the plans for this proposed new building. It is assumed that a building is to be erected before the plans are prepared, and we have the Chancellor of the Exchequer telling us that he has seen them, and we also learn that they are sufficiently detailed for estimates—"conjectural estimates"—to be framed. Under whose direction have these plans been prepared, and who takes such an interest in the matter as to ask for plans, before it is determined to erect the building? Does not the existence of such plans, show a strong determination somewhere, coupled with the assurance of influence, to grasp such of our art collections as may be found to want sufficient protection in the public voice?

Architects, too, are not uninterested in the aspect the question has assumed. Who prepared the plans? Is the designer of the Exhibition building to become the architect of all our national works? Have the Brompton boilers served to prepare the public for a series of such erections, in which we are to store our choicest works of art? It is impossible not to see, in the proposed removal of the Natural History Department, another grasp at the art and science collections of the nation.

THE INSTITUTE ON PROFESSIONAL PRACTICE AND CHARGES OF ARCHITECTS.

NOT a few questions of great moment are everywhere settled by common consent. Where there is no other rule laid down or law established, received custom obtains the force of law, especially in cases where matters concerned are obscure or difficult. It becomes therefore of great importance to know exactly the custom settled by common consent, where this vague and often lax rule is appealed to, and especially in questions of nicety and delicacy.

The remuneration of professional men is precisely a case in point. It is not difficult for any one with good sense, and a few facts to go upon, to decide pretty nearly what is a fair price for a thousand bricks, a suit of clothes, or a stack of hay; but where skill, experience, genius, and technical knowledge have to be paid for, the matter is not so simple;—while, from the character and standing of the persons concerned, it is desirable that the risk of disputes and dissatisfaction should be avoided.

On this account, the simple rule of an architect's remuneration by a commission of 5 per cent. upon the outlay which he superintends, having once become general, has been accepted and adhered to as a basis, although it affords most unequal, and sometimes inadequate remuneration. There are, however, numerous cases where this rule is clearly inapplicable, and there is much room for dispute as to what was exactly included in the duties thus paid for. An authoritative statement of the course pursued by the most experienced in their practice, has been accordingly a desideratum, and the Royal Institute

of British Architects has never taken a better or more useful work in hand than the preparation of such a document.

It has been known generally throughout the profession, that a standing Committee of the Institute has been for some time exerting itself to obtain the best information on professional practice, and to place it before the members in the best possible form. After the Committee had laboriously pursued work, then a special meeting of the members was held, to revise and finally sanction it. The result is the Report on Professional Practice and Architects' Charges, which will be found in another column. We believe we are correct in saying that this report, though embodying the most important points on all matters which it was thought necessary or desirable to print and circulate, does not exhaust the subjects submitted to the Committee; and that there are papers lying at the Institute Rooms to which the members of that body can have access, and from which they may derive valuable information.

The usual commission being first-named in this Report, the exceptions to it are subsequently given, the amount of work required to be done for it is accurately defined; and lastly the remuneration for works of a nature not strictly architectural, and which yet fall into an architect's hands, is determined.

The commission on works is a subject which has hitherto received careful examination in this journal.* We have shown that the method hitherto adopted, while very fair to the employers, was very unequal, and consequently unfair to the architect, and it is in cases where this inequality presses heaviest that the exceptions are made. The highest class of design is most properly recognised as exempt from the rule of remuneration by commission; also, very small works, which are known to every architect to consume labour and time out of all proportion to their cost, are similarly exempted. In the one case the remuneration is left to be settled by private agreement, and as the number of persons capable of doing such work is small, nothing else could well be done. In the other case, one which applies to all architects, the legitimate scale of charges is very properly laid down.

This scale has not been universally in use, though it has been long followed by certain architects, and officially recognised, and it will be felt as a relief to many, who, adhering to the 5 per cent. scale, and having many works of small magnitude, have felt the difficulty of their practice, and the inadequacy of their remuneration. It is not at all too high, and will, we hope, be generally adopted.

The case of an employer supplying part of his materials or labour, or of a large mass of old materials being taken as part payment by the builder, is considered and provided against. These conditions usually increase the trouble of the architect, and always diminish the cash paid. It is therefore only just that the value at builders' prices of the labour performed, or the materials supplied or found on the site, should be taken into account on calculating the commission. In the case of replacing, or adding to, or altering old buildings, it is always well, where possible, to make the contractor send in two estimates, one stating the cost of the work if the old materials become his property, and the other stating the cost if executed entirely of new materials, the old being sold to independent parties. The latter estimate would, of course, be the proper basis for commission.

Besides travelling expenses, the employer is chargeable for time consumed, where the distance of a work from the architect's place of business is unreasonably great; and for special services such as sometimes grow out of a building, but are really no part of the duties incident to executing works or preparing plans for them. These special services will be found enumerated in the report, and include negotiations as to site, party walls, lights, a *detailed* estimate beforehand, alterations of a material nature after the plans are complete, and measuring up extras and omissions.

It should be noted that these changes are many of them *permissive* and not obligatory. It is unquestionably unfair for an architect to carry out architectural works of an ordinary character for less than the usual remuneration, or for no remuneration at all; and this we believe is universally admitted by all respectable practising architects, and the reasons for it are very easy to understand. It may not, however, be equally clear why there may be any variation allowable in the rates charged above 5 per cent. The truth is, however, that these rates are very much questions of professional standing, and that although there is a standard below which it is not right for individuals to go, there is no necessary obstruction in the way of those who, believing or knowing themselves to be capable of doing better things than the majority of architects, consider it fair that they should be better paid.

Extra payment for time consumed in travelling deserves a moment's consideration. No architect is bound to demand it, and a young man, or one of small standing, if employed on distant work, would in many cases be unwise, and in some unjust, to think of demanding it. But if

people far off in the country require the services of the best talent that the metropolis can afford, it is but reasonable that they should pay something as a remuneration for the time actually lost by a professional man who, had he not been journeying, might have devoted the hours spent in the railway to profitable pursuits at home.

Similarly, the charges for designing monuments, stained glass, furniture, and the like, secure in many cases an excellence that perhaps only one hand in the United Kingdom can bestow, and it will be conceded by every one that such services deserve every encouragement and ample remuneration.

There are other portions of the report before us which deserve consideration, namely, those charges which are reckoned *below* 5 per cent.; the statement of the duties of an architect, the ownership of drawings, and miscellaneous services. It is interesting to compare the report now before us with two scales of professional charges issued by architectural societies, that of the Scotch architects and that of the Northern Architectural Society. Both of these scales have appeared in our columns, and the fact of their having been prepared and published shows how desirable it was that the document now under consideration should be prepared and issued under the best possible sanction.

INTERNATIONAL EXHIBITION.

THE PICTURE GALLERIES.

THE first question asked by persons who have not seen the pictures at the International Exhibition is, "How does the English School stand in comparison with the schools of the Continent?" The answer on a general view of the whole collection will be most satisfactory to our national self-esteem. Even after the eye has been accustomed to the foreign pictures for several days, those by native painters suffer little by the comparison with regard to art generally. The process by which this comparison is established, being the careful examination of upwards of four thousand works of art, with the necessary exertion of memory, is not a task very easily accomplished, and becomes exceedingly difficult in consequence of the pictures from the various countries of the Continent not being placed in the regular order of the catalogue, those of each country not being arranged together; and in many instances one picture by a certain artist will be found in the principal room, while the rest of his works are scattered through the side gallery. In this absence of classification, a complete conception of the whole is rendered impossible, and must be accepted as our excuse for irregularities which may arise in the course of the criticisms we intend to make, and the comparisons it will be our endeavour to establish. Such a collection of pictures as we now have in the galleries of the Exhibition, was the deficiency of the first Great Exhibition of 1851. That, however, without pictures, was a glorious success. The present Exhibition without pictures would have been a failure. The first was the spontaneous effort of an enterprising nation, sustained to completion by hearty good-will and enthusiastic cooperation; the present is the deliberate calculation of a party, and carried on amid divided interests and antagonistic councils.

One half of the space devoted to pictures, drawings, and engravings is occupied by works of the British School, the other half contains all the paintings, drawings, cartoons, and engravings sent for exhibition from the Continent. The collection of the English portion of the building illustrates our art from Reynolds, including examples of all the painters of that period down to those of the present day, whose works may be now also seen in the annual exhibition. The selections by the Continental authorities seem to have had no retrospective purpose, and are confined chiefly to living celebrities. Those who are tolerably well conversant with art, both in England and on the Continent, will no doubt be impressed with the idea that a general arrangement has been assented to and acted upon in the choice of pictures to be exhibited, both from abroad and on this side of the Channel; we allude to the evident absence of all eccentric productions as nearly as possible, and the eye passes along the whole range of the two galleries, both foreign and native, without meeting with a painting in a style which presents the slightest difficulty to the art-student. Turner does not blaze out in mystic splendour on the walls of the British Gallery, while on the French side Ingres and Delacroix are represented by a single picture each, and that the least peculiar of their known works. If this has been intentional, and in the interest of art, great praise is due, because sufficient mischief has been done to the public belief and judgment in art; as much by absurd conceits and "sensation" pictures, as by writings which have directed so much general attention to them.

Another remarkable feature of the Exhibition is that France has not put forth her strength. She certainly does not take the important position she is entitled to, and her powers in the higher department of art are rather indicated than represented. Hence an opinion has become general that French painters are scarcely equal to our own native artists. This is an error. On the present occasion she seems to have thought it more fair to meet us as nearly as possible on our own ground; but it must not be forgotten that a branch of art has been withheld—the profane and sacred historical—which would have not only covered our walls with fine painting, but our patrons of art with shame. In the British division of the gallery, we have historical and religious subjects by Cross, Hilton, and Maydon. The first has recently died wanting the necessities of life; the second would have probably paid the same penalty of a laudable ambition, had he

* See "Building News" for October 21, 1859.

not been made Keeper at the Royal Academy; and the last, after suffering poverty for some years, besides being imprisoned for debt, and living on charity, took his leave of the patrons of historical art by self-destruction. How it happens that our painters employed to decorate the palace at Westminster, have not come forward to vindicate the honour of the country, as regards historical painting, we think requires explanation. The Belgian contributors have not been so merciful to us as the French, for the paintings by Gallait are the finest works in the whole collection.

It must not, however, be assumed that, because the pictures sent from Paris do not strike at first sight, that there are not among them many examples of the elegant and imaginative branches of art to which we cannot produce satisfactory parallels; nor that, because the walls are not covered with high and sacred art, no attempt has been made to represent it. On the contrary, each class of subject seems to present itself in calm defiance of and patient confidence in the result of the comparison that may be made. The champion of the grand style will be found in a large picture by Auguste Bartholémy Glaize, bearing the ill-chosen title to Englishmen of "A Pillory." The word in French, by a free interpretation, means a display of great men. As an example of the large style of art, we have no painting that can be compared with it. Beneath it, on the right on entering the French Gallery, hangs "The Annunciation," by Amaury Duval, which for elegance of drawing, elevated delicacy of tint, and graceful composition, with a delightful sentiment of refined religion, the English School possesses no painter who could approach it. For poetry of tone and delicate gradations of tints, we cannot match the picture entitled "Francesco D'Assisi." As regards effect, finish, and the charmingly imaginative, where have we any work equal to "Illusions Destroyed," by Charles Glaire? Nowhere. The same answer must be given to a similar question respecting the solemn dignity of "Marie Antoinette passing from the Tribunal after Condemnation," by Paul Delaroche; and also as regards those small but beautiful and expressive pictures in a very low tone of colour, which hang close beneath it. Of the same kind, and equally poetic in treatment, is "The Procession to Calvary," by Armand Leleux. On the opposite side of the room is a landscape with which we have nothing to compare for classical treatment and balmy repose. It is by Charles F. Daubigny, entitled "The Banks of the Oise;" and of the perfectly ideal and elegant "My Sister is not Here," by Hamon, we have no counterpart. We are now giving merely a glance round the galleries, but shall go more fully into the merits of the pictures in future notices.

The German artists have sent several pictures which are entirely beyond the powers and above the aim of English painters. "The Holy Family," by Carl Müller, a picture painted in the most lovely manner, is one of them. The severity of the drawing is not quite so distinct as in the circular compositions by Raphael, at the Earl of Ellesmere's; but every part is extremely graceful and beautiful. A large gallery picture of "Nero after the burning of Rome," by Carl Piloty, is painted in a grand style, and the whole is finely conceived. "The Three Marys on the Morning of the Resurrection," by Carl Peschel, is excellent in tone as regards the subjects, and although very admirable, it is possible that Mr. Dyce would approach it should he attempt the same subject. "The Death of Nicolo, King of the Obotrites," by Theodor Schloepche, is finer as a whole, figures and horses taken together, than any artist we have could paint. "The Raising of Jairus' Daughter," by Gustav Reichter, if not absolutely grand, is composed with expressive simplicity, and is scientifically coloured.

Compare the two pictures by J. Israels, a Dutch artist—"The Shipwrecked" and "The Cradle"—the former painted in that sombre and monotonous style so well suited to the subject, and the latter, a most brilliant effect of sunlight on the figures, with the sea melting into aerial mist and space. Where, let us ask, is an English artist who ever thinks of painting from palettes so differently regulated, according to the sentiment of the subject?

The Swedish School sends us the works of two female painters, which we do not think our Society of Female Artists could equal. There is a refined delicacy and skilful arrangement in "Meditation"—a lady reading in an elegant boudoir—by Jeannette Möller; and "A Mother with her Child," besides two other clever pictures, by Amalia Lindgren. Another example of the change foreign artists made in their style of colouring, in accordance with their subjects, may be seen in the pictures by Frederick Hickert; and the Norwegian painter, Tideman, is not easily excelled in his humble and religious ceremonies.

Of the Danish School, we have a classical scene from the "Andria" of Terence, by Abildgaard. The collection from Russia is very interesting. In it we find, among the higher order of art, a rather pre-Raphaelite "Virgin and Infant Saviour," by Theodore Bruni, but graceful and well painted; and a fine picture, of gallery size, of "Jesus and Mary Magdalene" (noli me tangere), very classically and elegantly treated, and the event as expressively illustrated. Taking this work, by Alexander Ivanhof, as a whole, we do not know an English painter who could equal it. In domestic pathos, with admirable execution of accessories, "The Widow," by Paul Fedotof, we have seldom seen excelled, and we should be happy to see the feeling and propriety of treatment in "The Peasant Girl receiving the Holy Communion," by Alexis Venezianof, more frequently displayed by English painters.

The Belgian School, as we have said, is the great point of interest, in consequence of its exhibiting the two wonderfully dramatic pictures by Gallait—"The Last Moments of Count Egmont" and "The Last Honours paid to Counts Egmont and Horn." There are, besides, several other pictures by the same artist, which make that side of the Belgian room

remarkably effective and attractive. This room is further enriched with pictures by Leys, relative to the history of the Netherlands and the Reformation; numerous productions by Madou, the Wilkie of Belgium, of a very amusing description; two fine pictures by Pawels; a very impressive subject, by Slingenev, of "A Martyr in the days of Diocletian" about to be torn to pieces by wild beasts; and some large cattle pictures, by Verboeckhoven and L. Robbie.

The Spanish painter, Antonio Gisbert, sends a picture full of fine sentiment, entitled, "The Execution of Padillo, Bravo, and Maldonado;" and a small, but highly scientific one, as regards arrangement of tone, representing "The Death of Don Carlos" (son of Philip II.), and "Queen Joanna embracing the Coffin which contained the Body of her Husband," by Gabriel Maureta.

Italy exhibits no painting of importance, except "The Taking of Jerusalem," in which there is much elegant drawing and treatment; but there are some fine large drawings in pen and ink from the "Inferno," "Purgatorio," and "Paradiso" of Dante, quite original in conception, and most elaborately, as well as very gracefully composed.

We have now briefly directed attention to the chief points of the foreign schools, in all of which we find either superiority in choice of subject, imaginative arrangement in accordance with the sentiment of the scene, or refinement in the general treatment, and all of which we should be happy to see the English School make some attempt to emulate. But it must not be supposed because, according to the rules of politeness, we give priority of consideration to the stranger, that in our next number we shall not be able to show in what the English School excels those of the Continent, if not in those of the present day, at least in the productions of the great English masters—the fathers of British Art.

ROYAL ACADEMY.—ARCHITECTURAL DRAWINGS.

THE reflection recurs to us, as we again look upon the architectural drawings at the Royal Academy, that a union of the works here exhibited with those displayed in Conduit Street, would united constitute a creditable exhibition of architectural art, and convey a fair, although by no means a full, idea of what has recently been executed or projected by English architects. Divided as architects have been since the establishment of the Architectural Exhibition, some twelve years since, it is with difficulty that we can compass their aggregate importance. We cannot but remember also that a considerable number of drawings reserved for this more aristocratic gallery are annually returned to teach a lesson to their disappointed owners, instead of being hung for the instruction of their professional brethren. It is then too late to send them to the Architectural Exhibition. Between the two Galleries, many works "go the wall" in the offices of their respective owners. We must be contented, in the words which adorn the title page of this year's Catalogue, "to make up our idea of perfection from the excellences that are dispersed" over the several Galleries—in Conduit Street, South Kensington and Trafalgar Square, and banish all expectation of finding it exclusively in either locality. The International Exhibition has a goodly show, but they are chiefly gathered from former exhibitions. The superior attractions of the Royal Academy have likewise influenced our architects, and renders it easy to account for the poverty so conspicuous at Conduit Street.

The post of honour is deservedly occupied by a large and brilliant drawing of Mr. Page's Design for Blackfriars Bridge. It consists of three iron segmental arches with pierced spandrels, supported by red granite piers. Works of sculpture surmount the piers. The abutments are pierced by single rusticated arches, which hardly correspond with the general character of the bridge. The lines of the bridge are grand in the extreme, and the ornament surrounding the coloured shields in the spandrels most judiciously introduced. If erected as here shown, it will far surpass anything which has hitherto spanned the river. What, however, is meant for its crowning decoration, is, as here placed, its greatest defect, and, if persisted in, will tend to mar its entire appearance. We allude to the colossal groups of sculpture upon the piers. They are represented as facing the river. From the bridge, therefore, their back views must be simply uninteresting. Moreover, towering above the horizontal line of the bridge, they break it at regular intervals in the most unpleasant fashion and unnecessarily disfigure this its principal feature. This bad arrangement is the more to be regretted, because it could so easily have been rectified. We admit the appropriateness of sculptured groups, but why, we ask, were they put upon the bridge to stand bulkily against the sky? They destroy the fine stretch of line which links shore to shore, and, so placed, are further removed from the river passengers, without being, even in themselves, of interest to the people on the bridge. They could just as well be fixed *in front* of the piers, the pale red colour of which would then form a charming background to them; they would then enrich what is now too plain, be nearer the eye of all possible spectators and leave in calm repose the splendid outline of the bridge which they now so rudely intrude themselves upon.

Leaving the projected improvement in the appearance of the river, which is likely soon to be realised, we come, in 889, 890, to two "Studies relative to the Embankment Question," by Mr. Newton, which are of a speculative character. The author's notion is to avoid all interference with private property. He views the embankments as Government estates, upon which stately buildings, after the style of Somerset House, might, in course of years, be erected; and he forms in the rear of the embankments open docks, so as to communicate with the different wharves. After Mr. Cowper's explanation of the Government's intention, there is not much

chance of Mr. Newton's design being realised. Mr. Charles Henman (834) treats us to a somewhat similar idea; but, instead of palatial buildings, he shows fire-proof warehouses on the banks, relieved by glazed promenades, and the author's "system of street architecture, in accordance with the requirements of the age," which altogether strikes us as being even uglier than the present aspect of the shores.

A conspicuous drawing is exhibited, by Captain Fowke, of the "Industrial Museum of Scotland," 892. To say that it is better than the International Exhibition is not, perhaps, saying much. The style is that of an Italian villa magnified. In fact, there is a villa hanging near it, by Mr. Masey, 885, which, although in size not one-quarter of it, is in design infinitely greater. The characteristic of the Museum is that of all Captain Fowke's work—swollen littleness. We see that, although designed by Captain Fowke, it is erected under the *superintendence* of a local architect. We think it a pity that they did not exchange their relative duties. Edinburgh might then have been able to boast of a finer building, and London, at the same time, have escaped the infliction of an uglier one.

Mr. Godfrey Sykes shows the first sketch for filling the blank arcades in the Cromwell Road with mosaics. Groups of figures, illustrative of arts and manufactures, shaded in sepia, are introduced within grey and red bands. In the heads of the arches the raw material connected with each subject is depicted. The designs are exquisitely drawn and coloured, but they would as fitly be attached to a brick-kiln as to that grandly gloomy front. There is only one appropriate way to destroy its blankness, and it is, moreover, one peculiarly suited to the business instincts of the Commissioners—that is, to let the series of arcades for advertisements. People would then stop to look at it, and the commercial success of the scheme would gladden the hearts of Commissioners who have shown such aptitude for creating rights, and selling them.

Mr. Newton has a "Study relative to the Composition of the Vertical Lines of an Obelisk, and the Horizontal Lines of a Bridge." Since it was prepared, the obelisk fever has subsided; but we may remark that in this bird's-eye view no horizontal line is seen at all, and that the lines of the obelisk compose chiefly with the curved lines of the trees behind them. The design, however, is not the less good because of Mr. Newton's incomprehensible description of it.

A "Proposed Memorial to the late Prince Consort for Newport Church, Isle of Wight" (853), by Mr. F. Mew, is an artistic mural monument, conceived in a true Gothic spirit, but free from the fetters which too frequently cramp the action of the revivalists. It is, moreover, highly creditable to a provincial town that they have preferred a design of this kind to the stereotyped editions of dull marble statues by second-rate sculptors. The memorial is placed between two windows, which are bordered with encaustic tiles bearing the royal cipher. The windows are appropriately filled with stained glass. In the spandrels of the windows, enclosed by ornamented quatrefoiled circles, figures of angels holding inscribed bands are incised. The incisions are filled in with black plaster, after the fashion of the Italian *intagliata* recently introduced into several churches by Mr. Butterfield and Mr. Street. A canopy is placed between the windows. It is supported by marble shafts of different colours resting on corbels, and is tastefully, if not expensively, enriched. A carved head of the Prince, in relief, is seen in the arch; an inscription occupies the space between the shafts. A band, bearing a Biblical motto, stretches from side to side under the whole composition. It is stopped at the ends by carved angels, which, we think, the architect might in execution very wisely dispense with, or else incise them, as he has done those bearing the upper mottoes.

A design for the same subject by Mr. Bellhouse (842) is hung too high to be properly examined. It looks more like a factory chimney in the rear of an Italian town-hall than a Christian monument. Of other memorials we have one of 1851 by Mr. J. Lewin (841), which resembles Scott's monument at Edinburgh; and another of the same subject by Mr. H. S. Legg, which we have seen exhibited before. It is in three stages, with lions and figures at the angles, and statues of the Queen and Prince Consort on the summit. Mr. F. P. Cockerell sends a masterly restoration of the Street of Tombs, Pompeii. It represents a funeral procession issuing from the gates, and the mountains above Salerno in the distance.

Mr. Teulon exhibits a memorial to William Tyndale (859), a well-proportioned, simple, and imposing grey pile, with bands of brown stone occasionally introduced into it; Mr. M. Digby Wyatt, the granite monument placed over the grave of the late President of the Institution of Civil Engineers, in Kensal Green Cemetery; and Messrs. Tallis and Perron the fine tower which was, on the suggestion of J. J. Rogers, Esq., M.P., most judiciously substituted for the monumental column to Sir H. Davy's memory at Penzance.

One of Mr. Street's customary etchings (878) represents the interior of the church of St. James' the Less, Westminster, as it has been completed. In 843 we have a design for Christ Church, Pentonville, by Mr. Brock, which has evidently been founded upon the exterior of the same church. But with a hazy likeness in its general design there is unfortunately none in the details. There is a want of breadth in the whole composition, and the lower gables over the arches of the tower are a palpable mistake.

Mr. H. E. Kendall, jun., displays upon an ostentatious scale an extensively got-up design for a mansion "in the old English style now erecting." It contains a profusion of barge boards, gables, chimneys, and dormers, grouped together with considerable skill, but there is an evident want of taste in the exaggerated forms and dimensions of the detail. Moreover, if we mistake not, the whole thing, as regards its half-timbered "old English" style, is a huge sham. We cannot conceive a gentleman insane enough to dwell within wood and lath and plaster walls, when possessing

the means so elaborately to ornament them. It is *venerated with*, not *in* the old English style, and is wanting in the true principles which guided the middle-age builders. As a specimen of imitation it is as clever as a piece of wall-space lined and drawn to resemble stone might be made, but it sinks beneath the level of art and of "the old English style" altogether.

844, Hawkeyhurst, Hants, is a far more genuine design. The high pitched roofs and gables, turrets, chimneys, and bay windows are here introduced with a thorough appreciation of their value, and the true artist is seen in the way in which the red color of the brick chimneys is, by means of diapers and bands of roof tiles, made to harmonise with the cool grey stone of the walls.

The "Design for an Exchange for a large Commercial City" (845), by Mr. Watson, received, we believe, the gold medal of the Royal Academy. The geometrical drawings and plan are hung in Conduit Street. It is highly creditable as the work of a young architect, and the upper stage of the tower is a feature of singular beauty. Mr. Phené Spiers contributes several talented studies of old French buildings; Mr. Cole, a fine view of Antwerp Cathedral; and Mr. Johnson, some drawings of Westminster Abbey. The "Design for the Palais de Justice at Brussels" (876), by Mr. Kerr, is in the severer Roman style, with a colossal dome rising in the centre of it. The late Sir Charles Barry is represented by his design for the Halifax Town Hall, now in course of erection, with modifications by his son. The proportions of the façades indicate the ripe scholarship of its distinguished author, but the upper portion of the tower—shaped like an obelisk—is no ornament to it, and of very little use, since it serves only to conceal the stairs which lead to a balcony near the summit. The "Shooting Box," by Mr. E. M. Barry (893), is scarcely more than a box with rectangular apertures and a high roof. Mr. Gray's "Design for Houses in Gore Road, South Kensington" (894), is an extension of the well-known style which he has adopted in the neighbourhood of Covent Garden. The "Dwelling House at Wantage, Berks," by Mr. Brooks (832), is a red brick building, with bricks laid herring-bone fashion in the arch heads over the windows. This style of work is all very well occasionally used as a contrast to other detail, but a repetition of it throughout the building shows poverty rather than fertility of invention. With a profusion of cuspings and jagged pinnacles, Mr. Smith has composed his "Design for a Memorial Church at Hertford" (835). Mr. Manning's "St. Olave's, Ramsay" (838), is the drawing from which the photograph was taken which hangs at the Architectural Exhibition. Mr. R. W. Edis, in a couple of views, shows a simple but clever "Villa Residence at Uxbridge" (836, 837). Equally clever, and in a similar style, is the selected "Design for Rugby Cemetery" by Mr. Bidlake (846), but the same architect is hardly so successful in the "Design for the New Markets at Chester." "The Church of St. Charles Borromeo" of Messrs. Willson and Nicholl has afforded them an opportunity of producing two spirited etchings, but they are too slightly dashed in to enable us to judge properly of the design. Mr. Ashpitel's "New Church, at Sutton, Kent" (847), is based upon a good model. It appears, in fact, more like the restoration of an old church than a design for a new one. The weak point is the bell turret, which no one would possibly take to be other than a modern work. Mr. Sang's first prize design for covering the Merchants' Area of the Royal Exchange deserves examination, on account of the excellent and artistic manner in which the desired object is achieved.

Mr. Goldie's originality has full scope in his St. Wilfred's R. C. Church, York (855), but, as is too frequently the case, it betrays him into exaggeration. This is plainly seen in the deep splay over the shallow plinth of the tower, and in the slender columns, placed one over the other, without even a string intervening between them. It is original, certainly; but that is all we can say for it, if we do not add, that it is also unmistakably ugly. From the fact of Mr. J. P. Jones exhibiting a second time his design for a cemetery (856), he evidently has a higher opinion of it than anyone else is likely to entertain. A very clever Italian villa design (858), by Mr. J. Giles, has likewise been already noticed by us, in the Conduit Street Gallery. It is to be regretted that the design for the Hull Town Hall, by Messrs. Masey and Evers (860), was not sent to the Architectural Exhibition, where so many of the competition designs are hung. It is Italian, with tower in the centre, and steep square roof over the wings. The three-quarter columns tacked on the front, between the windows, are worse than unnecessary. With that exception, the design is a very good one. Mr. George Godwin's "Bailiff's House and Stabling" is, we fancy, an old design.

873 is a suggestion, by Mr. Naden, for relieving the present crowded state of the metropolis. It is most elaborately worked out, but there are numberless obstacles to it, which have been conveniently or innocently ignored. A railway is proposed to be suspended in the centre of the street, with a roadway between it and the present thoroughfares.

We cannot do more than briefly direct attention to Mr. Tarring's Jacobin design for a gentleman's mansion (884); to the four colossal trees which fortunately conceal the major portion of Mr. D. A. Deane's "New Building to be erected at Christ Church College, Oxford"—(if it be no better than it is here represented by Mr. Pollen, we fervently hope that they may always be sufficiently leafy to conceal it); to Messrs. Pritchard and Seddon's brilliantly decorated organ, now in the International Exhibition; to Mr. R. P. Pope's simple, but highly effective design for St. Bartholomew's Hospital, at Chatham (898); to the house of Mr. Wilkinson (899); to the stained glass of Mr. Seddon and Mr. A. O'Connor; and, lastly, to the able manner in which Mr. Digby Wyatt has welded the interlaced work, and the distinctive features of old Irish architecture to the houses in Grafton Street, Dublin (900).

GAS APPARATUS AT THE INTERNATIONAL EXHIBITION.

TO describe the improvements effected since the first Exhibition in 1851, in the manufacture of illuminating gas, is easily accomplished. For the information of some readers, it may be useful to mention, that the gas now burned for lighting all towns in Great Britain and Ireland is exclusively made from coal. Cast-iron or fire-clay vessels, called retorts, are heated to redness by furnaces fired underneath, in which state coal is introduced into the retorts, the heat of which causes gaseous vapour to be driven off. This volatile matter is cooled by being passed through pipes connected together in the open air, when tar and ammonia water are condensed. To render the gas fit for use, all that is now necessary is to remove its two worst impurities, carbonic acid and sulphuretted hydrogen, which can be economically done by hydrate of lime. When coal has been subjected to heat in a closed vessel from four to six hours, all the useful gas is removed, and the residuum of the coal left is changed into coke, which is extracted and cooled by water. Gas made in this manner would be a fair average of the quality generally supplied. All improvements should at least either conduce to something appreciable, such as goodness, cheapness, &c.

Nothing better illustrates the alteration effected during the past decennial period than the number of exhibitors of fire-clay gas retorts. This has arisen through iron retorts being discontinued in almost every town exceeding ten thousand inhabitants; consequently, now fire-clay gas retorts are an important feature in the building. Through having had the opportunity of seeing many of the retorts before the opening of the Exhibition, it could not escape observation that many are made of the finest ground clay, and unfit for practical use. The object being to give the outside of the retorts the smoothness of marble, and the inside the fineness of grain of loaf sugar. To accomplish their purpose, some of the manufacturers have entered on the cost of making and burning nearly a dozen retorts to secure a single sound one. All, however, have not succeeded in doing this, as in one a long crack may be discovered painted over with many words; in another, the perceptible flaw is hid by being placed against a heavy article which would take several men to move. Why endeavour to show goods what they are not?

In order to make a serviceable fire-clay gas retort, such as will stand drying and burning without cracking, it is necessary to mix with the ground fire-clay some broken up brick previously burnt. But this mode would cause the material of the retorts to have the consistence of mortar made with unscreened sand. Clay for fire-brick work should contain no lime, magnesia, or iron, on account of these substances being quickly affected by heat. The slate clay from the coal series is employed in England. At the termination nearly of the machinery department, Western Annexe, there are some comparatively enormous pieces of burnt fire-clay goods for gas purposes, &c., surpassing in size anything exhibited elsewhere. This part is Belgian, the manufacturers being Monsieur Th. Boucher, who obtained a medal at the last Exhibition, a Monsieur A. Keller, and others. In Class III., Messrs. Cowey, Blaydon-Burn, show as well as they can in a corner two beautifully made gas retorts, manufactured from the Newcastle clay. Here also Messrs. William Stephenson and Son have a stall; their retorts look well, but they are thickly coloured with bone ash; the same may be said of Messrs. Clift and Son's patent enameled retort made from Wortley clay, the quality of which is probably as good as it appears; but goods of this description certainly should not be artificially whitened all over.

In Eastern Annexe, Class I., may be seen a very good D-shaped retort of Stourbridge clay, manufactured by Messrs. John Hall and Co. A stall of Mr. Addison Potter contains a beautiful little model of seven fire-clay D gas retorts, set under a double furnace, fixed complete with mouth-pieces and ascension pipes—such as are in general use in gas-works. Messrs. Harper and Moore likewise show diminutive models in fire-clay for the distillation of coal gas. There is also to be viewed in Class I. a six-bed of Walcott's patent gas retorts, erected full size, together with explanatory working drawings, being exactly similar to two settings now working at the "West London Junction Gas-Works." These patent retorts have both their sides solid, which permits either the top or floor to be cut out and renewed when necessary; thus a setting of several patent retorts may be effectually repaired from time to time so as to last very many years. Several other advantages over the common mode is stated to be obtained by this invention. Managers of gas-works should note this for one of their objects for inspection when visiting the Exhibition. Some of the manufacturers show on their stalls samples of the fire-clay as raised by them. One has three different kinds: the first is described as best glass house pot-clay; the second as best black crucible clay, used for making melting-pots for brass, malleable iron, &c.; the third, as second black crucible clay, for making melting-pots for brass, malleable iron, &c. No chemical analysis of their fire-clays is given by Exhibitors from any part; this omission should be rectified on the next occasion. About two parts of silica to one of alumina forms the base of the best fire-clays; when the silica exceeds this proportion, as in the South Wales fire-clay, it is insufficiently plastic, and when alumina exists in a larger degree it is less refractory to fire.

Returning to Class X., the attention of persons residing in single country houses cannot fail to be attracted by the pretty show of coal gas apparatus. At the last Exhibition there were several modes shown for making oil gas, under the fancy names of vegetable gas, &c.; now not one is to be seen. "The Journal of the Board of Arts, &c.," Upper Canada, mentions "that the Canadian department at the International Exhibition should be illuminated with gas manufactured from Enniskillen petroleum (rock oil), and

Mr. J. E. Thompson of Toronto will send one of his portable petroleum gas-retorts, with purifiers and gasometers complete for this purpose." So far from this prediction occurring, not even a single bottle of this rock oil can be seen in the Canadian departments, on account of the Exhibition authorities refusing to allow what has been sent to remain there; fearing doubtlessly of incurring increased risk of fire. This oil requires to be purified and deodorised by sulphuric acid and alkalis before being used in lamps. A gallon of oil, price 1s., may be fairly calculated to produce 100 cubic feet of gas, which is 10s. per 1000, exclusive of labour, furnace fuel, &c. Where expense is any object it can never compete with coal for gas purposes.

(To be concluded in our next.)

PROFESSIONAL PRACTICE AND ARCHITECTS' CHARGES.

A MEETING of members only of the Royal Institute of British Architects was held at the Rooms, 9 Conduit Street, Regent Street, on Monday, the 12th inst., to reconsider the resolutions respecting professional practice and charges of architects; Mr. OWEN JONES, Vice-President, in the chair.

It was moved by Professor DONALDSON, seconded by Mr. STREET, and unanimously agreed to, that the paper of professional practice and charges of architects some time ago forwarded by the council to the members be confirmed and adopted. The following is a copy of the paper referred to:—

"The usual remuneration for an architect's services, except as herein-after mentioned, is a commission of 5 per cent. on the total cost of the work executed from his designs; besides which, all travelling and other incidental expenses incurred by the architect are paid by the employer, who is also chargeable under certain conditions, as hereafter mentioned, for time occupied in travelling.

"But in all works in which the art required is of a high kind, and the expenditure mainly for skilled labour and not for materials, as e. g. in designs for the furniture and fittings of buildings, in their decoration with painting or mosaic, for their sculpture, for stained glass, and other like works, the architect's charge is not made by way of commission on the cost, nor does it depend upon the time employed in making the design, but is regulated by special circumstances, and varies according to the skill and artistic power of the architect.

"A commission of 2½ per cent. is to be charged upon such works as sculpture, stained glass, and others of a similar nature, for which the architect does not give the design, but arranges with the artists or tradesmen, and directs the work generally.

"In works under £500 in amount, 5 per cent. is not fairly to be considered as remunerative, and in such cases it is just to the employer as well as to the architect, to charge by time or by a scale, varying from 10 per cent. for works under £100, to 5 per cent. on amounts above £500.

"The commission is reckoned upon the total cost of the works, valued as if executed entirely by labour and of new materials provided by the builder.

"The commission is to be charged upon the whole value of the work executed, with the addition of 2½ per cent. upon any omissions. This is exclusive of the charge for measuring extras and omissions.

"The architect is entitled during the progress of the building to payment on account at the rate of 5 per cent. on the instalments paid to the builder, or otherwise to half the commission on the signing of the contract, and the remainder by instalments as above.

"All travelling expenses are to be charged extra.

"These rules suppose the work to be executed within an easy distance of the architect's office; but if the work is executed at a considerable or inconvenient distance from it, an allowance beyond the 5 per cent. ought to be made for the time occupied in travelling, in addition to the actual expenses.

"The percentage does not cover professional services in connection with negotiations for site, arrangements respecting party walls, or right of lights, nor services incidental to arrangements consequent upon the failure of builders whilst carrying out work; but all such and similar services are charged for in addition, the basis for charge being the time employed.

"Supposing that the employer, after having agreed to a design, and having had the drawings prepared, should have material alterations made, an extra charge may be made according to the time occupied.

"If the architect should have drawn out the design complete, with plans, elevations, sections, and specification, ready for estimate, the charge is half the usual commission above named.

"If the architect should have, in addition, procured tenders in accordance with the instruction of his employer, the charge is half per cent. extra to the above.

"For works in the alteration of premises, the remuneration may be increased according to the time, skill, and trouble involved.

"All of the following requirements for the buildings are included in the ordinary charge of 5 per cent.:

"Preliminary sketches.

"Working drawings and specifications sufficient for an estimate and contract.

"Detailed drawings and instructions for execution.

"General superintendence of works (exclusive of clerk of works).

"Examining and passing the accounts (exclusive of measuring and making out extras and omissions).

"No additional remuneration is due for making such a rough estimate as

may be obtained, for instance, by cubing out the contents. If a detailed estimate be framed, additional remuneration is due from the employer.

"An architect is bound, under the 5 per cent. charge, to provide one set of drawings and one set of tracings, with duplicate specification; it being understood that the architect is paid for the use only of the drawings and specification, and that they remain the property of the architect.

"The charge for taking a plan of an estate, laying it out, and arranging for building upon, should be regulated by the time, skill, and trouble involved.

"For actually letting the several plots (in ordinary cases), not exceeding a whole year's ground rent may be charged.

"For inspecting the buildings during their progress (so far as may be necessary to ensure the conditions being fulfilled) and finally certifying for lease, the charge should be a percentage not exceeding half per cent. up to £5,000, and above that by special arrangement.

"All the above fees to be exclusive of travelling expenses, and time occupied in travelling, as before mentioned.

"The charge for the above does not include the commission for preparing specification, directing, superintending, and certifying for the proper formation of roads, fences, and other works executed at the cost of the employer, nor for putting the plans on the leases.

"The following definite charges are recognised for valuation of property:—

"The charge throughout is 1 per cent. on the first £1,000, and half per cent. on the remainder up to £10,000. Below £1,000 and beyond £10,000 by special arrangement. These charges do not include travelling expenses, nor attendance before juries, arbitrators, &c.

"The charge per day which may be made by architects, depends upon their professional position, but the minimum charge is three guineas per day.

The charge for dilapidations, when estimated, is 5 per cent. as estimated, and in no case less than £2 2s.

"It is not desirable that an architect should supply to builders quantities on which to form tenders for executing his design; but in case of such being done it should be with the concurrence of the employer, and the architect should be paid by him and not by the builder."

BRICKS AND TILES.*

THE art of the brickmaker has been practised by nearly every civilised nation of which we have any record; the manufacture of bricks, and the employment of them for building purposes, dating from the remotest antiquity, and the use of that distinctive form of bricks to which we have given the name of tiles being probably almost, if not quite as ancient. Nor is this to be wondered at when it is recollected that in all countries where timber or stone are difficult to procure or to work, the natural resource must be the employment, as a building material, of baked or sun-dried earth or clay, in some shape. In such districts or provinces, however, as furnish stones of portable dimensions, or accessible and easily-worked quarries, and in such as abound in timber, the building art has often made great progress without recourse being had to artificial materials; and in these localities, bricks, being little needed, are often almost unknown, and sometimes even tiles are little employed. Portions of Norway and of Switzerland may be referred to as furnishing examples either of the exclusive use of timber or of its employment in conjunction with only a small quantity of stone for structures. Certain districts of France in the middle ages, and some parts of the north of England and Scotland at the present day, furnish on the other hand instances of the almost universal employment of stone with just so much timber as is indispensable, in each case to the exclusion of brick; but exceptional localities such as these afford almost the only instances of the total absence from buildings of some form or other of artificial building, roofing, or paving materials.

The Babylonians, the Egyptians, and the Assyrians, among the nations of remote antiquity, all made use of bricks, to a great extent, and in the Bible references to this material, as made among all of these nations, are to be found. These references form the earliest authentic accounts of the employment of bricks; but Josephus mentions a tradition which attributes to the sons of Seth a knowledge of their use, and which, if true, would thus carry back their origin to the very earliest period of the history of the human race.

The first mention of bricks in Scripture is to be found in the account (Genesis xi. 3, 4) of the building of the city and tower of Babel. Here the making and burning of bricks is spoken of as the first work undertaken preparatory to building, and it is worth remark that the writer incidentally betrays the fact that he was writing at a time and in a place where stone was principally, if not exclusively employed, for he says, "brick had they for stone."

The next Scripture mention of bricks occurs in the account of the bondage of the Israelites in the land of Egypt (Exod. i. 13, 14, and v. 6-19). Here we have an account of the employment of the captives in the manufacture of bricks, and also in the erection of buildings for Pharaoh.

In the history of David (2 Samuel xii. 31), we have a reference to a brick-kiln, not, however, in the territory of the Jews, but in the adjoining country of the Ammonites; for it is in that history recorded that, having

taken Rabbah, the capital of that country, David, beside other modes of destroying or humiliating the inhabitants, "made them to pass through the brick-kiln."

In the book of Isaiah bricks are twice mentioned, and in both cases in such a way as to show that they were held in low estimation as compared with stone. In the first of these passages (Isaiah ix. 9, 10), the prophet says that the people "say in the pride and stoutness of heart, the bricks are fallen down, but we will build with hewn stones." In the second passage (Isaiah lxxv. 3), a long series of gross breaches of law and propriety are being recited, and among the first of them occurs the reproach that the people "burneth incense upon altars of brick."

In the book of Jeremiah we have again a reference, at a date about eight centuries after the one in the book of Exodus, to the brick-making of Egypt. The Jews at that time had fled into Egypt, and the prophet, who was among them, being about to proclaim the destruction by fire of the gods of the Egyptians, was thus directed; (Jeremiah xliii. 9) "take great stones in thine hand, and hide them in the clay in the brick-kiln, which is at the entry of Pharaoh's house in Tahpanhes."

Lastly, in the book of Nahum, there occurs a reference to the city of Nineveh (Nahum iii. 14), from which it is clear that bricks were understood to be the ordinary material applicable to the fortifications of that city. Foretelling invasion and attack, the prophet says "draw thee waters for the siege, fortify thy strongholds: go into clay, and tread the mortar, make strong the brick-kiln." And these references to the customary employment of brick by the Babylonians, the Ninevites, and the Egyptians will be found corroborated by the accounts of profane historians, such as Herodotus and Xenophon, and by the researches of modern discoverers.

Among these three nations the use of two sorts of bricks, some being kiln-burnt and others merely dried in the sun, appears to have been general; the employment of glazed or enameled bricks as a decoration for the face of walls appears also to have been common both at Nineveh and Babylon, and an immense number of glazed and coloured bricks exist among the ruins of both these cities.

Many ancient bricks show marks of having had reeds or other such substances worked up along with the material of which they were made, apparently to render it more tenacious. The Scripture account of the brick-making performed by the Israelites in Egypt, already referred to, shows that they were compelled to employ straw in forming the bricks they made. It was also, for many ages, customary to stamp each brick with a device, or an inscription, or both, a circumstance which has afforded much useful historical information as to the date and occasion of the erection of the buildings from the ruins of which they come; thus, for example, Mr. Layard was enabled to identify the celebrated "Birs Nimroud" as the ruin of a building of Nebuchadnezzar, by finding that every brick removed from that mound was impressed with his name. Egyptian bricks are usually inscribed, and it was enjoined by law (Smith's Diet. Antiquities, art. "Later") upon the Romans that the bricks they made should be thus marked. Bricks so inscribed have been found in our own country at York, and bear marks showing the presence of certain Roman legions, for or by whom they were made. The same thing has occurred in Germany, and at Caerleon. (Diet. of Arch. Pub. Society, art. "Bricks.")

Herodotus, describing the building of the walls of Babylon, says, "They made bricks of the earth, borne out from the trenches, and having drawn out a suitable quantity, they burnt them in furnaces." This is said to be the earliest reference in profane history to the subject; many subsequent ones might, however, be adduced, relating both to the works of the earlier nations already named, and to those of the Greeks and Romans. Many specimens of inscribed bricks, the Assyrian ones being impressed with inscriptions in cuneiform characters, and the Egyptian ones with hieroglyphics, may be seen in the British Museum. For a full account of the manufacture, as practised by the Egyptians, with an engraving from a celebrated painting in a tomb at Thebes, representing the process, and for illustrations of the almost universal employment of this material, consult Sir Gardiner Wilkinson's Works. (Ancient Egyptians, vol. ii. pp. 97, 98; also Manners and Customs of the Egyptians.)

The Greeks appear to have built less in brick than the Egyptians or the Romans, yet it is clear that they did employ bricks to a considerable extent. Pliny informs us that the Greeks made four sizes of them, and Vitruvius also refers to the same fact. The Romans are known to have employed brick most extensively, and have left many remains of brickwork in every part of their dominions. On this point a reliable authority observes (Diet. of Arch. Pub. Soc.), "Examples might be multiplied of the mention of bricks by Greek writers;" and adds, "The mention of bricks is very frequent among the Latin authors, especially Columella *De Re Rust.* lib. ix. 1, 2, 6, 4; Varro, lib. i. 14, 4; Pliny, *Hist. Nat.* lib. vii. 67, xxxv. 48, 49; and Vitruvius, particularly lib. i. cap. 5, lib. ii. cap. 8; who also, lib. ii. cap. 3, devotes an entire chapter to this subject;" also "Palladius, apud Scriptores, *Rei Rusticæ.*" The bricks of the Romans, and, no doubt, those of the Greeks also, closely resembled our tiles, being flat and hard burnt, and ordinarily of a red colour; Egyptian and Babylonian bricks resemble more closely those in common use in our own country, both in their proportions and in colour, being frequently pale.

Some of the largest masses now remaining of Roman work, executed entirely in bricks, are to be seen at Rome on the Palatine Hill, and in the ruins of the Baths of Caracalla; but the most ordinary manner of employing bricks in Roman work was not to build with them alone, but to introduce them in bonding courses, alternating with courses of loose rubble work, and as voussoirs in turning arches over openings, or in relieving arches

* The above article is taken from a very useful volume just published under the superintendence of Mr. Bennett Woodcroft, of the Great Seal Patent Office, entitled, "Abridgements of the Specifications relating to Bricks and Tiles," and printed by order of the Commissioners of Patents. Price 4s.

instances of this are universally visible in Roman remains, now that the masonry or cement with which such walls were most frequently intended to be faced has fallen away or been removed. During the Empire, the Romans often built walls of rough masonry faced with small hewn blocks, alternating with beds of brickwork, and in this description of work the brickwork was always intended to remain visible.

Roofing tiles were used (Smith's Dict. Antiquities, art. "Tegula"), both by the Greeks and the Romans; the Greeks having replaced those of burnt clay with tiles of marble in their most important buildings. Roofing tiles, and also gutters with ornamental heads for the discharge of the water, and ornaments to cover the junction of the courses of tiles, have been found at Pompeii, executed in terra-cotta, and of beautiful design and workmanship. Similar ornamental tiles have also been discovered among the ruins of the temples at Paestum. Portions of red tile are found along with the marble in the mosaic pavements at Pompeii. Tiles, similar to those now employed for drain-tiles, are found in the Roman baths, built into the solid walls, where they served as channels for the conveyance of water, and possibly also of hot air.

The bricks in common use in Italy at the present day are identical in appearance with those of the Roman remains, and are used in the same way, the manufacture of them and mode of laying having alike remained unchanged. In the plains of Lombardy, however, a rich series of mediæval buildings in ornamental brickwork are found, and in other parts of Italy many examples exist of the use of brick in the middle ages, not as a groundwork to be covered with a face of some other substance, as was the custom of the Romans, but as itself the sole or principal material seen. The Campanile di St. Antonio at Padua of the thirteenth century, the Fero Dei Mercanti at Bologna, built at the end of the same century, the church of Santa Maria in Strata, at Monza, of the fourteenth, the Ospedale Maggiore, at Milan, and the Certosa at Pavia, of the fifteenth century, and the choir of the church of Sta. Maria delle Grazie at Milan, by Bramanti, at the end of the same century, may be named as the most considerable examples of Italian ornamental brickwork, though numerous specimens may be found in Pisa, Sienna, Ferrara, Pavia, Venice, Ravenna, Bologna, and Rome. The manufacture and use of ornamental bricks is carried on at the present day in and around Milan, with considerable success.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.

A MEETING of this Society was held on Thursday at the Architectural Galleries; Mr. TIDY in the chair.

Mr. F. Y. HURLSTONE delivered a lecture on Art in Spain, in connection with a series of lectures by Mr. Otley and Mr. Stewart, on Art in Italy, Germany, and Holland. Mr. Hurlstone remarked that the lectures of those gentlemen were exclusively confined to the modern school of art, but he proposed to lecture on the ancient school of Spanish art. He had no drawings to illustrate his lecture, and some of the finest productions of the Spanish masters had never been engraved. Though the Spanish school was scarcely known in this country, yet in no nation was the national art a more complete reflex of its social character than in Spain. The lecturer proceeded to remark that in the eighth century the Arabs conquered the whole of Spain, except the mountainous region of the Asturias, the cradle of the future Spanish nation, and the inhabitants of which effected the reconquest of the country, which led to the expulsion of the Moors. Spain, like Italy, worshipped her Madonna and Child, and six centuries of what might be called a religious war gave to the religion of the Spanish nation an austerity unknown at that time in Italy, and which stamped its impress on the art of Spain. The Spanish were very much opposed to painting figures nude, or even of having limbs, especially those of the Blessed Virgin, uncovered. The lecturer, after stating that the works of the earliest Spanish painters for the most part perished, referred to the productions of some of the artists who flourished in the time of Ferdinand and Isabella, and regretted that there was no authentic portrait of the great navigator Columbus. He next alluded in terms of eulogy to the Palladian palace of Charles V., at Granada, by Machuca, a structure of which the Spanish were justly proud. The close of the reign of Charles V. brought to an end the classical school of art, and in the reign of his successor, Philip II., arose the school expressive of the national taste and feeling in Spain. After alluding to a number of the principal artists at that period, the lecturer remarked, that from the time of the erection of the beautiful palace of the Escorial by Herera, painting in Spain divided itself into three schools, those of Valencia, Castile, and Andalusia, and proceeded to give some particulars respecting some of the principal painters of those schools, with notices of their works and the peculiarities of their characters. Painted sculpture was an art peculiar to Spain; it was an art totally distinct and apart from sculpture, as we understood it from the great works of the Greeks. He had seen works in painted sculpture which, for grandeur of composition, intensity of pathetic expression, and depth of tone and colour, were remarkable productions and full of impressiveness. That was a department of Spanish art which was not known in this country. And even after the period of greatness in art had passed away, pieces of this peculiar kind of artistic production might be seen in many small figures in Spain. In the time of Philip IV. the national art was swept away, but there was a revival of it at the present day, evidence of which might be seen in the works of Spanish painters at the Great International Exhibition.

The CHAIRMAN wished to know whether what Mr. Hurlstone described

as the painted sculpture of Spain was painted or stained, as the difficulty in his mind was how the effect was produced upon the grey of the flesh.

Mr. HURLSTONE.—The sculpture of Spain was painted with a very considerable body of colouring and several coats, but he could not tell how the effect was produced on the grey. The painted sculpture of Spain was not the same art as the sculpture of the Greeks; it was a style of art totally foreign to what was understood by sculpture, which was simple beauty; but the painted sculpture of Spain was expression of character and of all the qualities which painting possessed.

A MEMBER asked if this painted sculpture was in *bas relief* or in separate figures?

Mr. HURLSTONE said, painted sculpture was for the most part in separate figures, but there were some *bas reliefs* in that style of art; it was very seldom there were *bas reliefs*, the art being almost confined to round figures.

In answer to a question put by Mr. ATKINSON, Mr. HURLSTONE stated that the great sculptors of Spain always coloured their own sculpture. In the great period of art in Spain many of the artists were sculptors, painters, and architects. The painted carving was always in wood, but the paint was laid on so thick that it would not matter whether it was wood, terra-cotta, or marble.

A MEMBER thought it was a question whether wood-carving was sculpture at all.

Mr. HURLSTONE.—Painted sculpture could not be considered as sculpture in the ordinary acceptance of the term, the end of which was the production of beauty. He hardly thought that painted sculpture could be considered the same art as sculpture, but rather that it was a new art peculiar to Spain.

The CHAIRMAN did not see why the beautiful effect produced on wood should not be produced on marble, as Gibson tinted his figures and toned his draperies.

Mr. HURLSTONE.—What Gibson did was not colouring, it was only toning; he gave a slight touch of blue in the eyes, but he could not make black eyes. In 1847, when he (Mr. Hurlstone) was going to Spain, he received a commission from the English government to purchase some specimens of the painted sculpture of Spain for the South Kensington Museum; but after going over Spain he found it impossible to purchase a single specimen worth having, though he met with a vast amount of trash which was called painted sculpture. The fine specimens were not to be purchased.

Mr. ATKINSON.—Was painted sculpture to be found in private houses?

Mr. HURLSTONE answered, that he had frequently found specimens of painted sculpture in private houses, but there were very few fine specimens in private possession, as they were chiefly to be found in public buildings and convents.

A vote of thanks to Mr. Hurlstone closed the proceedings.

LONDON AND MIDDLESEX ARCHÆOLOGICAL SOCIETY.

THE seventh annual general meeting of the members of the London and Middlesex Archæological Society was held at the rooms of the Institution, St. Mildred's Court, Poultry, the other day; Mr. J. B. BUTTERWORTH, F.S.A., in the chair.

Mr. HENRY W. SASS, hon. sec., read the report, which stated that the Council had much pleasure in meeting the members of the Society at the termination of the seventh year of its existence, and had to report that since the last meeting the Society had lost by death 6 of its members, and 8 had retired, but those had been more than replaced by the election of more than 32 members. The present number of members was 350. Since the last annual meeting the fourth part of the transactions of the Society has been published, and is in the hands of the members. The fifth part is in course of preparation. Public meetings of the Society were held on July 2, 1861, at the church of Austin Friars, which was described by the Rev. Thomas Hugo, and Sion College, where the Rev. W. H. Milman, librarian of the College, gave an account of the library, &c. In the afternoon of the same day the members inspected the buildings and monuments of the Honourable Artillery Company, and dined in their hall. On August 23, 1861, the Society held meetings at the town of Uxbridge, Harefield Church, Ruilip Church, an ancient preceptory of Knights Templars, and Swateleys Hall, the seat of T. T. Clarke, Esq. During the day the church of Denham in Buckinghamshire was likewise visited, on the kind invitation of the Rev. C. Hall. Papers were read at the churches and other places of interest. On April 28, 1862, the Society visited the churches of All Hallows, Barking, St. Olave's, Hart Street, and St. Dunstan's-in-the-East. On this occasion the Bakers' Company kindly gave the use of their commodious hall to the members, and presented for their inspection a number of charters, books, and pieces of gold and silver plate. A large party of the members and their friends dined in the Bakers' Hall in the evening. The council suggested to the meeting the propriety of charging all new members with an entrance fee of 10s. This they thought desirable for the purpose of adding to the small revenue of the Society, as well as obtaining some consideration for participation in the property which the Society had accumulated. From the financial statement, it appeared, that after payment of the expenses of the year, there remained a balance in favour of the Society of £35 1s. 11d. The report and balance-sheet were received and adopted, and votes of thanks were passed to the President, Vice-presidents, Council, and Mr. HENRY W. SASS, hon. sec., for their services during the year.

A letter was read from Lord TALBOT MALAHIDE, accepting the office of President for the ensuing year. The retiring Vice-Presidents were re-elected, with the addition of Mr. Alderman Finnis; the retiring mem-

bers of the council were re-elected with the addition of Messrs. J. G. Waller and J. E. Gardner; Mr. H. W. Sass was re-elected hon. sec. for the ensuing year. After the usual compliment to the chairman, the meeting separated.

ST. ANDREW'S CHURCH, LEICESTER.

ON February 28th last, we gave a description of this church, which we illustrate on the opposite page this week. The following are the principal facts contained in our description in the number referred to:—This church was erected from designs by Mr. G. G. Scott, and has been built by Messrs. Osborn Brothers, of Leicester. The ground plan of the building is cruciform, and consists of nave, transepts, and chancel with semicircular apse. It is built in the Early English style, almost entirely of brick, slightly relieved with Bath stone, which is introduced in the arches, the window sills, the weatherings of buttresses, the arcade round the exterior of the apse, and in various other parts of the building. The exterior is principally of red brick, ornamented with blue. The gables are coped with brick, with stone springers. The roofs are covered with Swithland slates, in diminishing courses. The two principal entrances are through a door at the west end and a porch on the south side; and there is also an entrance for children in the north transept. The view presented on entering the church at the west door is good, the rich soft colour of the bricks with which the walls are faced, and the lofty arches which divide the nave from the chancel and transepts, together with the complicated timbers of the roof, adding much to the general effect. Owing to the absence of pillars, the altar and pulpit can be seen from every part of the building. The nave is covered with an open-timbered roof of one span, the ridge of which is about 60 feet above the level of the floor. The principals, which are seven in number, form double arches across the nave, each arch with two parallel circular braces bolted together, the spaces being filled in with light cross braces to form a diamond pattern. These principals spring from shafts at the height of about 12 feet from the floor line. The roofs over the transepts are cross-braced. Wrought boarding covers the whole, and the timbers throughout have been stained and varnished. The nave is seated with open stalls of stained and varnished deal. The transepts are seated with movable benches. The stalls in the chancel are of more elaborate design. The church affords accommodation for about 960 persons. Provision is made for an organ in a chamber over the vestry. The pulpit, on the north side of the chancel arch, has a stone base, formed of a cluster of small octagonal shafts, encircling the centre pillar. The upper part is of deal, carved with a simple ornament. The font is plain, and harmonises with the general character of the church. The floor is laid with red and black Staffordshire tiles, in various patterns. The windows are glazed with cathedral glass, the circles in the upper portion of the nave windows being filled with ornamental designs. The chancel is lighted by a corona, by Skidmore, of Coventry, who has also supplied the standards in the nave, and the small corona which lights each transept. The entire cost of the building is, we believe, about £5,000.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary general meeting of this body was held on Monday evening, at the rooms of the Institute, Conduit Street, Mr. ARTHUR ASHMETEL, V.P., in the Chair.

Mr. PENROSE, honorary secretary for foreign correspondence, and Mr. CHARLES F. HAYWARD, honorary secretary, announced a number of donations to the Library of the Institute. They included the second volume (presented by the Secretary of State for India) of "India and High Asia," by Hermann, Adolphe, and Robert de Schlagintweit, illustrated by large plates, maps, and views.

Mr. JOHN HENRY PARKER, of Oxford, was unanimously elected an honorary member of the Institute.

The CHAIRMAN said, Mr. Parker intended to dedicate the remainder of his life to the development of architecture and archæology, wherever they could be found, for the accomplishment of which he had time and ample means at his disposal.

The Architecture of India.—Mr. WILLIAM SIMPSON then read a paper "On the Architecture of India," which will be found referred to in another column. The paper was accompanied by a large number of well-executed drawings in frames, made by the lecturer while visiting as an artist the various buildings in India of which they were illustrations, as well as specimens of red and other stone used in India, and inlaid work comprising precious stones.

Mr. DIGBY WYATT suggested that some committee, or the existing authorities of the Institute, should make arrangements by which a better illumination should be thrown on drawings which lecturers took the trouble of preparing and bringing with them for the illustration of their papers. It must ever be a source of interest to make enquiries into the details of the different styles of architecture in India. In the very earliest monuments of Indian architecture they found the three sister arts of architecture, painting, and sculpture united. In the north-west of India, particularly in the provinces which lay in the line of march of Alexander the Great, there were more traces of classical art. The more ancient the sculpture in India, as a general rule, it was certainly the better. And he would invite architects to study the monuments to be found in the Museum of the Council of State for India, to which had lately been added quantities of sculpture from India, representing styles of sculpture and of stone-carving of almost all periods, and relating to many of the localities of that interesting country. In the library of the Council of State for India were to be found many important combinations of Indian art, and in it would be found many materials which would reward the investigations of the architect and the artist. He thought that Mr. Simpson was entitled to honour at their hands for having as an artist shown, as he had done that evening, the interest he took in the art of architecture.

Mr. J. FERGUSSON said, there was not a building the lecturer mentioned that night which he (Mr. Fergusson) had not seen, and all Mr. Simpson had said

that night, and illustrated by his drawings, confirmed all he (Mr. Fergusson) had ever said or ever drawn.

Mr. CHARLES F. HAYWARD said, it should be known that Mr. Simpson had studied and illustrated wooden architecture.

The CHAIRMAN would be glad if Mr. Simpson would favour the Institute with a paper on wooden architecture, which, of course, they could not expect until the next session.

Mr. SIMPSON said what he knew of wooden architecture might be made the subject of a paper. He was glad to find that the paper read that evening had excited some interest, for he did not think the architecture of India was known as it ought to be.

The CHAIRMAN thought it would be important to notice the way in which wooden architecture acted and reacted on stone construction, and a paper on wooden architecture would no doubt be of great interest.

Mr. SIMPSON said some account of the wooden architecture of the Himalayas would show how it acted and reacted on stone construction.

Mr. J. W. PAPWORTH asked Mr. Fergusson at what time he supposed there disappeared in the architecture of India, that extreme relationship between Greek and Hindoo art, which had been referred to by Mr. Digby Wyatt?

Mr. FERGUSSON.—So far as he knew, there was not a single stone building or a single carving, which was anterior to the time of Alexander the Great. There was then a very strong Greek ornamentation in Indian architecture, which continued to the Christian era. His opinion was that the Greek influence began with the time of Alexander the Great, and died out at the Christian era.

Mr. BURNELL did not think it was possible any person could understand the phases of Indian architecture without following the history of the Indian religions.

Mr. DIGBY WYATT thought, that in the succession of religions, there was a difference found in the character of the sculpture.

Mr. FERGUSSON.—So far as he knew, there was not a single stone building anterior to the time of Alexander the Great, the buildings previous to that being made of wood. As to the effect of religion on the architecture of India, he remarked that pure Brahminical worship was not a temple worship, but a domestic worship, and that explained why temples were not used for that worship, which was a pure, unceremonial one. But the Bhuddist religion became a religion of the state, and temples were built. It was not until the time of Alexander wooden structures were turned into stone ones.

After some further discussion, a vote of thanks to Mr. Simpson was carried by acclamation, and the meeting separated.

METROPOLITAN BOARD OF WORKS.

A meeting of this body was held at the offices, Spring Gardens, on Friday last; Mr. WILLIAM TITE, M.P., in the Chair.

The cash statement showed a general balance in favour of the Board of £160,380 18s. 10d., in addition to £69,892 5s. 11d. invested in the New 3 per cent Annuities, for repayment of mortgage debts.

Proposed Visit of both Houses of Parliament to the Main Drainage Works.—Mr. DOULTON, M.P., said the Chairman of the Board, Mr. Thwaites, before leaving town for the benefit of his health, informed him that there were many members of Parliament who were desirous of visiting the Main Drainage Works, for the purpose of seeing what was going on there, and he thought it was very advisable that the utmost facility should be given to members of both Houses of the Legislature to inspect the gigantic Main Drainage Works. Although he had not given notice of motion, he hoped the Board would allow him to move "That it be referred to the Main Drainage Committee to make such arrangements as may be necessary for the accommodation of members of both Houses of Parliament on a visit to the Main Drainage Works."

Mr. D'INFANGER seconded the motion.

Mr. DEBNER approved of the motion, but inasmuch as certain expenses necessarily attended such visits, the visits of the members of Parliament and of the members of the Board, should take place simultaneously.

Mr. FREEMAN considered it to be of the utmost importance at the present time that members of Parliament should know what were the Main Drainage Works carried on by the Board. There were several bills before Parliament affecting the Board, and it was very desirable that the members of the Legislature should know what the Board was doing.

Mr. HENRY LOWMAN TAYLOR was of opinion that it was very desirable the members of Parliament should see the Main Drainage Works, but the members of the Board should not be excluded from going with them.

The motion of Mr. Doulton was unanimously agreed to.

The Main Drainage Committee made the following recommendations:—

"That during the absence of the Chairman of the Board, a Chairman be elected on every Friday, or other Board day, from the members present at the meeting of the Board."—Agreed to.

"That each Committee be directed to select, at their next meeting, from their number, a Chairman and Vice-chairman, who shall so act, during the pleasure of the Committee."—Agreed to.

"That during the absence of the Chairman, W. H. Dalton, Esq., be authorised to countersign cheques in lieu of the Chairman, and be requested to attend on the occasion of every payment made at the Office, for the purpose of handing over the cheque to the party entitled to receive the same; and that, with this exception, the present regulations with respect to the drawing of cheques and mode of payment be continued."—Agreed to.

"That during the absence of the Chairman, the Clerk of the Board do countersign the documents signifying the approval of the Board to applications for special buildings under the Metropolitan Building Act, for the formation of streets, &c."—Agreed to.

The ordinary routine business having been disposed of, the Board adjourned.

CHURCH, CHAPEL, SCHOOL, AND OTHER BUILDINGS.

NOTTINGHAM.—The beautiful little chapel in Shakespeare-street, Nottingham, which was built a few years ago for the Wesleyan Reformers, has recently been undergoing considerable enlargement and alterations under the direction of Mr. Thomas Simpson, the architect of the building. The chapel, which was originally built to accommodate 700 people, was found equal to the wants of the congregation up to the time of the last visit of the Rev. J. Caughey, when it was found utterly inadequate to the accommodation of the multitudes who were anxious to benefit by his ministrations, and who crowded to the chapel every night, but many of whom were unable to obtain admission, owing to the limited space at command. At that time there was only a small organ gallery at the end of the chapel facing the platform, and it was suggested that the erection of galleries round the building would afford the additional accommodation required, without incurring any great expenditure. Mr. Simpson was consulted on the matter, and eventually Mr. John England, builder, was entrusted with the carrying out of that gentleman's designs. The principal feature in the additions which have been effected is the construction of a gallery which

ST. ANDREW'S CHURCH, LEICESTER.-(See BUILDING NEWS, Feb 28 1872.)

extends round the whole of the chapel, affording additional seat accommodation for 500 people, and so contrived that the preacher can be seen from every seat in the chapel. The organ has been removed to the gallery behind the minister's platform, and the columns supporting the galleries, and the ornamentation round the front, are in excellent keeping with the general style of the building. The symmetry of the whole has been admirably preserved, and the beautiful manner in which the gallery front has been treated, with tasteful scroll-work and *basso relievo* on the red ground, as well as the elegant design and chaste colouring of the organ-case, add much to the general effect. In addition to the gallery, the convenience of the congregation will be promoted by several alterations effected at the back of the chapel, especially by the opening of two additional entrances which will greatly facilitate ingress and egress. A vestry room has been added, and the kitchen conveniences below have been considerably extended—a point of some importance, and the advantages of which will be felt on the occasions of tea-parties and other social gatherings of the congregation. The symmetry of the building has been preserved intact; and when the painting and decoration are completed, it will be, as a chapel, a model of compactness and good taste. The cost of the alterations amounts to between £500 and £600. The chapel has been formally re-opened, and on the occasion of the opening services attended by crowded congregations. (*Abridged from a Nottingham Paper.*)

EXETER.—About twelve months since, the commodious place of worship known as Bartholomew Baptist Chapel, at Exeter, was in so dilapidated a condition that it was deemed absolutely necessary, for the comfort and even for the safety of the parishioners, to renovate it. This was done, and amongst other repairs a new roof was placed upon the building, by which was incurred a debt of about £20. That small sum remains unpaid, the deacons, owing to the limited income derived from the chapel, not being in a position to liquidate it. With the view of getting rid of the burden, a tea-party and social evening meeting is to be held in the Methodist Free Church, Northernhay.

ROTHERHAM.—A public meeting, convened by the vicar, the Rev. R. Mosley, has been held in the Court House, Rotherham, to consider the propriety and desirability of abolishing the pews and adopting free sittings in the parish church of that town. The Rev. Vicar, in opening the proceedings of the meeting, stated that they had a large and beautiful church, surrounded by a numerous population, and yet they knew that the sacred edifice was not filled, nor anything like it, on the Sabbath. All the pews were engaged, except one or two, where persons could neither see nor hear, and yet while so small a congregation attended on Sunday, there were numbers without who would attend if they could secure seats. He wished the meeting to know that the patron and the archbishop of the diocese were in favour of the scheme. Mr. Churchwarden Parker spoke at length on the advantages of free seats and voluntary weekly offerings, and concluded his address by moving a resolution to the effect, "That a committee be appointed with instructions to consider, and report to an adjourned meeting, the propriety of making arrangements for the free use in common of the pews in the parish church by all the parishioners, as the law required." The motion having been seconded, Mr. Percy Smith submitted a series of resolutions in opposition to the system of free sittings, but ultimately withdrew them until the next meeting, as Mr. Parker's motion was only meant to be a preliminary step. The motion of Mr. Parker was then agreed to, and the meeting adjourned.

DUBLIN.—His Excellency the Earl of Carlisle, K.G., Lord Lieutenant of Ireland, received on Monday a deputation from the building committee of St. Andrew's Church, Dublin, consisting of the Rev. C. E. Tisdall, D.D., Rev. E. Seymour, Mr. Manning, Mr. Pettigrew, Mr. Wisheart, and Mr. Acheson, hon. sec. Mr. Acheson stated that the object of the deputation was to request His Excellency to honour the committee by laying the foundation stone of the new church, in which he had taken so great an interest, and in aid of the funds of which he had so liberally subscribed. The Lord Lieutenant was pleased at once to accede to the request. We understand that a letter has been received by the hon. sec. from a gentleman residing at Chapelizod, making the munificent offer of £1,000 towards the building fund, provided the remainder of the sum required for the erection of the church be subscribed. The sum of £3,000 is now all that is required for carrying out the original plans, and of this sum the generous donor referred to offers to give £1,000, provided the remaining £2,000 be subscribed, and we have no doubt that that sum will soon be realised.

GENERAL NEWS.

ARCHITECTURAL EXHIBITION.—A lecture was delivered on Tuesday evening at the Architectural Exhibition, Conduit Street, Regent Street, on "Pagan Architecture," by Mr. WILLIAM BURGESS, before a numerous audience.

The next annual meeting of the Archaeological Institute will take place at Worcester, commencing Tuesday, July 22nd, and terminating Tuesday, July 29th. Lord Lyttleton will preside on the occasion.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—On Wednesday evening the fourth *conversazione* of the season of this spirited society, was held at the Gallery of the Society of British Artists, Suffolk Street, Pall Mall. The performances of the musical artists, of whom Mr. Benedict and Mr. Alfred Gilbert were conductors, were of the highest order, and the proceedings of the evening afforded much pleasure to a very numerous assemblage of ladies and gentlemen.

THE LATE FIRE IN JAMAICA.—An English fire office has paid £3,600 for losses sustained, owing to the great fire in Jamaica, and property in that island was immediately insured in the same office to the amount of £40,000.

THE PROPOSED MEMORIAL TO THE LATE PRINCE CONSORT.—The recommendation of her Majesty the Queen to refer to the principal architects of the day for their opinion as to the nature of the proposed memorial to the late Prince Consort has been carried out, and her Majesty's committee has appointed the following gentlemen:—Mr. William Tite, F.R.S., M.P.,

President of the Royal Institute of British Architects; Professor Donaldson; Professor Smirke, R.A.; Mr. George Gilbert Scott, R.A.; Mr. Pennethorne, Mr. P. Hardwick, Junr., and Mr. Matthew Digby Wyatt. There seems to be a growing feeling in the literary and scientific world to unite the proposed memorial with some scientific or literary institution.

PRESTON NEW TOWN HALL.—A special meeting of the Corporation of Preston was to be held yesterday (Thursday) to decide upon a proposition that a memorial be presented to her Majesty, soliciting her sanction to an application being made to the Prince of Wales, asking his Royal Highness to visit Preston during the Guild week to lay the foundation stone of the New Town Hall.

DESTRUCTIVE FIRE AT QUEEN'S COLLEGE, CORK.—On Thursday morning the western wing of the Queen's College, Cork, was completely destroyed by fire, and it is estimated that the damage amounts to £12,000. The fire is supposed to have been the fiendish work of an incendiary.

IMPORTANT BLASTING OPERATIONS.—In consequence of the large demand for limestone for supplying the ironworks in South and North Staffordshire, it has become necessary at the Cauldon Low Quarries, belonging to the North Staffordshire Railway Company, occasionally to use large blasts of powder, with the view of obtaining a greater supply of the stone than it has been possible to obtain in the usual way of quarrying by the wedge, hammer, lever, and small blasts. This has led to an experiment on a very large scale, when 30 cwt. of powder was used for a single blast. In carrying out the experiment, a gallery was driven in 50 feet from the face of the rock, which at this particular point was about 130 feet high. At the end of the gallery was constructed a chamber, in which was deposited the powder, being nearly on a level with the external surface of the quarry, and the line of "least resistance" being ten feet. The object was to blow out the bottom by giving a moderate preponderance to the powder over the superincumbent mass to be moved. The object sought was fully attained. About 25,000 tons of stone were brought down in good working condition.

IMPROVEMENT OF ODESSA.—Letters from Odessa state that the municipal authorities have at length resolved upon paving and draining the streets, and from a number of native and foreign competitors for the contract have selected Mr. G. Furness, the contractor for the Great Outfall Works at West Ham, in connexion with the metropolitan drainage, and who was represented in Odessa by Mr. Bayliss, the same contractor's engineer for the Pernambuco Railway. The works at present contracted for are estimated to cost £800,000, but it is expected that the Municipality will ultimately expend on works of improvement upwards of £1,500,000. Contrary to popular belief elsewhere as to the venality of Russian officials, it is affirmed that this contract has been obtained openly, without an official *douceur* or bribe of any kind.

MEMORIALS TO THE LATE REV. JOHN HAMPDEN GURNEY.—At a meeting of the memorial committee for the purpose of selecting designs for two memorials, about to be erected by public subscription—one in St. Mary's Church, Bryanston Square, of which the deceased gentleman was rector, and the other in St. Luke's, Nufford Place, St. Marylebone—those by Mr. E. J. Physick, sculptor, were unanimously adopted, and the commission has been given for their immediate commencement.

THE DIRECTORS OF THE BRIGHTON HOTEL COMPANY intend to proceed with the erection of the hotel with all possible expedition.

THE EWART INSTITUTE AT NEWTON-STEWART.—The foundation-stone of this beautiful building was laid at Newton-Stewart on Friday afternoon last, the 16th instant. This institution has been founded, and endowed to the extent of upwards of £10,000, by the munificence of the late Mr. James Ewart, of this town; and its objects, in the first instance, are the maintenance, education, and upbringing of children on principles similar to those observed in Ragged Schools. The day was beautiful, and the scenery, as visible from the Institute, could scarcely be surpassed. The situation of the Institute is on the rising ground immediately to the west of Newton-Stewart, and commands a lovely and extensive view of Cairnmore—Kirkcubright and its beautiful grounds—the valley of Cumloiden—and the Minnigaff Hills. The building, which includes a school and dwelling-house, is after the ancient Gothic style; and with its buttresses and other substantial adornments is quite a novelty in, and adds a new feature to the architecture of the district. That part of the building appropriated for the school is, within walls, 36 feet in length, 21 in width, and surmounted at the south end by an elegant belfry 50 feet in height. The school, which is to be fitted up in the most modern style, has 5 large windows, one of them no less than 14 feet in height, by 12 in width. The height of the roof of the school is to be 38 feet inside. The dressings of the whole building are of beautifully cut and carved white freestone, and the walls are coursed with the finest blue whinstone. An elegant and massive porch adorns the entrance to the school. In regard to ventilation, prevention of damp, and the most modern improvements and requirements, neither skill, pains, nor expense has been, or apparently will be, spared. Immediately behind the house and school (which are attached) there is, besides other useful buildings, a fine bath and dressing-rooms attached. The bath is to be lighted by a plate-glass roof, and supplied with a constant inflow of the purest water. This bath is no less than 18 feet in length, 12 feet in width, and 4½ feet in depth; and, while something new in the district in connection with such an institution, its use must conduce largely to the health of the children attending the school. We believe that it is the intention of the Ewart Trustees to lower, by four feet or so, the south wall of the grounds on which the building stands, so as to afford a better view of that end of this handsome edifice, which contains the large window and surmounting belfry. When this has been done, the visitor will, standing

on the beautiful bowling-green of Newton-Stewart, have, beside the fine spire and church of Penninghame, a view at once of no less than three charitable and educational institutions—namely, the Infant School, the Ewart Institute, and the "Home."

AGRICULTURAL LABOURERS' COTTAGES.—Slowly but surely, says the *Scottish Farmer*, the small, rickety, damp, ill-lighted, and badly-ventilated dwellings of the agricultural labourers are disappearing, and in their stead are rising dwellings more in keeping with the increase of wealth and intelligence which a quarter of a century of agricultural prosperity have brought. Some districts have advanced much further in the good work than others. In the best there are, perhaps, not more than one half of the houses of farm-servants of that one-room type which a previous generation of farmers regarded as quite good enough for their men, and the men themselves did not object to on the score of want of comfort in any shape. In other districts, however, it is still rare to see a neat new cottage for ploughmen. The upper portion of Kirkcudbrightshire might be mentioned as one where as yet little has been done in the way of cottage accommodation. There we still find cottages built of dry stone, the walls differing from a dyke in no other way than in having some lime thrown in a slap-dash way in the interstices on the outside. Drainage there is none, notwithstanding which, the houses are often built in a hollow some feet beneath the road which runs in front of them, and, as the floors are composed of nothing but natural soil, they are in a very sloppy state in winter. A foot-square window is in many instances the only source of light, if we except the door, which, to prevent suffocation by smoke, is usually left open. Numerous houses have no grates, the peats being built up on the floor, beneath where a hole in the roof does—or rather we should say, is intended to, but does not—do duty as a chimney. As might be expected, the furniture of such houses is usually in keeping with the character of the accommodation they afford. A box-bed, and one composed of slabs from the saw mill; a chest or two for clothes, three or four stools, a couple of home-made chairs, and a clock of the description there known as a "wag-at-the-wa," are often all the pleasing. The inmates are not to blame, for any better would be sadly out of place, and glued articles would be destroyed in a week in such hovels. In these wretched dwellings there can be little or no real home comfort. The occupants, too, are not an ignorant class at all. There is no county in Scotland where education is so highly appreciated, the children beneath those miserable roofs receiving a good school instruction. Latin and French being often added to English in the case of boys. We doubt, however, whether the people are so fully alive to the miseries of their accommodation as their class in some other counties would be. We say this, because we find respectable tradesmen with a bit of land, a couple of cows and an account at the bank, living in houses with little more pretension to comfort. This is no valid excuse, however, for proprietors in Kirkcudbrightshire neglecting that which landlords in other counties are beginning to do. When we make a thorough inspection of the condition of the farm-servants in Kirkcudbrightshire—as we hope to be able to do during the summer or autumn—we trust we shall be able to report more favourably upon the county generally than concerning the small portion to which we paid a hasty visit the other day, and where we noticed no change within the last fifteen years, except, indeed, that some old houses had been knocked down and no new ones erected in their stead.

ST. PAUL'S CATHEDRAL.—The committee have made another appeal to the nation at large on behalf of the proposed completion of St. Paul's Cathedral.

ST. THOMAS'S HOSPITAL.—The question of what is to be done with St. Thomas's Hospital, and where it is to go to, has now become secondary to "what is to be done with the Patients?" The interests of these poor sufferers have already fallen to the ground between the two stools of Lewisham and the Surrey Gardens. The Treasurer and Committee have held out, without making other arrangements, in the expectation of some settlement with the Charing-cross Railway Company; but, as the latter require a rental of at least 5 per cent. on the money which the Hospital has cost them (£296,000, besides law expenses—no small item), and will not modify the demand, the Hospital authorities—who refuse to pay a rental which is equal to half their income—are at a nonplus what to do with their patients, as the premises must be cleared, and handed over to the Railway authorities, by the 26th of July. An encampment of huts and temporary sheds in Lock's-fields was spoken of at first, but the idea has been laid aside on urgent remonstrance, and it is reported now that the patients are to be distributed among the Unendowed Hospitals on the other side of the river, a fixed sum being paid for board, lodging, and medical attendance. An objection has been urged to this arrangement that it may call an untoward attention to the distinction between Endowed and Unendowed Medical Institutions, and raise a scandal as to those who do so much for nothing and those who do so little for so much. It is not considered desirable to take any step that might not impossibly originate a commission for the management of Hospital funds, and a more equitable distribution of them, in pursuance of their founder's intentions, on the plan of the Ecclesiastical Commission. St. Thomas's Hospital is largely under the control of the Lord Mayor and Corporation of London. Surely some better method, or rather a method of some kind, in its management ought to be at once adopted. Might not an appeal to the Charity Commissioners be of service? Surely the Attorney-General, if called upon, would move in so important a matter.—*Communicated.*

FAREHAM WATER SUPPLY.—A complete system of drainage and water supply to this town has been completed, comprising large deodorising tanks,

reservoir, &c., about five and a half miles of sewer, and six miles of water main. The supply of water is from two large wells, at the Fareham end of Portsdown Hill, forced into the reservoir by two 15-horse engines. The private drainage and water-service connections have been laid on to about 600 houses; and in the course of six months, the whole of the houses in the town will be completed in a similar way. Previous to the completion of the drainage, many of the houses of this town were really unfit for habitation. The whole of the work has been designed and carried out under my directions.—*T. Buckham.*

CHURCH, CHAPEL, ETC. INTELLIGENCE.

WORCESTER.—A new district church for St. Martin's, Worcester, is about to be erected, from designs by Mr. Hopkins, architect to the Worcester Church Extension Society. The edifice will be of the middle-pointed or decorated style, and consists of a chancel, terminating in a three-sided apse; north and south transepts, each having an eastern aisle, which also communicates with the chancel by an arch; nave, south aisle; and cloister porch, extending across the west end of the church, and connecting it with the tower, which stands detached, a little to the south of the nave. This cloister will form an effective feature, and at the same time be practically useful in keeping out the noise and dust incident to the contemplated position of the church, close to a much-frequented road. The tower is bold and massive, having angle buttresses and double belfry windows, above which rises a lofty well-proportioned broach spire, to the height of 180 feet. On each cardinal face near the base is a gabled lucarne or spire-light, above these is a band of gables; while still higher the outline is relieved by a sort of coronal encircling the spire. The nave is four bays in length, each containing a lofty two-light window. On the opposite side is the aisle, of three bays. At the west end, above the cloister, is a deeply-recessed pointed arch, enclosing a large wheel window; and at the intersection of the nave and transept roofs is an open bell turret. Each transept is lighted by two two-light windows, with a vesica-shaped opening in the gable. The north transept aisle will be appropriated for a vestry and organ chamber. It is intended to use the carved work, and as many of the timbers of the Guesten Hall roof as are sound enough for the purpose. The church will accommodate about 850 persons, and, if carried out according to the design, will form a striking feature in any general view of the city.

MR. SIMPSON'S LECTURE ON ARCHITECTURE IN INDIA.—We are compelled, by a pressure of matter, to postpone to our next the paper read by Mr. Simpson before the Royal Institute of British Architects, on Monday.

STATUE OF PRINCE ALBERT.—The model in clay of the statue of the Prince Consort, which is to be the munificent gift of the Mayor of Manchester to his fellow-citizens, is completed in the studio of Mr. Noble, Bruton Street, Berkeley Square. It presents a remarkably striking likeness of the lamented Prince, and the general treatment of the subject is excellent. H. R. H. is represented as wearing the robes of the Order of the Garter. On the front of the pedestal will be placed the inscription:—"Albert the Great and Good." At the back of the pedestal will be inscribed the words, "Presented by Thomas Goadsby to his fellow-citizens, A.D. MDCCCLXII." The statue is to be of the purest Carrara marble, and will be eight feet in height. It is hardly necessary to state that the funds received by public subscription are to be devoted to providing the pedestal and the protecting temple in which the statue is to be placed. The cost of the temple will be defrayed by the Mayor. As usual, the men of Manchester are up and doing, while others are debating about what shall be done.

ON THE LIFE OF WELBY PUGIN.*

THE name which he devised for his house was St. Marie's Grange. A grange, in Mediaeval language, was a manor-house, or farm-house of the day, belonging to a monastery. To give this name to the new dwelling was no affectation, as is frequently imagined, but a very appropriate act. He had just at that time professed himself a convert to the Roman Catholic church.

In mentioning this conversion I have touched what is the chief question of Pugin's biography: the key to his character, not only as a man, but as an artist and an art-reformer; and I venture to think, that perhaps no one has, as yet, answered the question so clearly as it might be answered,—not even Mr. Purcell, whose arguments in the appendix to Mr. Ferrey's memoir, must certainly be acknowledged to come very close to the mark. Mr. Ferrey, for instance, and others who are artists, seem to lose sight of the religious element of this question. Mr. Purcell, and others who are religionists, can scarcely be expected to introduce effectively the element of art. Both, however, affirm that he was an actual convert of conscience—a doctrinal convert from one creed to another creed. Others have supposed that, feeling no particular interest in either this or that creed as such, he preferred the Roman Catholic connection as matter of business.

These opinions I hope to show are both alike at variance with the character before us: the further story of his life is the evidence in point. I venture to affirm that he was a man incapable of the mercenary motive, but equally incapable of the doctrinal one. So highly do I estimate his artistic character; so thoroughly was he possessed, as I think, with the one idea therein implied; so exclusively absorbed in its contemplation, that I define his religion to have been simply Art—art-ritual, as it happened—and, consequently, Roman Catholic ritual; in other words, altogether apart from dogmas, doctrines, and confessions of faith; so essentially were his ideas identified with the mystical charms of artistic ritual, that, in the state of such ritual thirty years ago, he simply tendered his allegiance to that church which possessed the most. And

* See p. 349, ante.

we shall find before the end, that on the self-same principle, when time brought on its unexpected changes, so that there arose another ritual-church—a Protestant one—in rivalry with the old, he knew not which to prefer.

His own explanation confirms this theory to the full; and the simplicity of mind with which he states the question—his obliviousness to all doctrinal points—is most striking. He describes the views with which such services as those of Edward Irving had informed his youth. It was, he says, with such perverted feelings that he first became a student in *Ancient Art*. But the origin, intention, and use of all he beheld was perfectly unintelligible; till, applying himself to *liturgical knowledge*, what a new field was opened! He then discovered the fitness of the edifices for their rites; he saw the cold and heartless character of the reformed service; he read in old chronicles the crimes by which the new religion had been established, and so on; he opposed to all this the Catholic apostolical system of unchanged faith, sacraments, and ceremonies; and the result was, that he gladly surrendered his own fallible judgment, and embraced with heart and soul the faith and discipline of the ancient church.

No better exposition could be wished than this frank and unsophisticated avowal—frank, because the apologist was no Jesuit; unsophisticated, because he had no pretension, no desire to go beneath the fair and sunny surface on which floated the poetic mysteries of his adoration. "I gained my knowledge of the ancient faith," he says, "beneath the vaults of a Lincoln or a Westminster; and I found it indelibly marked in the venerable piles which cover the face of this land. This period of my life was one of great mental happiness." "An Englishman," he says again, "needs no controversial writings to lead him to the faith of his fathers. It is written on the wall, on the window, on the pavement, by the highway. The cross—the emblem of his hope—still surmounts spire and gable, still waves from the mast of the ship and over the palace towers." The symbols of Christian art he boldly pronounced to be of divine origin. Let this one principle be kept in sight, and it will be the key to the whole career of Pugin's adult life. To him art was nothing without religion, religion nothing without art. His notion of the middle ages was, that this was their universal rule. How far he was right may be matter of opinion; but, in considering that the rule was allowed no application now, his accuracy cannot be questioned. For my own part, I fervently hope that the rule may never again prevail; but I cannot withhold my tribute of admiration from the man whose mind was filled like his with an idea, however illusory, so poetically grand; and my estimate of Pugin is this,—that I know of no other man in architecture who ever unaffectedly embraced the sentiment.

It soon became widely known that the great Gothic artist, dwelling in his quaint Gothic house at Salisbury, had attached himself enthusiastically to the Gothic church. People who had a little insight into the human heart's odd corners hardly smiled—certainly did not wonder; it was all so perfectly appropriate, they said, although they could scarcely tell you why. At this time he was only three-and-twenty; but the Catholic connection speedily and effectually gathered round him, and it was understood that he was really getting into extensive practice.

Emboldened by this success, he now issued a new and most novel work. It was published by the author at St. Marie's Grange: the book-trade had declined to concern themselves with it. This was the famous "Contrasts; or, a Parallel between the Architecture of the Fifteenth and Nineteenth Centuries." It is a book that everyone interested in architecture should examine, for both curiosity and profit. The written argument is simple. The Reformation, the author would say, in overthrowing the Mediæval church, overthrew Mediæval art, which was identified with the church. Protestantism had done nothing since but "horrible repairs," to use his own words, "alterations and demolitions, directed by a tepid and parsimonious clergy, brutal and jobbing parochial authorities, and ignorant and tasteless operatives." Modern Classic edifices were but infamous Pagan caricatures; fitness was the test of sound design; real old Gothic work was the only art that would bear this test; it was Christian art; and it was finally and emphatically Roman Catholic art. Beyond a doubt, to a certain extent, this was correct criticism; and if expressed in a temperate manner, it might have been widely, if not universally, accepted. But it was not temperately expressed; indeed, beyond all precedent the reverse; exaggerated even to such a degree as to lose its very power. The real strength of the essay, however, lay elsewhere: a long series of most clever etchings formed the "contrasts;" and these certainly produced a sensation. After two or three rather weak and over-shot witticisms of delineation at the commencement, he presents, not always honestly, but always most adroitly, one set after another of sketches in pairs. Each pair is formed, of course, on one hand by some example of Mediæval design carefully selected for its merits, and on the other by a corresponding specimen of modern design chosen with equal care for its demerits: his style of drawing, moreover, being all in favour of the more picturesque style. The opinion of almost everyone was, that these contrasts, although marvellously bold and telling, were in a great measure a failure, through the well-known error of proving too much. That there was great critical truth in them—much really sound comparison—the greatest enemies of his conclusions have always admitted; but the celebrated "contrasts," in a word, are a good deal over-contrasted.

Pugin was now no more than four-and-twenty; and the conscious power of genius which he displayed, not in architecture alone but in all kinds alike of Mediæval art, in spite of shortcomings (which tended, by-the-by, all to the side of power), has probably never been equalled in architectural design in the person of so young a man.

His career for the next five years, although full of successful labour, may be summed up in a very few sentences. His abilities in design, universally recognized, procured him a large practice; but his uncompromising adherence to Romanism kept it confined almost exclusively to the connection of that communion. At length he found Salisbury inconvenient head-quarters for business; sold St. Marie's Grange for the price of the ground; and in 1841 established his home at Chelsea, being then twenty-nine years of age, and at the very height of his success. Just before the beginning of these five years he had assisted Barry and Gillespie Graham upon their designs for the Houses of Parliament; but otherwise his work was independent, and soon plentiful. As regards literary endeavour, the five years which had opened with the publication of the "Contrasts" were to close with the issue of the equally celebrated "True Principles," he having written nothing of any moment in the interval. As for his habits of life, in spite of the vast amount of professional labour which he accomplished

(keeping no assistant, but drawing everything with his own hand), he could still spare time for a good deal of eccentric roaming. As when entering upon practice we saw him rushing from cathedral to cathedral, passionately worshipping the old, and heartily cursing the new; so now, when overwhelmed with engagements, we find him cruising in his yacht upon the open sea for days together, and occasionally running down the coasts of France and Holland. The merit of the "True Principles of Pointed or Christian Architecture," as the work was entitled, must be allowed to be superior to those of the "Contrasts." Five years of practical experience in life and business had made an improvement in the author. The book of 1836 was flippant in the extreme; it carried an exuberance of sail, and little ballast. The book of 1841 was less pretentious and more safe. The improvement, however, was not so great as in any ordinary case it ought to have been; Pugin was not by any means to be set down yet in the category of sober men. In spite of his subject being now almost purely abstract, he could not help launching out into occasional philippics as fierce to the full as the fire of his younger days could have made them. In spite of the reminiscences of five years of solid work, he could not refrain from exaggerations as weak as ever.

Pugin had not yet learnt that intelligent debate never condescends to deal with sorry misadventures, failures, and caricatures; but, grappling with an opponent's strongest and proudest, by efforts of still greater strength and greater pride, wrestles upon the highest ground at once. Again, the hasty and rude engravings of this work, badly shaded and even badly drawn, were discreditable to an artist who was held in such wide esteem. Nevertheless, the work was successful, and in that early day of modern Gothic, deserved to be so.

He lays down two indisputable but novel ideas: 1st. That a building ought to comprehend no features whatever except such as are necessary. 2nd. That all ornamentation ought to be formed by mere enrichment of construction. He pointed out that Greek forms of design being based on wooden structures, the artists of that day erred in using them in stone; whilst the first principle of Pointed architecture, on the other hand, is to disguise nothing and compromise nothing. The underlying sentiment of his life, devotion to artistic-idealism, is more fully developed than before. His prayer is that the church may again, as in days of old, cultivate the talents of her children, to the advancement of religion and the welfare of their own souls; for without such results talents are vain, and the greatest efforts of art sink to the level of abomination. He begins with sound philosophy, and ends with what in any other man we should call cant.

Some may feel inclined to ask whether I wish it to be understood that Welby Pugin now sold St. Marie's Grange for a mere song, and went to settle in a common twelve or fourteen roomed house at Chelsea, with two-inch deal ovolo sashes hung in deal-cased frames; and the hall and staircase papered Sienna marble, at twopence a yard, and varnished. It is impossible, you will say, after what we have heard. And so it would be. Pugin sold St. Marie's Grange, at Salisbury, only to build the Grange of St. Augustine's, at Ramsgate. He had tired of the one place, and taken a fancy to the other; but his Mediæval house he had not tired of, and he set to work to revive it forthwith. His stay at Chelsea was but a temporary measure. We are not now, it is true, dealing with the whims of youth; but the settled purposes of manhood are in this remarkable character still as strange, and, in their defiant consistency, still as original as ever.

The establishment which he now began to build may possibly have been at first projected within moderate limits; ultimately it came to include, besides a dwelling-house of much larger size than St. Marie's Grange, a church, schools, and conventual buildings, with complete appurtenances and characteristic detail. He spent in all £15,000; his operations were spread over ten years; and he left them incomplete after all. So soon, however, as the house was ready, he removed to it from Chelsea; and it was his home till his death.

Now, during these five years, from 1836 to 1841, from the "Contrasts" to the "Principles," what had been the progress of English architecture, and what the value of Welby Pugin therein? The state of professional opinion upon which the "Contrasts" fell in 1836 was through Eclecticism, as has been stated. The practical force of that work lay, not in any introduction of Gothic design, or any improvement in classification of style (for all that Pugin knew in these forms had been developed by others and was fully recognized), but in an exaltation of Gothic style to the prejudice of what was considered to be a sister style of equal esteem. The Christian, he argued, could have no fellowship with the Pagan, even in the profile of a moulding. There has been of late years a vast deal of this style of logic spoken and written—all borrowed plumage from Pugin; at that time he was the only man who hazarded such views, and everyone else pronounced him to be a monomaniac. I have the same opinion of him now; but I say that his monomania was so unaffected, so poetic, so exalted, as to lift it up to heaven. To understand the principles then prevalent, take Hosking's Essay on Architecture, in the "Encyclopedia Britannica," of date 1832, or the basis upon which the Royal Institute of Architects was established in 1834—1837. There were certain recognized styles of design, of various degrees of merit, but all equally entitled to claim critical authority under the rule of ancient precedent. The Classic styles of Greece and Rome came first. They were of superhuman origin; the only difference between them was, that the Greeks were as gods, the Romans as demigods. These were the grand styles. Italian examples of the Cinque-cento period were to be judiciously copied for municipal buildings; and English specimens of the Tudor and Elizabethan for domestic and educational works. For ecclesiastical works the examples of Mediæval England, as classified by Rickman, were to be copied in the same manner as those of other styles. There could be no reason, said the authorities, for ever disturbing this. The great controversy respecting the style to be used in the New Houses of Parliament in 1835—1836, was the expression of this condition of opinion: the argument was, on the one hand, that for so grand a work the Greek or Roman style was entitled to the preference; on the other, that for a building of such profound ancestral associations, the style ought rather to be Gothic or Elizabethan. The decision in favour of the latter sentiment was thought to be the triumph of feudal affectation in Parliament over refined Eclecticism in public. It was Pugin who first formally repudiated this happy-family arrangement of the Eclectics; and but for the error of exaggeration, the "Contrasts" would have done it more damage than they did.

There followed almost instantly upon Pugin's declaration the institution of a new doctrine, namely, Architectural Ecclesiasticism; the idea, that is to say, of searching out the mysticism of ancient church art—that which had been the very

foundation of Pugin's mission. Although Pugin would listen to no Ecclesiasticism out of the Romish Church, yet it was chiefly in the English Church, and particularly amongst the clergy, that his teaching struck root. And thus, as at the commencement of the five years which we have in hand, the standard of Ecclesiasticism had been raised against the rule of Eclecticism; the hand which did this being Pugin's alone. At the close of our five years this was the result.

The Camden Society of Cambridge was established for the promotion of Ritualism; the *Ecclesiologist* Journal was set on foot in the same cause. Pre-Raphaelitism and Puseyism we need only name; but all over England, and chiefly under the guidance of the clergy, there were being formed one after another of the local Archaeological Societies now so numerous; as part of the same act, church restoration was becoming universally fashionable; and, to end with an anti-climax for the sake of truth, and for the sake of justice to our hero's consistency, a few of the most earnest of his followers were embracing, like himself, and for the self-same reasons, the Romanist faith. Meanwhile, the Royal Exchange of London, and St. George's Hall of Liverpool, had been built as further examples of Classic art; and Gothic practice had attained that well-remembered stage of maturity which produced in 1842 the Camberwell Church of Mr. Scott, and shortly afterwards his proud competition church at Hamburg. Now, I do not claim for Welby Pugin the sole merit of all the progress here involved; but I cannot see why there should be denied to him the credit of having been, amongst many busy workers, at least the first and busiest; amongst many earnest thinkers the most earnest, if not always the most safe; amongst many enthusiasts the most enthusiastic; amongst many sublimated fanatics the most sublime. To argue that Pugin was not the leader of our present school of Gothic architects seems to me impossible; and for my own part I only wish his followers had followed him more closely, and kept more at home in England than they have done. I admire Gothic architecture more than I can admire recent specimens. If Pugin had lived till now, I cannot help thinking that one of his True Principles would have been this—that for English work English precedents must be the best; and if he had come to recognise Protestantism, that another would have run thus: that in Protestant churches the symbols and arrangements of Roman Catholic ritual must be necessarily out of place.

(To be concluded in our next.)

PUBLIC MONUMENTS.

THE Cross is the earliest and the most national of our public monuments. It dates from the first traditions of our island history in the "Suenos stone" near Forres, and the curious monuments which have been ably reproduced by the care of the Spalding Club in the "Sculptured Stones of Scotland." Four crosses still stand on the consecrated shores of Iona, where it is reported that 360 of these venerable monuments once marked spots dear to piety and affection. The large Iona cross in front of the cathedral is a monolith column of the hardest whin rock, 14 feet high, 18 inches broad, and 6 inches thick. It is fixed in a pedestal formed out of a massive block of red granite about 3 feet high. "The labour and art," says Mr. Graham, "of quarrying such a column, of transporting it to the island, and of carving and erecting it when it was brought, are circumstances really astonishing when one considers how inadequate the power and the skill of this part of the country would now be to such a work." It would seem that the practice of erecting these crosses lasted in Iona down to the Reformation, for that of Abbot Mackinnon, still standing, bears date as late as 1489. For monuments on a comparatively small scale, connected with the memory of the dead or with ecclesiastical associations, we know of nothing comparable in effect to these crosses, and their monolithic character gives them importance and extreme durability. But under the denomination "cross" we include not only these primeval monuments of a rude antiquity, but some of the most exquisite remains (alas! too few) of Gothic architecture. Most of the cathedrals had their "cross" in the precincts of the chapter-house: thus Paul's Cross was the scene of the great ecclesiastical debates of the Middle Ages and the Reformation, and also the Forum of the citizens of London—though indeed Paul's Cross had no claims to monumental beauty, if, as Strype states, it was merely "a pulpit cross of timber, mounted upon steps of stone, and covered with lead."

These mediæval crosses had not necessarily an ecclesiastical character. The Cross of Coventry, which was the most elegant and splendid fabric of the kind in England, was built in 1541 by a bequest from Sir William Holles to the city for municipal ornament. It was of a hexagonal shape, 57 feet high and 42 in circumference, decorated with the most elaborate tracery of the time: unhappily it was taken down by an "improving" corporation in 1776. The crosses of Cheddar, Malmesbury, and Chichester are small roofed buildings of the form which may also be seen in the curious, though not very pleasing, Royal Cross of Aberdeen.

The crosses which marked the transport of the body of Queen Eleanor from Hereby in Lincolnshire to Westminster, have all but disappeared: that which occupied the well-known site in the village of Charing (supposed by some to be derived from *chère Reine*), still lives in the name of the busiest thoroughfare of western London. The crosses of Geddington and Northampton (the Queen's Cross) are preserved, and the cross of Waltham, erected on the same melancholy occasion by the piety of Edward I., has recently been most skillfully restored. It is a hexagon, each side of the lower story divided into two arches, charged with the arms of England, Castle, Lion, and Pontifich: the puffed finials of the second story cover twelve open tabernacles, intersected by pillars, the niches being filled by

* Antiquities of Iona, p. 22.

† The reader interested in this subject will find an "Essay on Ancient Stone Crosses" of considerable interest, though by no means complete, in "Britton's Antiquities of Great Britain," vol. i. No. IV. Mr. Petrie's work on the "Round Towers of Ireland" contains the best notice we have seen on the ancient stone crosses of that island.

appropriate figures; and the third story rises in solid masonry to support the shaft of a plain cross on the summit. In our judgment, no monument designed to commemorate the dead can be more touching and appropriate than this. It admits of the introduction of sculpture, it admits of inscriptions; and provided it be suitably placed, as, for example, in the quadrangle of a college or a cathedral close, it may unite all the conditions of a Christian and English monument. Indeed, the example of the Scott monument at Edinburgh, which is in fact one of these crosses, shows that it may be placed without impropriety even in the thoroughfares of a great city, which has in other respects nothing of the mediæval character. We confess that we regret that the monument erected at Sentari, by order of Her Majesty, to record the gallant endurance of the British army in the Crimean war, did not assume the shape of one of these eminently national structures, endeared to us by historical tradition and religious associations, in place of the obelisk of Cornish granite which has been placed there.

Some years ago the present Dean of St. Paul's, who was then a canon of Westminster, proposed the execution of a monument to Caxton, near the Almonry, Westminster—that being the spot where the first English printing-press had been worked. The proposal was well received and supported by a small number of accomplished persons, who felt the fitness and grace of such a memorial; but it did not excite much public interest, and, for want of funds, it fell to the ground. We now advert to it for the purpose of noticing the very appropriate character which Dr. Milman had wished to give to this monument. He suggested that an ever-flowing fountain, combined with a statue of the first English printer, would be no inapt symbol of the spring opened by the printing-press to the knowledge and improvement of mankind. No doubt the introduction of fountains, in itself a desirable and refreshing thing in large cities, might, with excellent effect, be combined with monuments: thus the French have erected a striking fountain-monument to Molière, and many other examples might be cited in Rome and elsewhere of fountains which have a monumental character. In their way, though they are for the most part unpretending and diminutive, many of the drinking-fountains lately introduced in London, and several other large towns, deserve to be noticed among our public monuments. They are in every way grateful. They offer a simple refreshment, which often diverts the hot and weary labourer from the gin-shop. They mark a kindly feeling towards the humbler classes by giving to every man "a cup of cold water;" and as specimens of art many of these little works are very pleasing additions to our street architecture. They serve to show how much more might be done with the introduction of a conduit of running water, when a more important monument is contemplated and more ample funds are forthcoming. No capital in Europe is so well provided with water as London in the mains underground, or so little beautified with the freshness of streams above ground. A fountain on an imposing scale is still wanting to the metropolis, and, as far as we know, there is not a town in the United Kingdom which can boast of a good one; yet fountains may well be ranked amongst the most pleasing and useful of public monuments.—*Edinburgh Review*.

FIRES IN LONDON.

(From the MECHANICS' MAGAZINE.)

THE Select Committee, appointed some three months since by the House of Commons, to enquire into "the existing state of Legislation, and of any existing arrangements for the protection of life and property against fires in the Metropolis," have completed their mission, and made their report. This has been published, and it may be well to investigate its averments. The alarming increase in the number of destructive fires in London during the last few years, and the apparently quite inadequate means possessed for their suppression, had, indeed, rendered legislative enquiry necessary. The Committee set out in their report with a statistical comparison of the number of fires in London in past years as compared with the number which occurred in 1861. For example, they state that in the year 1833, 458 fires occurred in the Metropolitan districts, whereas in the year 1861, the number was 1,183. So startling an augmentation forms of itself a severe consideration of the existing arrangements for the prevention of fires, that it needs no argument to sustain it. The area of the Metropolitan police districts includes, according to Sir Richard Mayne, 217 parishes, with a population of about 3,000,000, residing in 462,000 houses. The rateable income for taxation in the mammoth town and its immediate suburbs is about £13,500,000. The extent of space included in the calculation is bounded by a radial line of 16½ miles, with Charing Cross for its centre, and this gives, therefore, an area of 700 square miles. The City of London, however, is not included, but within its boundaries are 97 parishes, with a population of about 115,000, inhabiting some 13,500 houses, and the rental for rating is £1,337,000. Thus it appears that the whole of the Metropolitan police districts, and the City of London together, may be considered as containing rather over 3,000,000 of inhabitants, in about 745,000 houses, whilst the rental for rating may be taken in round numbers to be £14,800,000.

These facts and figures convey a clear idea of the range and importance of the trust confided to those who are charged with the guardianship against the disastrous consequences of accidental or incendiary fires. The Committee state that "the only existing Act of Parliament for the prevention of loss by fire, affecting parishes within the bills of mortality, is that of the 14 Geo. 3, c. 78, and called 'an Act for the further and better regulation of buildings and party walls, and for the more effectually preventing

mischiefs by fire within the Cities of London and Westminster, and other liberties thereof, and other the Parishes of St. Marylebone, Paddington, and St. Luke's, at Chelsea, in the county of Middlesex." The clauses in this Act, which relate especially to protection against fire, are those numbered from 74 to 86, both inclusive, and they are still in form. The other parts of this Act have been repealed. By the 76th clause, every parish is obliged to keep one large engine, and one small one, termed a hand-engine, besides a leathered pipe, and a certain number of ladders. A provision, moreover, exists in the 3 and 4 Will. IV., c. 90, 344, and known as the "Lighting and Watching Act." This Act extends to England and Wales, and it empowers inspectors appointed under it to provide and keep up two fire-engines. Certain parishes, without the bills of mortality, have availed themselves of that provision. The meagreness of all these arrangements is sufficiently obvious, and, meagre as they are, they have not been attended to.

The Select Committee state—and it will conduce to a more exact understanding of the whole question if we reproduce the substance of their statement—that for many years previous to 1832, the principal fire insurance offices kept fire-brigades at their individual expense. To these brigades were attached a considerable number of men usually occupied as watermen on the Thames. These latter received payment only on the occurrence of fires, and they wore the badge and livery of the various companies by which they were subsidized. These fire-brigades were considered as giving notoriety to the different insurance companies, and a rivalry was maintained among them, productive of good sometimes, and considerable evil at others.

The expenses and inconvenience arising from this unsatisfactory state of affairs induced Mr. R. Bell Forde, a director of the Sun Fire Office, to make, in 1832, an effort to reform the system. This consisted principally in a proposition for the amalgamation of the guerilla bands—as they might be termed—into one body. Mr. Forde's plan was adopted, and hence sprang into existence the London Fire-Brigade. The leading Metropolitan insurance offices contributed their quota to the support of the brigadiers on conditions laid down by representative committeemen from the various companies. Without tracing the subsequent changes made in the mode of governing the London Fire-Brigade, it may be stated that at its organisation, in 1832, it consisted of 80 men, while the number of fire-stations was 19. The cost of the brigade and its appliances in that year was £8,000. This expense has been gradually increasing, as has the nominal strength of the body and the number of engines employed.

At present the London Fire-Brigade consists of 127 men, and the stations are 20 in number.

The destruction by fire of the Houses of Parliament, in 1834, very naturally drew the attention of the Government to the means for suppressing fires generally in London. It is only justice to the fire insurance companies then in existence to say that they admitted the inadequacy of their arrangements for preventing and overcoming fires. A suggestion was also made, at the same time, for placing the parochial engines under the control of the Metropolitan police. This latter notion might, if realised, have been attended with some good probably, but the Government of the day did not adopt it, and so the fire-brigade has remained with all its anomalies and shortcomings—as regards the system, we mean, upon which it was based—until now.

It is needless to recapitulate the arguments for the reconstruction of the London Fire-Brigade which were energetically urged in the pages of this Magazine immediately after the great fire of last year, because that disastrous event, and the innumerable catastrophes of a similar though less ruinous kind, which have happened since, have demonstrated the absolute necessity for such change. But it is certainly refreshing and encouraging to find from the report now under notice that "the insurance companies addressed on the 21st of February last," the very day after the first meeting of the Select Committee, "a letter to the Secretary of State for the Home Department, stating their wish and intention to give up the brigade at as early a date as may be consistent with the formation of new and efficient arrangements for the protection of the Metropolis against fire." They state in that communication that, "so long as the expense was moderate they did not object to incur it; but now it had assumed a magnitude which they cannot continue to bear, and that they consider that the public of London have no claim whatever on their respective offices for protection against fire." It certainly was rather late in the day for the companies to admit their deficiencies, and show their readiness to abdicate their functions as the suppressors of London fires; but it is satisfactory to find them, at last, so completely in accord with the public sentiment. The fact of their being so renders legislation on the subject more facile, because now there are no dissentients to the needed reformation of the fire-brigade. The fact was, that the system, having outlived its time, its abolition will be hailed, by the vast and populous districts of the Metropolis, with real satisfaction.

There is no reason to doubt the efficiency of the staff comprising the Insurance Companies' Fire-Brigade, so far as personal courage or determination is concerned. On the contrary, they appeared to have been well selected and trained, and, in many instances, their services have been of immense value. There is no reason, therefore, why officers and men should not be absorbed in the more extensive organisation which it may be trusted, will presently be called into being to supplant it. Indeed, this Committee recommend some such step as this, and there can scarcely be any objection to offer to it.

There is much valuable evidence adduced in the report, with regard to fires generally, and the means adopted in the large cities and towns of the

kingdom for preventing and overcoming them. As respects large establishments in London, too, the committee have sought out, and now given to the public, a considerable amount of useful information. The dock companies have taken especial care to make themselves, to a great extent, independent of extraneous aid in the suppression of fires which may break out on their premises. The East and West India Docks are particularly well cared for, as touching this matter. So is the Royal Mint; and among private firms who have endeavoured to provide means, not only for the preservation of their own property, but of that of their neighbours, too, we may mention Messrs. Brown, Lenox, and Co., of the Isle of Dogs, and Mr. Hodges, of the great distillery at Lambeth.

Honourable mention is made in the report of the "Society for the Protection of Life from Fire," and undoubtedly that society has proved of inestimable value in many instances. It is just one of those institutions of which Englishmen may be legitimately proud, and of which we happily possess a considerable number. Supported purely by voluntary contributions, and having for its object the saving of human life, it is to the Metropolis what the National Lifeboat Institution is to the rock-bound coasts of England—a guardian and friend to those who are in imminent peril. No less than £7,000 per annum have been subscribed for the support of the Society for the Protection of Life from Fire for eighteen years, and this speaks eloquently of the benevolent disposition of our countrymen. Into the question of obtaining a more adequate and ready supply of water for the purpose of suppressing fires in the metropolis, it would be premature for us now to go. It is one which will have to be considered, nevertheless, in conjunction with that of the formation of the New Metropolitan Fire-Brigade, and at the proper time we shall advance an opinion as to the best mode of effecting it. There are several other points connected with the Report of the Fire Committee which will be treated on in another article. We most cordially concur in the general conclusions of the Committee, which conclusions, indeed, embody the propositions offered last year in our own pages. There are but three absolute and official recommendations offered to the House of Commons in the report, namely:—

"1. That a fire brigade be formed under the superintendence of the Commissioners of Police, on a scheme to be approved of by the Secretary of State for the Home Department, to form part of the general establishment of the Metropolitan Police, and that the acts requiring parishes to maintain engines be repealed."

"2. That an account of the expenditure of the New Police Fire-Brigade be annually laid before Parliament, together with the general police accounts, in such a manner that the special cost of the brigade may be ascertained."

"3. That the area of the new fire brigade arrangements be confined within the limits of the Metropolitan Board of Works, with the option to other parishes to be included, if within the area of the Metropolitan Police."

The policy of confining the action of the brigade to the limits named is not transparent; but it is only "recommended" that those limits be observed, and probably the House in its wisdom will extend them.

THE DIGNITY OF LABOUR.

MUCH has recently been said about the glories of the International Exhibition, but up to the present moment speakers and writers have been almost altogether oblivious of the claims of labour and the labourer. Commissioners, jurors, guarantors, exhibitors, and others, have had bestowed on them criticisms in abundance; but the *workman* has been forgotten. Even Tennyson, in his inaugural poem, had no word of praise or encouragement for him. What said Elihu Burritt, while in this country, in 1851, when the first International Exhibition gladdened the eyes of millions? Listen:—

"During the last months of 1850, thousands and tens of thousands of the well-skilled artisans of Prussia, Austria, and other German states, had laid down the peaceful implements of their handicraft and were training their fingers to the bloody trade and weapons of war. And was this the time?—was this the juncture of favouring opportunities for the Great Exhibition of the arts and industries of all nations? So its originators believed. Against the mind of the million they believed it steadfastly. To their faith the *now* had come for the complete realisation of the magnificent conception. Unaided by legislation, with no governmental power or authority to lean upon, they sent out their idea, dovelike, among the divided populations of the earth. It dropped into the hearts of peoples like a still small voice of Divine inspiration. It permeated the minds of the masses, and touched their sympathies to the finest issues. It worked upward into the highest ranks of human society, and downward into its lowest conditions; and pervaded and united all with the common sentiment, that the great day of UNIVERSAL LABOUR had come, when it was to be crowned with glory and honour, and the homage of potentates and peoples. Away upon the sea, to distant islands and continents, flew the summons of that thought; and the sons of toil, of every handicraft, and clime, and colour, opened their hearts to its message; and it thrilled their fingers with such ingenious activities as never before wrought in the mechanical creations of human skill. The great day of LABOUR had come. The queen of all the earthly conditions of humanity was to be brought to her throne, with kings and queens as her train-bearers, with shoutings of grace and glory to her sceptre from the many-tongued myriads of her subjects. Labour, patient, peaceful Labour, that from the

closed gates of Paradise went forth weeping into the wilderness of life, and tracked it with the red pathway of her bleeding feet; Labour, that had made bricks without straw in Egypt, and lain pale and hungry, and begged for crumbs on the door-stones of palaces, which her blistered hands had filled with dainties which the eye and appetite of ungrateful luxury could not enjoy; Labour, that had walked and worked her way through the barbarisms and feudalisms of the past, with the fetter-prints of bondage still fresh and crimson around her limbs; meek, lowly-minded Labour had come to her immortal *now*, to the day of her august coronation. And her lowly men of might, who bore in their sunburnt foreheads and in their horny hands the dusky signets of their loyalty, felt that her day was come. And with a new sentiment of dignity, the pearl-divers of distant seas, with strong and downward beat, descended to deeper fathoms of the ocean's depths, and searched its shining bed for 'gems of purer light serene' than ever shed their lustre on regal courts; the diamond-diggers of different zones hunted with new ambition for the costliest stones of the earth's treasury to stud the coronation jewellery of Labour; and the trappers of frozen regions, and the fishermen of the Poles, the men of the mines of deeper fathom than the sea; the diggers and workers of all the precious and useful metals and minerals which the earth contains; the workers of the spindle, shuttle, and needle; the artisans of hostile countries forgot their nationality in the sentiment of the dignity of their common condition, and all wrought, with the highest enthusiasm of their genius, to bring the masterpieces of human art to the crowning of Labour. And the kings and queens of the earth felt that the first jewels of their crowns owed their lustre to Labour, and they brought them forth to shine among the gems of her coronation, in the great Temple of Peace and Concord. And the first queen of the world acted as bridesmaid at the royal robing of Labour, and in sight of the congregated nations she set the tiara of the world's homage on her brow, and gave her a glorious bride, to the dignity of universal humanity, as the first-born and fairest of the earthly offspring of Omnipotence. And who among the thousands that filled, or the exulting millions that surrounded, the Crystal Temple on that august occasion, could doubt that its illustrious *now* had come, with its world-full of the finger-prints and finger-guidings of Divine Providence; with its favouring sympathies beating fellowship in the bosoms of nations: with attractions and unprecedented opportunities for the realisation of this magnificent scheme of peace and human brotherhood?"

MR. WILLIAMS ON ECCLESIASTICAL ARCHITECTURE IN GEORGIA AND ARMENIA.

ON Tuesday evening the Rev. GEORGE WILLIAMS, B.D., of Cambridge, delivered a lecture at the Architectural Museum, South Kensington, "On Ecclesiastical Architecture in Georgia and Armenia." In the unavoidable absence of Mr. A. J. Beresford-Hope, the President of the institution, the chair was occupied by Mr. JOSEPH CLARKE, hon. sec. The lecture was accompanied by a number of drawings and plans. The lecturer said:—

In proceeding to perform the task which I have undertaken, of bringing under your notice some of the ancient Ecclesiastical Monuments of one of the most venerable and interesting churches in Christendom, I think I shall best engage your interest in the subject, if I ask you to follow me on a short Ecclesiastical tour, which I made on the banks of the River Kur, the ancient Cyrus, in August 1860, visiting the churches and convents in the same order in which I saw them, but without entering into any incidents of travel, which, however interesting, have nothing to do with the proper subject of this paper.

We must then commence our survey at the picturesque village of Borjom, the summer residence of the present Viceroy of the Transcaucasian provinces of Russia, as it was of his predecessor, Prince Woronoff. And I must not allude to the Viceroy without paying a tribute of gratitude to Prince Baryatinsky, through whose courtesy and kindness I was enabled to undertake these expeditions on which I collected the notes which I am to bring before you this evening. I had not been five minutes in conversation with him at my first interview, when he referred to the numerous monuments of ancient Christian architecture, which are found in the forests about Borjom, and when he found how deeply I was interested in the subject, he first conducted me himself to the two churches which I shall first describe, and then engaged for me the kind services of Prince Toumanoff, the Governor of the province of Abkhazie, to facilitate my expedition to the Upper Kur, where he told me some of the most interesting and remarkable ruins were to be found.

I was so fortunate as to have for my companion my friend Mr. Witts, whose very accurate drawings of several of these churches will serve to convey to you a better idea of them than any mere description could do. They are executed by himself, from sketches made on the spot, while I was busy with my measuring tape, making as careful a survey as time permitted of the various buildings, which I proceed to describe. I have thought it right to mention my authorities, because the measures, and elevations, and plans, which I give, differ very materially from those which are found in the works of Brosset and Dubois de Mont Pereun; which last named worked is utterly untrustworthy, so far as my own observations qualify me to judge, in the architectural sense. M. Brosset's book has been of great service to me for the translations of Georgian inscriptions, furnished to him by a native of the country who travelled with him.

With these preliminary remarks, I proceed to a description of the Conventua, Church of TIMOTHESMANE, which I have not found elsewhere described. I visited it twice; first, on the evening of my arrival at Borjom, in company with the Viceroy, and again on my return from my expedition to Abkhazie, for the purpose of taking the measures which served as the elements of the Plan and Elevation which you see before you. This convent was situated in a romantic valley, at the distance of about fifteen miles from Borjom, near the mountain-stream of the same name, which debouches into the Kur at the village, after a

circuitous course through rocky valleys at the foot of lofty hills, covered with rich and variegated foliage.

Of the conventual buildings nothing remains except the massive ruins of the great entrance gateway, and fragments of walls, and foundations all overgrown with rank vegetation. All these fragments indicate that the convent was built of red brick, as is also the church, with the exception of the south porch and the roofs, which are all constructed of slabs of stone in excellent masonry, with ridges at the joints, as in leaden roofs, and a bold overhanging cornice. The exterior ground-plan of the church, which is in excellent preservation (considering that it has been abandoned now for many years), is an oblong parallelogram of about 65 ft. by 48, with a porch in front nearly square (18 ft. 8 in. from N. to S., and 18 ft. 1 in. from E. to W., interior measure), and another at the south which measures internally 18 ft. 8 in. from W. to E., and 14 ft. from N. to S. But though the ground-plan is a parallelogram, the roofing indicates that it is a cruciform church, with a polygonal lantern of twelve sides, rising from the intersection of the transepts.

I proceed to a survey of the interior: It consists of *nave*, with *side aisles*, a *transept*, extending the whole width of the building, and a well-developed sanctuary, flanked with *prothesis* and *diaconicon*. The interior measures are as follows: from W. to E., the nave, 22 ft. 9 in.; the transept, 17 ft. 10½ in.; the sanctuary, 16 ft. 4 in. The nave is 18 ft. 3 in. wide; the aisles 6 ft. 5 in., exclusive of the piers, which are 4 ft. 3 in. each: giving to the church a total length of 56 ft., and a width of nearly 40; but small as these dimensions are, the church conveys an impression of great dignity and solemnity. The nave is of only one bay, and is separated from the aisles by pointed arches, the flat surfaces of which are decorated with frescoes, representing gigantic figures of kings or princes apparently, as they have a martial appearance, and are vested in a costume very similar to the present national dress of Georgia, with scimitar-shaped swords, still seen in this country and among the Caucasian tribes. In the centre of the arch is a cross, between the heads of the figures. The aisles are covered with Barito roofs of massive stone, leaving a low clerestory below the eaves of the nave-roof, which is not pierced with lights. The transept is lighted with a double-light window on the south, and a triplet on the north, quite of a Norman character. The walls of the transept were formerly covered with frescoes, but they are not so well preserved as those of the nave. The lantern rests on pendentives, supported by two massive octagonal columns on the west, and on responds in the extremities of the *parabemata* [wall of the sanctuary] on the east, and is exquisitely light and elegant. Unfortunately I had no means of ascertaining the height, so that in this particular my elevation is conjectural. The sanctuary has an apsidal termination within, as have also the *prothesis* and *diaconicon*; the former of which communicates both with the sanctuary and the north transept, while the latter opens only into the south transept. The sanctuary is lighted with three round-headed windows, very much splayed, the flanking chapels with one light each, of a similar character. A stone bench runs round the apse, left in the thickness of the wall, the *synthronus* of the eastern as of the western churches; and at some height above this the wall is decorated with a horizontal band in fresco, of arabesque character. The arches are all devoid of mouldings, and the church must always have been more dependent on its proportions and artistic decoration than on its architectural features, for the grand and solemn effect which even in its deep decay it still retains. It appears to belong all to our date, except the west and south porches; but as no inscription is to be found in any part of the building, and there is no Monasticism of Georgia that I am acquainted with within the reach of the archaeologist, I fear I can throw no light upon the date of this very interesting church, which I must mention is called *Cimothisman* by a great Georgian authority, cited by Brosset, whose name I will not attempt to pronounce (M. Dimitri Méghwineth-Khontzsis-Chwili), and whose brief description of the Monastery contains nothing of importance.

DABA.

On our return to Borjom, about half-way from Timothesmane, Prince Baryatinski conducted me to another church, at a short distance from the road, hung on the steep side of the mountain, where it descends into a valley watered by the Borjom river, which meanders through it. This small gem of a church is situated under an overhanging rock, fringed with foliage, out of which it might almost seem to be chiseled. So exquisitely fine is the masonry, that the joints of stone are scarcely visible under the profusion of arabesque ornament, with which the whole of the west front is covered; as fresh as if it had been executed yesterday.

This church was a complete contrast in plan and proportions to that which I have just described; but I afterwards found reason to believe that this was a type of a village church, as that was of a large conventual or cathedral church, and that it was a happy accident which thus introduced me to two typical churches in my first essay in Georgian ecclesiology. The Church of Daba consists of a rectangular chamber, terminating in an apse, the chord of which is the whole width of the chamber. The rectangular part is divided into two bays by pilasters in the side walls, and is lighted by small round-headed windows in each bay, with another in the apse, all very much splayed. All these windows are richly decorated externally with exquisite arabasques running on broad bands between the mouldings, deeply chiseled in the stone, the east window being richest of all. The west front, however, is the most richly ornamented part of this beautiful little church. It consists of a flat-headed doorway under a lofty round arch, with a plain tympanum, the door itself being set in a square-headed frame of two orders, the flat surfaces of which are adorned with rich arabasques, similar to those round the east window. An inscription in Georgian characters, in excellent preservation, is carved on the lintel of the door. Over the circular arch is a small window similar to the others, and like them, surrounded with bands of arabesque ornamentation; and above this, in the ngle of the gable, is carved a small cross. The heavy, overhanging cornice, and the ribbed stone roof, complete this exquisite composition, which measures only 37 ft. 4 in. by 23 ft. 11 in. externally, the walls being 3 ft. 10½ in. thick, and the eastern wall giving no indication externally of the apse which exists within.

Happily, this building is dated in the inscription on the lintel, the letters of which are deeply cut and filled in with vermilion. I need not trouble you with a literal translation: the facts which may be deduced from it are as follow:—That the church was dedicated to the Incarnation, and was built by the Chancellor of the Exchequer ("Chief of the Treasurers," is the literal translation) of

George VI., surnamed the Illustrious, the only son of Demetrius II.: in the year of grace 1333. It probably owes its perfect preservation, after an interval of more than 500 years, to the protection afforded it by the shadow of the great rock, not less than to the excellent materials of which it is constructed.

(To be concluded in our next.)

GENERAL ITEMS.

THE CRYSTAL PALACE IN A NIGHT STORM.—Last Wednesday se'nnight, says the *South Eastern Gazette*, we had an opportunity of being inside the Crystal Palace during the violent thunderstorm that visited the neighbourhood of Sydenham. The novelty of the sights that presented themselves was striking and marvellous. In a moment, from intense darkness the whole building was lit up—every object standing out as bright as in day in all the distinctness of the stereoscope, to which indeed it might be compared, with the additional association of grandeur in its fullest extent. At another time the western end of the centre transept assumed the character of a brilliant luminous mass, with a vividness that lightning only possesses—brighter far than the sun. Then, again, the roofs were illuminated, all their beautiful proportions exhibited, and their outlines distinct and dazzling, as though studded with millions of diamonds. Turning to the southern side we looked out upon the expanse that lay before us; here the scene was magic in its character. From intense darkness, flitted, at rapid intervals, every object, statue, fountain, tree, shrub, terrace, and the distant country to Sevenoaks, in brilliancy that can scarcely be described by language. We never before witnessed anything so peculiarly beautiful and grand.

GAS.—The village of Welwyn, near Hertford, on the Great Northern line of railway, has recently been lighted with gas by Messrs. Adkins & Son, the well-known engineers of Chesham and Fleet Street, who have erected the works for G. E. Dering, Esq., of Lockleys Hall, a gentleman residing in the neighbourhood. The works, a neat brick block, are situated near the entrance of the town from the London road. The main pipes are well distributed, reaching as far as Lockleys, and the Railway Company are anxious to have it extended to the station. The inhabitants have fallen in with the undertaking, and the liberality of the proprietor of the works is appreciated by the most influential of them consuming the gas.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—At a private meeting of the members of this body, held at the rooms, 9 Conduit Street, Regent Street, on Monday evening, "to reconsider the resolutions respecting professional practice and charges of architects," Mr. Owen Jones, V.P., in the chair, it was moved by Professor Donaldson, seconded by Mr. Street, and resolved—"That the paper of professional practice and charges of architects last published by the Council, and forwarded to the members, be now confirmed and adopted." The next ordinary general meeting of the session will be held on Monday next, when a paper will be read "On the Architecture of India," by Mr. William Simpson.

BEAUTY.—As long as Athens and Sparta maintained their independence and reverence for the laws was the basis of their constitution, taste was immature, art was in its infancy, and Beauty was far from swaying the disposition. It is true, poetry had essayed an elevated flight, but only in the soarings of genius which we know is closely connected with a state of rudeness, and is a light which frequently shines from the midst of darkness; which thus testifies rather against them for the taste of its age. As the golden age of art advanced under Pericles and Alexander, and the influence of taste extended more widely, we find no more Grecian energy and freedom. Eloquence adulterated truth; wisdom was an offence in the mouth of a Socrates, and virtue in the life of a Phocion. The Romans, we know were obliged to exhaust their strength in civil wars, and enervated by eastern luxury, to bow beneath the yoke of a future dynasty, before we see the triumph of Grecian art over the rigidity of their character. And the dawn of civilisation did not break over Arabia, until the energy of its warlike spirit had become relaxed beneath the sceptre of the Abassides. The fine arts did not appear in modern Italy, till the powerful alliance of the Lombards was broken, till Florence had submitted to the Medici, and the spirit of independence in all those vigorous states had given place to inglorious submission. It is wellnigh superfluous to cite the examples of modern nations, whose refinement increased in proportion to the decrease of their self-dependence. Whenever we turn our eyes to the past, we discover that taste and freedom desert each other, and that Beauty founds her dominion only upon the ruins of heroic virtue.—*Schiller*. [Beautiful as is this passage from the illustrious German poet, and replete as it is with historic illustrations, we do not for a moment believe with the writer that, abstractedly, "taste and freedom desert each other."—*Ed.*]

COPYRIGHT IN ORNAMENTAL DESIGNS.—BOARD OF TRADE, WHITEHALL, MAY 8.—The Right Honourable the Lords of the Committee of Privy Council for Trade give notice, that the period of regulation of copyright of ornamental designs in Class 1 (articles composed wholly or chiefly of metal) has been extended by them, under the powers conferred upon their lordships by the Act 13 and 14 Vic., c. 104, from three to five years, and that the fee of £1 will be charged for an original registration for five years. For every additional year for which registration of any ornamental design or class of ornamental designs in metal may hereafter be extended, the fee of 10s. only will be charged, instead of 30s. as heretofore.

Correspondence.

THE LECTURE ON PAGAN ARCHITECTURE.

Sir,—From the nature of the title, and the wanted facetiousness of the lecturer, I expected something very novel and startling indeed, at Conduit Street, on Tuesday night; imagining that Paganism, freshly watered at Parnassus, and jockeyed by a mediæval Puck, would have been full of reckless, racy curvings, and restive whims; so that thoughts as bright as diamond sparks would have been scattered as a laughing cloud among the shaking bodies of astonished hearers; but where high-seasoned and strongly-coloured burlesque was looked for, there came only the mildness of milky melodrama.

A visit to the Acropolis convinced Mr. Burges, as it had done all before, of the high pretensions of its monuments—they awed him into respect, wrung from him the accents of admiration, and the very dust of disintegration became, in his eyes, as "oxidized gold."

But the architecture of Greece, reasons Mr. Burges, is not suited to the climate of England; and then taking up the grand postulate of his discourse, he explains that St. Paul's is not at all like Greek architecture, and is therefore unsuited to our wants and unworthy of imitation! Such, at least, was the impression I carried off; and but for this attack upon our classic renaissance, it would have been simply necessary to substitute "Greek" for "Pagan," to give a truthful index to the paper, and to free it from the evidence of an ill-sustained desire to sneer.

COSMOPOLITE.

TENDERS.

CHURCH AT WISPMINGTON.

For pulling-down and rebuilding church at Wispmington, near Horncastle, Lincolnshire; Messrs. J. B. and William Atkinson, York, architects.
Young, Lincoln..... £1,095 0 0 | Pattinson, Huxington..... £900 0 0
Ward, Lincoln..... 1,073 0 0 | Wallis, Wragby..... 925 0 0

GREYFRIARS CHURCH, READING.

Restoration of Greyfriars Church, Reading; Mr. Soutan Hoordman, architect. For carpenters and smiths' work to roof:—
Mr. H. R. Lawrence..... £1,180 0 0 | Mr. Woodroffe..... £936 0 0
Mr. Perry..... 1,088 0 0 | Mr. Strong (exclusive of smiths' work)..... 900 0 0
Mr. H. Cooper..... 1,094 10 0 | Mr. Sheppard (accepted)..... 899 0 0
Mr. Sawyer..... 1,090 0 0
Mr. Matthews..... 999 0 0

The tender of Messrs. Wheeler, amounting to £1,800 for masons' work, was accepted.

MODEL COTTAGES, HEREFORDSHIRE.

For a pair of semi-detached model cottages, at Lynton Court, Herefordshire, for R. M. Lingwood, Esq.; Messrs. Elmslie, Francey, and Haddoo, architects, Hereford, Malvern, and London.
Pearson and Son, Ross..... £330 0 0 | Watkins, (accepted), Hereford... £270 0 0

VILLAS AT HAMMERSMITH FOR J. SAUNDERS, ESQ.

Mr. William Paice, architect, Temple Chambers, E. C. Quantities supplied.
Hill..... £292 0 0 | Bottom and Co..... £769 0 0
Booth..... 888 18 4 | Fish..... 744 0 0
Clark..... 799 0 0 | Foster..... 720 0 0
Sharphington and Cole..... 777 0 0 | Styles (accepted)..... 722 0 0

KNIGHTSBRIDGE.

New Buildings, 3 South Place, Knightsbridge, for Sir A. C. Stirling, C.R. Mr. Henry Clutton, architect, 9 New Burlington Street, W. Quantities by Mr. Crocker.
Macey..... £4,316 0 0 | J. Anson..... £4,400 0 0
G. Myers and Sons..... 4,412 0 0 | G. Mansfield and Son..... 4,750 0 0

COMPETITIONS OPEN.

CATHEDRAL.

CORK.—Architects are invited to furnish designs for the erection of the cathedral of St. Finbar, Cork, at a cost not exceeding £15,000. A premium of £100 will be given for the best and most approved plan, and £50 for the second. Plans and designs to be sent to the hon. secretaries, Ven. the Archdeacon of Cork, Rev. J. N. Woodroffe, or T. M. Osborne, Esq., Cork, not later than the 1st of August next. Further information and a plan of the site may be obtained on application to W. C. Bennett, Esq., notary public and Chapter clerk, 15 South Mall, Cork.

CHURCH.

LEAMINGTON.—Plans and estimates, in sections, are required for the completion of the parish church of Leamington. The nave, the chancel, and the north transept being already built, it is intended to proceed to erect the remaining portions of the work in sections. Architects are invited to send in plans and estimates, in sections, for erecting the south transept, the vestry, the lantern tower, and the bell tower; which it is intended to build in strict harmony with the architectural style of those portions of the church now erected. Increased accommodation in the church is most desirable. A premium of £20 will be given for the best set of plans and estimates in the opinion of the Committee, which must be sent, sealed and under motto, to Mr. G. Rogers, Newbold Street, Leamington, on or before the 21st June, of whom all further particulars may be obtained.

SCHOOL.

RAMNOR.—Plans and specifications are required on or before the 1st June, for the Knighton National School, Ramnorshire, comprising Boys', Girls', and Infants' School and Class Rooms, together with residences for Master and Mistress. For information as to site and other particulars, apply to the Rev. J. R. Brown, incumbent of Knighton.

LIBRARY AND READING ROOMS.

FIRMINGHAM.—The Free Libraries' Committee of the Council of the Borough require plans, sections, specifications, and estimates for the erection of a free reference library and reading-rooms, lending-library and news-rooms, and gallery of art, upon the piece of vacant land adjoining the Midland Institute Building, with an elevation uniform with the said building. Intending competitors are requested to send in their plans, specifications and estimates, under cover, to Thomas Standbridge, Town Clerk, Town Clerk's Office, Temple Street, endorsed "Plans for Free Reference Library Buildings," on or before the 1st June. Particulars of the accommodation required, and of the conditions of competition, together with a lithographed plan of the site, may be obtained on application.

MEMORIAL.

GLoucester.—The committee appointed to carry out the Hooper Memorial, at Gloucester, invite sculptors to submit models of designs for the figure of Bishop Hooper, which is intended to be placed under the canopy of the monument just erected in the churchyard of St. Mary de Lode, Gloucester. The models or statuettes to be carved in stone, and to be one quarter the real height (7 feet). The author of the best design, approved by the committee, will be appointed to execute the full-sized figure, and the sum of ten guineas will be awarded for the second-best design.

ALMSHOUSES.

SALTERS' COMPANY.—A plan is wanted by the Salters' Company for almshouses to accommodate twelve almswomen and six almsmen, on a plot of ground, about twenty miles in the country, comprising two acres, it being proposed to expend on the buildings and the necessary drainage, a sum not exceeding £35,000, a premium of £100 is offered for the plan which shall be considered the most eligible for the purpose. The successful party will be expected to furnish a proper specification of the requisite works, and the premium will be paid immediately it is ascertained to the satisfaction of the Court of Assistants that the proposed buildings can be erected for the sum mentioned. A plan of the ground and

statement as to accommodation wanted can be seen at the office of the Clerk of the Company, at Salter's Hall, St. Swithin's Lane; at which office the plans must be delivered on or before Tuesday, the 3rd day of June, 1862, before 12 o'clock at noon.

COMPETITION AWARDED.

BLUE COAT SCHOOLS, STOCKTON-ON-TEES.

The premium in this competition has been awarded to the design of Messrs. Pritchett and Son, of Darlington, which was selected out of twenty designs submitted, and is to be carried out by them at a cost of about £2,000.

CONTRACTS OPEN.

BARRACKS.

CHATHAM.—For improvements to soldiers' casemated barracks. St. Mary's. Tenders to be left at the Royal Engineer office, Chatham, where bills of quantities may be obtained up to Friday the 30th inst.

ALDERSHOT.—For painting externally the cavalry barracks, Aldershot, in the county of Hants. Copies of the specification, conditions of contract, and forms of tender to be had at the Royal Engineer office, Aldershot, up to the 2nd of June proximo.

WOOLWICH.—For renewing the slating and lead gutters of the soldiers' barracks, right wing, Royal Artillery Barracks, Woolwich, by measurement. Parties desiring to tender for the execution of these works, to leave their names at the Royal Engineer office, Woolwich, on or before the 4th June.

COAST GUARD STATION.

HAYLING BRIDGE, HANTS.—For the erection of a coast guard station at Hayling Bridge, near Havant, Hants. Drawings and specification may be inspected at the Coast Guard Station, Hayling Bridge, or at the Admiralty Coast Guard office, Spring Gardens, London, to Saturday, 31st May; and tenders received up to the 2nd of June.

METROPOLITAN MAIN DRAINAGE.

SOUTHERN OUTFALL WORKS, CROSSNESS.—For the construction of engine-houses, a boiler-house, chimney, fifth-hoists, coal-sheds, dwelling-houses, wharf-wall, sewers, and other works in connection therewith, at Crossness, Erith, Kent. Plans, &c., may be obtained at the Metropolitan Board of Works office, Spring Gardens, until 3rd July. Tenders to be sent in on 4th July.

CHURCHES, ETC.

SITTINGBOURNE, KENT.—For the erection of a new church at Sittingbourne, Kent. Plans to be seen at the office of Mr. Wimbles, Walbrook, Mansion House, London, and tenders will be received by Mr. Smith, Rose Place, Sittingbourne, up to the 31st May.

SOMERSET.—For building a north aisle, and making additions to the east end of the parish church of Weston, near Bath. Drawings, &c., with Manners and Gill, Architects, 1 Fountain Buildings, Bath; to whom tenders endorsed "Tender for Works at Weston Church," on or before the 24th inst.

IRELAND.—For the erection of a new Catholic church, to be built at Kenmare. The parish priest will show the plans and specifications, and will receive tenders up to June 1.

WARWICKSHIRE.—For repairing and restoring the parish church of Long Compton, Warwickshire, near Chipping Norton. Sealed tenders, directed to the Rev. H. Lamphier, Long Compton Vicarage, Shipston-on-Stour, on or before the 24th May.

CROPREY, OXON.—For the renovation and enlargement of All Saints Church, in the hamlet of Great Bourton, Cropredy, near Banbury, Oxon. Plans to be seen at the office of Mr. William White, Architect, Wimpole Street, London to the 24th inst., and at 8 High Street, Banbury, to the 2nd of June. Tenders received to June 3rd, by the Rev. the Vicar of Cropredy.

CHAPELS, ETC.

USK, MONMOUTHSHIRE.—For the erection of a new chapel and vestries on the site of the present Congregational Chapel at Usk, Monmouthshire. Particulars may be obtained of the architects, Messrs. W. G. Hatherson and Pite, 38 Bloomsbury Square, London; Park Square, Newport, Monmouth; and Belvedere, Tredegarville, Cardiff.

MANCHESTER.—For the erection of a chapel and school-room, in Booth Street East, Chorlton-upon-Medlock. Sealed tenders to the Rev. T. E. Evans, 108 Brunswick Street, Upper Brook Street, not later than the 24th inst. Plans, &c., with Mr. Robert Jones, 6 Moreton Street, Strangeways.

PLYMOUTH.—For a new Congregational chapel and schools at Plymouth. Plans to be seen at Norley Chapel School-rooms, Plymouth. Tenders received up to 2nd June.

SCHOOLS.

DEPTFORD.—For making alterations and additions to the school of John Addey's Charity, Deptford. Plans and specifications may be seen, and further particulars obtained on application to Joseph Liddiard, Esq., Architect, 5 Kent Terrace, Upper Road, Deptford. Tenders to be delivered at the offices of Mr. W. Sandom, Solicitor, Slades Place, Deptford, on or before 2nd June.

VILLAS.

ELTHAM, KENT.—For the erection of a pair of semi-detached villas. Tenders to be sent to Mr. T. Chester Haworth, Surveyor, Eltham, before 4 p.m. 23rd May.

HANTS.—For the erection of a villa residence at Botley, Hants. Plans, &c., at Mr. Hardy's, harness manufactory, on and after the 22nd inst. Tenders to the architect, Mr. John Colson, St. Swithin Street, Winchester, on or before the 5th June.

ROAD-MAKING, ETC.

FINCHLEY.—For making road and drains at Finchley. Plans to be seen at the office of Mr. V. Prance, Solicitor, 37 New Bridge Street, Blackfriars.

NOTTS.—For the execution of sewerage and road-making on the North Gate and Beacon Hill Estates, Newark-upon-Trent, Nottinghamshire. The following rough quantities are here stated, in order to indicate approximately the extent of the proposed works; but parties tendering will have to take out for themselves the quantities necessary for that purpose. On the North Gate Estate: 30 ft. roads, including 6-ft. footpath on both sides, 775 ft. run; 6-feet footpaths, extra, 410 feet run; stone kerbing to footpaths, 1,950 feet run; paved and pitched channelling outside of footpaths, 1,525 feet run; 15-inch pipe-sewer, 33 feet run; 12-inch ditto, 456 feet run; 9-inch ditto, 680 feet run; gully-cesspools, with 6-inch pipe overflows to sewers, 6 in number. On the Beacon Hill Estate: 45-feet road, including 7½-feet footpath on both sides, 516 feet run; 7½-feet footpaths extra, 520 feet run; stone kerbing to footpaths, 1,550 feet run; paved and pitched channelling outside of footpaths, 1,035 feet run; 15-inch pipe sewer, 114 feet run; 12-inch ditto, 530 feet run; 9-inch ditto, 440 feet run; gully-cesspools, with 6-inch pipe overflows to sewers, 4 in number. Plans, &c., at the offices of the Conservative Land Society's surveyor, Mr. James Wylson, 33 Norfolk Street, Strand, London, W.C.; also at the offices of Mr. Alfred Allen, Market Place, Newark-upon-Trent. Tenders on or before May 24, addressed to the surveyor, as above, and endorsed "Tender for Works at Newark."

DWELLING HOUSES.

STAFFORD.—For the erection of five houses, at Forebridge, for Mr. John F. Bridgwood, Wolverhampton Road, Stafford. Drawings, &c., with Mr. Henry Ward, architect, Bank Passage, Stafford.

PARSONAGE HOUSE.

ABERAYRON.—For building a parsonage house for Henlywynn, at Aberayron, Cardiganshire. The drawings and specifications to be seen at the Feathers Hotel, Aberayron, from Monday, 19th May until Saturday, 31st inclusive. Further information may be obtained from the Architect, Mr. R. J. Withers, 51 Doughty Street, London. Tenders to be delivered to the architect, on or before Monday, 2nd June.

CEMETERY WORKS.

BIRKENHEAD.—For the erection of three chapels, registrar's house, gate lodge, entrances and boundary walls, for the Cemetery at Flaybrick Hill, Birkenhead, &c. Plans and form of tender at the Commissioners' offices, 55 Hamilton Square, Birkenhead; and further particulars obtained of the architects, Messrs. Lucy and Litter, Traumaere, near Birkenhead. Tenders in sealed covers, endorsed, "Tenders for Cemetery Buildings," addressed to the Chairman of the Cemetery Committee, to be delivered at the Commissioners' offices on or before the 28th inst.

ASYLUM.

NORFOLK.—For the erection of male and female infectious wards at the Thorpe Asylum, Norfolk, and also for building four workmen's cottages on a piece of land adjoining it. Plans, &c., with R. M. Phipson, Architect, County Surveyor, Norwich, to the 24th inst.; and painters willing to tender for painting the whole of the outside wood and iron-work at the said Asylum, may see the specification for it at the same offices. Tenders to F. J. Blake, Esq., Treasurer and Clerk to the Committee of Visitors, King Street, Norwich, on or before the 24th inst., enclosed separately in sealed envelopes, and endorsed "Tender

for Infectious Wards," "Tender for Workmen's Cottages," and "Tender for Painting," as the case may be.

WORKHOUSE.

LIANTS.—For the works required to be done in making certain alterations in, and additions to the Alverstoke Workhouse. Plans, &c., at the Board-room of the workhouse on and after the 15th May, or at the office of Mr. Thomas Hellyer, Bouverie House, Ryde, Isle of Wight, Architect, of whom every information may be obtained, and bills of quantities may be had.

RAILWAY WORK.

INVERNESS AND PERTH JUNCTION RAILWAY.—For the construction of the two remaining sections of the line, viz.:—The Kingussie contract, extending from Kilmara Post-office to the south side of the river Spey, measuring about 13 miles or thereby, comprising about nineteen small bridges and culverts, with a timber viaduct across the Spey. The excavations and embankments consist of about 470,000 cubic yards. The Dalwhinnie contract extends from the south side of the Spey to the boundary of the county of Perth, measuring 15 miles or thereby, and consists of thirty-two small bridges and culverts, and about 430,000 cubic yards excavations and embankments. The rails, chairs, sleepers, spikes, fish-plates, and bolts will be supplied by the Railway Company. Drawings, &c., at the office of Joseph Mitchell, Esq., C.E., Inverness, from whom, or from the assistant-engineer on the line, duplicate schedules may be obtained at £2 2s. each. The line is staked out at distances of every 100 feet, according to the working sections. The deepest cuttings are also fitted to ascertain the nature of the materials in the excavations. An assistant-engineer will be at the County March, near Dalnacardoch, on the 20th May, at 10 o'clock a.m., to accompany the contractors over the Dalwhinnie contract; and at Spey-bridge, near Kingussie, on the 21st, to go over the Kingussie contract, and to point out the works and sites of the bridges. The draft contract proposed to be entered into will be seen with the assistant-engineer, or at Mr. Mitchell's office. Sealed tenders, addressed to the secretary, and marked "Tender for Inverness and Perth Junction Railway Works," "Dalwhinnie" or "Kingussie Contract," as the case may be, must be lodged at his office, on the 25th May, at 4 o'clock p.m.

RESERVOIR.

BLACKBURN.—For the construction of a new reservoir, to be called the Fish Moor Reservoir, adjoining the Guide Reservoir, near Blackburn, for the Directors of the Blackburn Waterworks. The work will consist principally of an embankment of 47 feet in height, containing about 340,000 cubic yards of material, with the masonry, stone beaching, and other work connected therewith. Plans, &c., at the office of the Water Company, Clayton Street, Blackburn; and at the office of Mr. Bateman, engineer, 9 St. James's Square, Manchester, and sealed tenders (a form of which may be had on application), endorsed "Tenders for Fish Moor Reservoir," must be sent in, addressed to "The Chairman of the Company," not later than the 5th June.

BRIDGES.

WORCESTER.—For the construction of a brick bridge and other work near Martley, Worcester-shire. Plans, &c., with Henry Rowe, County Surveyor, 17 Foregate Street, Worcester, where tenders, under seal, and properly endorsed, are to be delivered (free of cost) on or before the 24th inst.

POLICE STATIONS.

SIMDMOUTH.—For the erection of a police station, &c., at Sidmouth, Devonshire. Plans, &c., with Henry Ford, Clerk of the Peace, Castle of Exeter, and at the office of Messrs. Radford and Williams, Clerks to the Justices, Sidmouth. Sealed tenders, endorsed "Tender for Sidmouth Police Station," to be sent to Mr. Ford, on or before the 3rd June.

MALT OFFICE.

BURTON-ON-TRENT.—For the erection of a new malt office, with barley and malt stores, for the London and Colonial Company, at Burton-on-Trent. Plans, &c., to be seen at the office of Mr. Robert Grace, architect, Burton-on-Trent, to the 25rd inst.; tenders to be delivered on the 24th.

VESTRY HOUSE AND OFFICES.

FOOTSCRAY, KENT.—For the repairing and partly rebuilding the vestry house and offices at Footscray, in Kent. Tenders to be delivered on or before the 26th of May, addressed to the Rev. C. Buck, Footscray Rectory.

MODEL COTTAGES.

ERITH.—For the erection of two pairs of model cottages, and for certain alterations to the estate office, at Belvedere, Erith, Kent, for Sir Culling E. Eardley, Bart. Tenders to be delivered to Messrs. Hatherson and Pite, Bloomsbury Square, London, on the 24th inst.

WAREHOUSES.

WIGAN.—For the construction of new warehouses at Wigan, for the London and North-Western Railway Company. Particulars to be obtained of the Company's engineer, at Lancaster, on and after the 26th instant.

SEWERS.

NOTTINGHAM.—For the construction and carrying out of a low level river Leen culvert, and intercepting sewer from the Cok-hole in Finkhill Street, near the Water Works weir. Plans and specifications to be seen at the office of the Corporation Surveyor, Mr. Turbotton, and tenders received up to the 26th inst.

DRAINAGE WORKS AND STREET IMPROVEMENTS.

GRIMSBY, LINCOLNSHIRE.—For the erection of the following works:—Contract No. 1. Works of drainage. For the formation of 4,000 yards lineal of glazed pipe-drains, from 8 to 18 inches diameter, with outfall sluice, penstock, and other appliances.

Contract No. 2. Works of Street Improvement: comprising about 1,500 yards super of Yorkshire stone flagging, and 14,500 yards lineal of kerbing to footways; 17,950 yards lineal of flagging, and dwarf kerbing to channels, and 425 yards super of pitching to crossings. Plans, sections, and specifications, &c., may be seen at the Office of Mr. Joseph Maughan, Surveyor to the Local Board of Health, in Haven Street, Grimsby, until Saturday, 31st May instant, on which day Tenders for either or both of the Contracts must be delivered at the Office of the Clerk to the Local Board.

GRANITE.

BRENTFORD.—For 600 tons of hard Guernsey Granite for the Union Workhouse, Isleworth. Tenders to be sent on to Mr. Ruston, Clerk of the Guardians, on or before Tuesday, the 27th inst.

IRONMONGERY.

INDIA.—For the supply of Ironmongery for the Director General of Stores for India. Particulars may be obtained at the India Store Office, Cannon Row, Westminster, and tenders received up to the 2nd of June.

FLINTS.

MORTLAKE.—To send to the Surveyor of Highways, Mortlake, Surrey, the price per cubic yard at which Broken Flints can be delivered at the Ship Dock, Mortlake.

REPAIRS AND PAINTERS' WORK.

KENSINGTON.—For Sundry Repairs and Painters' Works to be done to the Vestry Hall, High Street, Kensington. Particulars of Mr. Broadbridge, Surveyor, at the Vestry Hall, and tenders received up to the 6th June.

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favour us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

Received.—T. R. S., G. T. M., W. W., G. C. H., J. W. T., S. T., G. W., T. M. C., E. A., H. L., E. W. C., W. H. B. (declined), J. H. (next week), Architect, B. D. & Co., J. P., R. H. G. (annot promise), Prof. K., A. M., J. L. C. Received.—The "Church Floral Calendar," "Passages from Modern English Poets," "Sketches from France and Italy." From Day & Co. These will be noticed in a future number of the BUILDING NEWS.

In our description of a new plan for building bridges, in our last number, we should have stated Mr. Sedley of 210 Regent Street, instead of 210 Oxford Street.

**** NOTICE.**—The BUILDING NEWS is now published at 166 Fleet Street, where all Communications and Advertisements should be addressed.

THE CHAPTER HOUSE, WESTMINSTER ABBEY.

DOWN at Westminster, east of the Abbey cloisters, from which it may be approached by a vestibule (passing a room known as the Chapel of St. Blaise on the left), is an octagonal apartment, some sixty feet in diameter; to the ordinary visitor a glance inside the doorway would serve to satisfy curiosity, and he would probably leave with the impression that it had been erected to serve the purpose of a store-room; the walls are partially hidden by great, clumsy, and now nearly empty presses; there is a wooden staircase leading to a gallery; a rough ceiling that does no more than enclose the upper part; and an ordinary wooden floor. True, in the centre of the room there is a Purbeck marble pillar, but the lower part has been long hidden, and the vaulting ribs which spring from the caps pass abruptly through the ceiling. In fact, there is nothing about the general appearance of the room to lead the casual observer to suspect that it is anything else besides a badly-planned storehouse.

But this room—it is the Chapter House of the Cathedral, though long known as a "Record Office"—was begun to be built as early as the year 1245, and was, when completed, a work of extreme beauty; the Chapter House at Salisbury, better preserved, was built in imitation of it, but, says Mr. Scott, it would have "yielded the palm to its prototype at Westminster."

It has been Mr. G. G. Scott's good fortune to have discovered the value of this architectural gem, and he has set himself earnestly to work to secure a wide appreciation of the importance of preserving, in a restored condition, a fine work of art. Few imbued with a love of art, perhaps none besides Mr. Scott, have had an opportunity of examining in detail the various portions of the structure. The plan, as we have before said, is octagonal: the diameter about sixty feet, and the height, to the crown of the vaulting, about fifty-four feet. It may be noticed, that the diameter agrees very nearly with that of the chapter houses at York, Salisbury, and Lincoln; Mr. Scott suggests, that probably the polygons were in each case inscribed in a circle of about sixty feet diameter, measured perhaps in the clear of the vaulting-shafts. The central pillar, about thirty-five feet high, is of Purbeck marble, and on plan it has a central shaft surrounded by eight smaller shafts, with three moulded bands; the capitals, of marble, are richly carved. The windows are almost entirely walled up, but the design has been preserved, owing to the fortunate accident that the tracery was repeated on one side of the octagon attached to the transept of the church; they had four lights, and were finely proportioned. The window over the doorway, however, being, in consequence of its position, shorter than the others, had five lights, and these, on examination, were found to have been walled up with stone, instead of brick, as was the case with the others; it turned out eventually that this stone filling-in consisted entirely of the moulded ribs of the lost vaulting, "carefully packed like wine-bottles in a bin, with the moulded sides inwards." Below the window, sufficient has been traced to show that the walls were occupied by arched stalls, with trefoiled heads, the five which occupy the eastern side being of superior richness and more deeply recessed. The capitals are of Purbeck marble, and the spandrels are diapered, usually of the pattern common in the church, but in one case exhibiting a conventual representation of roses. The walls within the arcade are covered with paintings, which are thought to represent our Lord exhibiting the mysteries of the Redemption to the heavenly host. Sir Charles Eastlake and Mr. Scott are both of opinion, that this work was executed about the middle of the fourteenth century. Paintings of later date of inferior character occur in other parts of the arcade. The doorway was originally double, with a central pillar and a circle in the head, now almost entirely destroyed; the jambs contain on the outer side four Purbeck marble shafts, with marble caps richly carved, the spaces between the shafts being foliated; the arch contains two orders of mouldings, both enriched; one on either side contains a series of figures in the intervals of the foliage. Unfortunately this fine doorway, which still bears distinct traces of colour and gold, was not long since rapidly crumbling to pieces; the surface being so disintegrated that it was not ventured to clean it by any rougher process than that of blowing away the dust by a pair of bellows with a flexible tube and nozzle. After this was done, under Mr. Scott's direction, a solution was injected from a finely perforated rose syringe, so as not to disturb the crumbling surface. The floor is the only part of this interesting structure which remains perfect, and it is nearly so, having been protected by the wooden floor. It is, perhaps, the finest specimen of old work of the kind now existing. Of the exterior unfortunately but little remains, but Mr. Scott thinks, that although at first its restoration seemed to be extremely difficult, subsequent examination proved that such was really not the case, and that the whole of the exterior could be restored, with the exception of the parapets and pinnacles, in accordance with the original design.

A meeting, convened by the Dean of Westminster, has been held in the Chapter House for the purpose of taking into consideration what steps are most desirable for its restoration, and we earnestly

hope that a monument of past ages, interesting, not only on account of its antiquity, but also, and chiefly, on account of its architectural beauties, as this is, will not be allowed to remain in its present state, so disgraceful to those whose care should be its preservation, a day longer than is required by the preparations for its proper restoration. If there was any doubt about the possibility of its being restored to its former design in all its integrity—if there was any suspicion that money was about to be expended in the erection of a new Chapter House of modern design, we should hesitate before assisting to such a course, and possibly might see reasons for objecting to it altogether; but Mr. Scott tells us distinctly that, not only the interior, but the exterior also, where the task looks far more discouraging, can be restored "in accordance with the original design." There is no question, therefore, as to the nature of the restoration we can have; there should be none as to the desirability of effecting the work, and there is no doubt as to the architect to whom it should be entrusted. The only difficulty that crops up is an uncertainty as to who is to pay for it?

Lord Ashburton, who occupied the chair at the late meeting, of course saw this difficulty, but it is not clear that he was also able to see a way out of it. If we lived under a despotic government, he said, we should probably see that the Chapter House would be restored by the edict of the reigning monarch; as it is, the only course that suggested itself to his lordship's mind, was "to lay the case before the public, in order that if, at any future period, they should find a government willing to propose a measure of restoration, it should have such a support from without, as should enable it to carry its measures through Parliament;" and meantime the building is to go on crumbling to pieces! A suggestion has been offered, that application should be made to the Ecclesiastical Commissioners; but the Chapter House is public property, and the Commissioners cannot deviate from the provisions of the Act under which the Commission is appointed. It seems to be understood generally, that it is of no use to ask Parliament for assistance at present, but that if a goodly proportion of the required amount be collected by public subscription, the House of Commons might consent to grant a vote in aid.

If the Chapter House is national property,—and it is so,—we contend that, supposing it to be desirable to restore it, the duty of providing funds for the purpose, and that at once, devolves upon the guardians of the public purse. There may be some who care sufficiently little for art as to object to the very small proportion which in such a way they would contribute, but there are also many who care a great deal for art, whose end is the bettering of our natures, and these it is not fair to ask alone to undertake a work in which, as it is for all, all should join.

The French have restored the Sainte Chapelle, and it is one of the places which all visitors to Paris go to see. Our Chapter House at Westminster, restored, would be a finer building than that at Paris, in which there are certain errors with regard to the colouring that we should do well to avoid; and yet it is to be allowed to crumble away for a few more years, until the last trace of its former beauty has disappeared; and that because, while spending hundreds of thousands of pounds in wanton waste, we are told that the nation cannot afford the twenty or thirty thousand pounds required to transmit to future ages a work which contains the very spirit of our earliest English architectural art.

The meeting on Saturday, which included Mr. Beresford Hope, Mr. Tite, Mr. Scott, Mr. Clarke and others, passed a resolution, "That this meeting regrets the ruinous condition of a building so interesting, both as an historical monument, and on account of its original architectural beauties, as the Chapter House at Westminster." We quite agree with Mr. Cochrane, who pointed out that the resolution stated that the ruinous condition of the building was to be regretted, whereas we ought to look upon such a state of things with a feeling of shame. He said truly, that it is a disgrace to the country, that our public monuments are allowed to fall into decay. That foreigners make severe criticisms upon our public buildings, and that such criticisms are well grounded. The meeting was further impressed, "with the desirableness of bringing the question of the restoration of the Chapter House under the consideration of Her Majesty's Government," and it was also determined that a committee should be formed to nominate a deputation to the Chancellor of the Exchequer, for the purpose of presenting a memorial to the Treasury, and for taking such other steps as would promote the objects of the meeting.

It is quite time that the parsimonious and false economy with which matters of art are dealt by the governing powers should cease, and we trust that for once the subject may be looked upon in an enlightened spirit; that money will be freely granted for the work of restoration, and at once; and that we shall not have to recur to the still crumbling ruins of the once beautiful Chapter House of Westminster Abbey.

THE ORDNANCE SURVEY.

WE lately took occasion to remark upon the importance to the country of its possessing an accurate reflex, on paper, of the peculiar geographical and topographical characteristics which distinguish it. It is unnecessary to urge this point further, because all who pay any attention whatever to the subject, cannot fail to admit the position we have assumed for the Ordnance Survey. The only point upon which difference of opinion may legitimately exist in reference to the subject, seems to us to be the scales to which the maps resulting from the Survey should be drawn. This point has, indeed, been discussed by Commissions and Committees, until the question, instead of being solved, has become more complex. The Select Committee of the House of Commons, appointed on the 3rd of March last, to enquire into the expediency of extending the Cadastral Survey to those portions of the United Kingdom which had previously been surveyed upon the scale of one inch to the mile only, have now reported in favour of that extension, and it remains for the House of Commons to give effect to, or reject the Committee's report.

In support of the view which the Committee of 1862 enunciate, they state that the advantages of a cadastral map in transactions affecting land, as between landlord and tenant, are self-evident. A cadastral Survey, while it provides facilities for the transfer of land from one proprietor to another, also describes the acreage of every inclosure. It provides for recording on the plans all improvements which the tenant may make, and for which he may claim remuneration on leaving his farm. It indicates the levels also which are necessary for the improvement of the land by drainage, and it can be used for marking the exact positions of the drains. The aggregate of farms depicted on the cadastral map makes up the whole county, and the advantages, therefore, are not only local, but national. The question of the improvement of the productive power of the land affects the whole community. And all experience tells us that, whether for the improvement of lands already under imperfect cultivation, or for the reclaiming of waste lands, or the reclaiming of land from the sea, the first demand is an accurate map with levels, on which all the work contemplated to be made can be distinctly and clearly laid out.

The advantages which the cadastral plan affords to those who are carrying on engineering works, such as fortifications, hydrographical surveys, geological surveys, railway surveys, and drainage, are not less important than those which it affords to the transfer and management of lands.

The Committee summoned, in support of their statements in regard to these last-named considerations, several eminent witnesses, dead as well as living. The Duke of Wellington has expressed himself strongly on the advantages which would accrue, in a military point of view, from the publication of large-sized plans of the country. He pronounced the scale of six inches to the mile, to be the smallest size which would give really useful information to military engineers. Surveys for military purposes are, in fact, frequently required, and more especially now that public attention has been turned to the subject of the defences of our dock-yards, and other public works. The National Defence Commission has lately ordered a considerable number of surveys for the use of that Commission. These have all been conducted on the scale of $\frac{1}{62500}$, and are so made, that if Parliament should decide to proceed with the general survey of England on the same scale, they will square with that general survey. They are based on the same triangulation, and carried out in the same careful way that the cadastral Survey would require.

As regards hydrographical surveys, the very strongest testimony has been given by many distinguished officers of the navy in favour of the large scale, or cadastral plan. These officers are unanimous in expressing first the great value of the Ordnance Maps to the coast survey. Secondly, that the maps on the 6-inch scale, from their ample and clear details, furnish the surveyor, almost at a glance, with a general knowledge of the configuration and features of the coast, the high and low water-line, &c. Thirdly, they supply such minute and accurate data, that the surveyor in his off-shore soundings is often enabled to make use of some mill, house, or other conspicuous object on the shore, and thus to fix his position; the map being his infallible guide, although the trigonometric points are covered by clouds, or obscured by mists. Many other reasons are adduced in the same quarter by the naval officers referred to, and they are supported unreservedly by Mr. Washington, the Government hydrographer. Sir Roderick I. Murchison bears testimony to the value of maps on a large scale in the Geological Survey. He asserts that Professor Ramsay and his assistants, having been engaged in a geological survey of Haddingtonshire, had found that the 6-inch maps with contours had afforded them great facilities for the mere exact completion of their work.

Touching coast cliffs, or rocky shores, which so often give the geologist a key to the real framework of the adjacent inland tracts, all the physical features are so minutely laid down that every curve or

break in the strata can be accurately noted on a 6-inch map. In the interior of such a country, provided with a cadastral map, it is plain that the geologist may insert on it in writing all descriptive lithological details pertaining to every stone, quarry, or natural feature. If he happen to be working in a track of coal or iron, he may in the same way delineate the precise outcrops of the respective beds or bands of these minerals, and insert also on the map much valuable local information. Sir Henry James states, that there are about 13,000 miles of railway in the United Kingdom, the surveys for which cost not less than £250,000, and had a National Survey existed prior to their formation, at least £200,000 of this would have been saved.

In this opinion Sir Henry is strongly fortified by the evidence of the late distinguished engineer, Mr. Locke, who spoke frequently of the great saving which would be effected by the possession of an accurate government map. This would, he said, enable an engineer to get a good idea of the country to be traversed at once, and without trusting to personal observation. Sir John McNeill has expressed similar opinions. The 6-inch scale, he said, "enabled you to lay out the lines on the maps for either railways, canals, or harbours, for the purpose of lodging in the different offices, and also in the offices of the clerks of the peace on the scale required by the standing orders." Sir John added, that he had actually laid out by the Ordnance Maps more than 2,000 miles of railway, and that experience led him to give a most decided preference to those on the 6-inch scale. He believes that the saving of expense to the parties who employed him on these occasions by using the Ordnance Maps was not less than £10,000.

In the matter of drainage, too, equally satisfactory testimony has been adduced before Commissioners or Committees, and there can be little doubt, we are sure, in the minds of our readers as to the advantage of cadastral maps over those on a small scale. We would scarcely advocate a uniformly large scale for towns, parishes, and counties, however; it might be considered whether in those cases different scales might not be adopted.

Most of the states of Europe have government surveys on a large scale. In some countries these are treated as military maps, and in others portions of the survey are sold at a low price to the public. Austria, Bavaria, Belgium, Denmark, France, Holland, Prussia, and Russia are surveyed in whole or in part, either on the scale of 25:344 inches to the mile, which gives one inch to each acre, or on that of 13:680 inches to a mile, excepting Denmark, which is surveyed partly on the scale of 15:84 inches, and Russia, which is partially surveyed on the scale of $7\frac{1}{2}$ to $3\frac{1}{4}$ inches. Sardinia has decided on a cadastral survey of 42:24 inches to the mile, whilst Wurtemberg has completed and published a survey to the scale of 50:688 inches to the mile.

Some of the countries referred to have undoubtedly carried matters to extremes; but with the experience already gained, and the clearly given opinions of practical and professional men, it seems certain that we cannot err in regard to the best mode of proceeding. The Committee which has just furnished its report to the House state, that they regard it "as a settled point, that for the purposes of this enquiry the term 'cadastral' means a survey on the scale of 25:344 of lineal measure of the ground, from which plans on that or any smaller scale can be drawn."

There is no doubt that the Committee did well in accepting this arrangement as a fixed point, for the scale in question offers many advantages in the primary survey, and many facilities for reduction afterwards to any scale which may be desired for particular localities.

During our recent visit to the Ordnance Survey Office, at Southampton, we were struck with the ingenious and yet simple means by which plans were reduced. Photography of course is enlisted by the operators in this case, and marvellously well does it perform its task. It does not err, as skilled labour of the most superior kind not unfrequently does, but gives instantaneous and truthful results.

Some witnesses suggested to the Committee in question that the surveys should be made, but the results not published. They recommend that the original map should be deposited in some accessible place, and that persons desirous to obtain copies should be allowed to do so on payment of a certain fee. The Committee express their belief, nevertheless, and in that belief we heartily concur, that taking the average of the whole kingdom, a sufficient number of copies will be sold to defray the expenses of publication. In truth this idea seems to be justified by facts. When the manuscript plan of the ground is completed, the expense of preparing plans on the 25-inch and 6-inch scale respectively is as follows:—

One sheet on the 25-inch scale contains 960 acres, one sheet on the 6-inch scale, 15,630 acres; one sheet, therefore, on the 6-inch scale represents exactly the same area of ground as 16 sheets on the 25-inch scale. The cost of producing one sheet on the 25-inch scale is computed to be £4. The cost of producing one sheet on the 6-inch scale is sixteen times £4 — £64. In other words, the cost of production is the same on both scales for an equal area. The

25-inch plans are transferred to zinc or stone — zinc being principally, if not entirely, used at present, and the 6-inch plans are engraved on copper, after being reduced by photography. The difference of price between one sheet on the 25-inch scale, and one on the 6-inch scale, is owing to the greater amount of skilled labour expended on the copper-plate engraving, as compared with the zincographic process.

When once the Cadastral Survey is completed, revision would be needed, say, once in fourteen years. This would cost less than the rate of £10,000 per annum, an amount which it is fair to suppose would be covered by the profit on the sale of the maps.

It is difficult to imagine that any objection will be raised in the House of Commons to the carrying out in its entirety the Cadastral Survey of England. In every way it will be advantageous to have it made, and that speedily. There may have been room for two opinions amongst our representatives as to the propriety of transporting the Natural History Department of the British Museum to South Kensington, at a cost to the nation of £600,000 or £700,000, but there can scarcely be so upon the propriety of proceeding with the Ordnance Survey.

When completed, the Ordnance Maps will form a picture of the country, as far above the value of the renowned Domesday Book of William the Norman, as is the civilisation and scientific knowledge of the subjects of Queen Victoria above those of the subjects of the Conqueror. In short, it will be a work worthy the age and the nation.

ABRIDGEMENTS OF THE SPECIFICATIONS RELATING TO BRICKS AND TILES.

(PRINTED BY ORDER OF THE COMMISSIONERS OF PATENTS.)

THIS volume belongs to a series of similar collections of abstracts which the Commissioners of Patents have been publishing for some time back, and which now includes a considerable number of volumes, each on a distinct subject. It may be desirable to give some account of the circumstances which led to these publications, or, in other words, of the labours of the Commissioners during past years, before noticing the particular volume now under consideration.

Most of our readers are aware of the fact that, among the conditions necessary for obtaining Letters Patent to secure an invention, it is essential that a specification of the nature of the invention and the mode of putting it into operation shall be lodged in the Patent Office. This has been, more or less, the custom from near the time when the very first patents were granted, and as the specification, with its accompanying drawings, forms the basis upon which any supposed infringement of the invention is examined and disposed of in a court of law, it is clear that a comprehensive and accurate description of the nature of each invention must be embodied in each specification, in order to render the document available. To a great extent this is the case, and hence it can be easily understood that a body of valuable information has been gradually accumulating in the storehouse of patents; information valuable as embodying a history of discovery, invention, and art in this country, as containing descriptions of innumerable inventions the patents for which have expired, and which it is open to all the world to appropriate, and as showing to inventors in any particular branch the nature of all such inventions as have already received patents, so as to enable them, if intending to become patentees, to see whether or not their inventions have been forestalled.

The actual examination of these numerous and voluminous documents, entered numerically in books, and stowed away in several very inappropriate receptacles, was, however, a matter virtually impossible without some guide or clue to them, and this clue was provided by the energy and perseverance of Mr. Bennet Woodcroft, now Superintendent of Specifications, &c., under the Commissioners, and formerly Professor of Mechanics at London University College. He prepared three catalogues, or indices to the specifications, arranged with the greatest care, patience, and skill, of which one was an alphabetical index, a second a subject-matter index, and the third a reference index, giving a reference to the passages in scientific periodicals in which each invention down to a certain date was described or elucidated.

This step, in itself of great importance, was followed by the introduction of the custom of printing all the specifications as the patents were taken out, and engraving the accompanying drawings; and when this had been found to be appreciated by inventors and the public, it was decided to print the specifications of the earlier patents back to the very commencement. This has been in progress for a considerable number of years, and is either actually accomplished, or is on the eve of completion.

The specifications on any one subject, however, form a numerous and consequently a costly series; and, notwithstanding the facilities for

consulting the complete printed series at the library in the Patent Office, and the numerous free libraries, the establishment of which has been promoted by the Commissioners, it has been felt that in many cases inventors were not able fully to realise the advantages proposed for them; any entire series of patents being too costly for purchase, and the short descriptions in the indices not being sufficiently detailed to indicate what individual patents bear upon any one point. The happy idea was therefore conceived of publishing abstracts of the specifications in classified series, these abstracts leaving no essential point unnoticed, but conveying as briefly as possible such information as will give an exact idea of the scope of the specification itself, and of such of its details as form novel or distinctive features.

The preparation and publication of this series of abstracts is now going on, under the superintendence of Mr. Woodcroft, and the first series published was one which related to inventions of a nature to bear more or less directly on building operations, namely, those concerning drain tiles; this has been followed by various series on various important subjects, such for example as steam navigation, steam culture, fire-arms, &c., and lately by the volume before us, which is the second of those that more particularly concern the builder.

Bricks and tiles seem simple in their nature, their materials, and their manufacture, and yet we find that, up to the end of the year 1860, there had been somewhat more than 500 patents taken out for inventions of which they were the subject. Of these inventions, some relate to new materials; others to new shapes, forms, or sizes; others to methods of tempering the raw materials, or drying and burning the manufactured articles; and others, these being the most numerous of all, to various inventions for the manufacture of bricks and tiles by machinery. The book, like all the other series of abstracts, will be almost indispensable to inventors of bricks or brick machinery; it will also be very useful to manufacturers, and even to architects and builders, as showing them what methods of manufacture have been tried, and what forms, patterns, sizes, and qualities of bricks have been devised. It is hardly, perhaps, necessary to add, that the series will not do more than this, it is not intended to guide its readers to a discrimination between those patents which have proved to be of practical value, and those which are not at present being worked; in fact, it would be almost impossible to procure such information complete, and unfair to pretend to give it, except in a complete form.

We may add, that to these specifications which, arranged in chronological order, form something like a history of bricks and brick-making in this country, from the year 1619 to the present day, there is prefixed a brief but comprehensive introduction, carrying the reader back to the earliest known accounts of the manufacture and use of bricks and tiles, and tracing the history of their employment, and of the modifications which they have received from that time downwards; of this introduction our readers have had an opportunity of judging for themselves in another part of our columns.

It is to be hoped that this series will be speedily followed by others connected with building, such, for instance, as inventions connected with mortars and cements, heating and ventilation, and new materials and contrivances of various descriptions; and in fact, some such promise is held out by Mr. Woodcroft in his preface, in which he says:—"A limited number of the present Abridgements relate to improvements in building contrivances or materials which will form the subjects of distinct series; they were, however, necessarily included here, because some portion of them refer to bricks or tiles."

INTERNATIONAL EXHIBITION.

THE PICTURE GALLERIES.

HAVING mentioned in the previous number several pictures contributed by the foreign schools to which we can produce no equals in the same style of art, we will now proceed to select from the works of the English school such pictures as we think cannot be equalled by those from the continent. First among the fathers of British art, stands Hogarth—not only original in choice of subjects as a painter, but in truth the first openly declared foe to vice amongst us; also the first who devoted his talents to mitigate cruelty inflicted upon animals. His works upon those subjects have never been approached either at home or abroad. His imitators in England were few, and merely resembled him near enough to make his merits by the comparison more conspicuous. Collett was perhaps the most successful of them, but his attempts show more the ambition to be a painter, than the possession of the pictorial gift so indispensable to make one—a gift which was so remarkably manifested in Hogarth. Like all self-taught men he entertained strong opinions upon the art he had acquired. He published those opinions in his well-known book entitled "The Analysis of Beauty," and such were his natural abilities, and so practical was the manner in which he employed them, that after the first part of his book had been revised by a literary friend, Hogarth had

watched the operation so closely, and had applied all that he learned from it so cleverly, that when the manuscript of the second part was submitted to the same friend, he found scarcely a word to change, or a sentence to alter. It was no doubt the application of his common sense to the treatment of his subjects, that induced him to adopt a low tone of colour in his pictures, where expression and character were his principal intention; and that that practice was sound, we may see in this Exhibition, by looking at the small interior and domestic subjects by Madou, of Belgium, and those by Bles, the *genre* painter of Holland. For this apparent want of colouring, Hogarth has been censured by English critics; but if he has sinned in that respect, it has been committed in most excellent company; for many others have adopted the same method of colouring, besides those we have mentioned. Hogarth thus stands entirely alone in the choice of his subjects, and especially so in the systematic manner in which he attempted to reform the morals and check the cruelties of his own time. Generally excellent as the light is in the large rooms of these galleries, it is to be regretted that his pictures could not have been better placed. Most of them are hung too low, and nearly all are hidden in a comparatively dark corner of the room.

The real founder, however, of the school of British art was indisputably Sir Joshua Reynolds; and although there have been portrait painters in all countries, we think from no part of the world can pictures equal to his be seen, and in which the same grace, delicacy of expression, and elegant arrangement can be found; but the superiority possessed by Reynolds over all other painters of portraits consists in this:—Besides seizing the character and expression of his sitter, so that all who knew him should recognise the likeness at the first glance, he at the same time produced a picture that all the world could admire as a work of art, without their even wishing to know for whom the portrait was intended. It is in this that Sir Joshua is unrivalled by any work in the present Exhibition or elsewhere. Gainsborough stands alone both as a landscape and a portrait painter. The celebrated "Blue Boy" bids a bold defiance to all comers. It is an interesting fact that this, the finest picture of the kind ever painted, should be the result of antagonism to a rival and a perversion of one of his rules. In short, a mistake. Sir Joshua, in one of his celebrated "Discourses," laid it down that if blue he made the key colour to a picture the general effect must necessarily be cold. When he wrote that, he had in his mind a composition consisting of several figures, in which, if the principal figure wore a blue dress, that colour, to connect him or her with the rest of the subject, must reappear in various parts of the subject; not only so, but if the blue, being a cold colour, were to be maintained as the key colour, all the warm tints must be subordinated to it. Hence there would be an undue prevalence of cold colour and of warm colour toned down to agree with it; and therefore, in comparison with other pictures painted on a different principle, a cold effect would be the consequence. Gainsborough, disliking Sir Joshua too much, and being too eager to prove him wrong, without inquiring into the true meaning of the rule, painted a picture of one figure, not several; that figure he dressed in blue satin—not contemplated by Sir Joshua—surrounded by low-toned warm colour, as a contrast, not an accordance relieved the whole with deep greys, which, with the sudden and dark shadows of the satin, and its equally sudden and bright lights, produced an effect, not of extended harmony, but of a brilliant and dashing piece of *chiaro-oscuro*, in which the blue was considered as the local colour, rather than as the key to the whole. If, however, all the perversions of the rules established by Sir Joshua Reynolds had been attended with results so splendid and so honourable to English art, they could well claim the forgiveness that poor Gainsborough on his death-bed asked of the man he had so opposed and misrepresented during the greater part of his life.

His attempt to render Sir Joshua ridiculous in this instance was as reasonable as if it were endeavoured to be proved that the plan of a general battle were absurd, by showing what a single individual could do under extraordinary and peculiar circumstances. Besides the "Blue Boy," "The Girl and Pigs," and the "Girl going to the Spring," for rural poetry in feeling and treatment, we know not the work of any foreign master in the present Exhibition, or out of it, that can for a moment be compared with either of them, or with his lovely and famous picture known as "The Cottage Door."

Morland, who was nobody's enemy but his own, can also, in rustic sentiment and painter-like treatment, challenge any foreign competitor. He was unfortunately his own enemy, both in a moral and a worldly sense, and by the latter his fame as an artist has seriously suffered, for few know the delicacy of his style in early life, or the depth and power of his pencil during his meridian, and too many know only the slovenly and hasty smears and scrawls for bread in his latter days. The pictures by him in this Exhibition will no doubt redeem his fame, but he is not represented as he might have been. The "Landscape and Gipsies" is both fine in composition, uniformity of tone, and facile execution, which is so charming in him when it is not carried to excess. No painter ever excelled Morland in rendering the leafy character of wood scenery. No. 103 is an admirable example of this style of painting; the arrangement of the parts is also fine, and the general tone of the colouring will illustrate our remarks on his unity of effect, and the group of sheep under a glass that hangs near to it will show the delicacy and breadth with which Morland could paint in his best time.

The classical style of Wilson does not stand so distinctly apart from several foreign painters who could be mentioned, but in all his compositions of this kind it will be seen that he sustained the feeling throughout with both

taste and power, and in his pictures of a less pretentious character, as the "River Dee" and the "Frith of Forth," in the present exhibition, his love of home and rural scenery is charmingly displayed. It is in this home feeling that English landscape painters excel those on the Continent. The latter, although they are excellent as works of art, and elevated rather above the reality into a kind of rural sentiment, seem to be painted by a stranger; while the landscapes in England by Englishmen have an air of homeliness about them very congenial to the national mind. Thus the classical compositions by Wilson have not so many general admirers as his views at home taken from known localities, because we have no natural sympathy with them. It is the same with the pictures of "Old" Crome now exhibited, while we admire the firmness and vigorous effect which they present, they remind us too much of Hobbins, to produce the full impression of home to give all the pleasure they might. His view of "Moushold Heath," although barren in subject, is more in accordance with our feelings, because it suggests nothing but the reality, and that reality evidently in England. There are, however, few foreign painters of out-door scenery can equal Crome as a landscape painter. Of the pictures by Calcott we may well be proud, for, besides that congenial aspect which induces us to sympathise with them, they have a fine expanse of atmosphere, great unity and breadth of tone, besides being scientifically composed. We would direct attention particularly to a "Sea Piece," and "Shipping on the Thames." The pictures want cleaning to show their true atmosphere. They are badly placed in the gallery for exaggerating their tawny appearance, in consequence of having the ventilators close below them, which, when open, allow the clear daylight to be seen, and rendered more brilliant by contrast with the black and positive forms of the iron-work; and not only is the yellow varnish upon them increased in intensity, but the eye of the spectator is dazzled by the vividness of the daylight, and at such times it is quite impossible for these fine English pictures to be seen at all. Between the works of Wilson and Calcott is a charming little picture of a "Farm Yard," by a native artist little known, H. Walter; but for delicacy of feeling and appropriate sentiment in the treatment, few of the foreign painters of the same subjects can be brought into comparison with it. Benington's "Venice," and his other pictures in the Exhibition, do credit to the English school. The paintings by Nasmyth, although too evidently founded on the old masters to be strictly native, still he has applied the materials he obtained from foreign sources with so much judgement, taste, and skill, that he may be mentioned in connection with the leading artists of the British school; some of his pictures are very delightful for the purity of their atmosphere, and the spirit with which they are touched.

Constable, as an original genius, besides having given the tone of French landscape painting, stands unrivalled, both by them and his own countrymen. Time has done him the justice which his contemporaries refused, when his pictures, fresh from the easel, appeared speckled all over with spots of light colour, which he said twenty years would tone down. Visitors may now see how the prediction of the painter has been verified. In "The Hay Wain," we have the perfection of landscape painting of the most rural kind. "Salisbury Cathedral" is another fine example of his style; "Flatford Mill" also; but the "Opening of Waterloo Bridge" would require a lengthened description to make all its pictorial beauties intelligible to the uninitiated. It will be sufficient at present to direct attention to the manner in which the sentiment of the subject has been sustained throughout. It is a scene of pomp and gaiety. In the foreground are state barges, with their gilded sides. On the platform above the cabin are crowds of people, surrounded by numerous banners waving and fluttering in the wind. It is worth while to examine and note the original method of producing that effect, with the appearance of motion given to the state barge and all it contains, as if passing before the eye. Neither Baekhuysen nor Vandervelde ever thought of making the attempt which Constable has here carried out so successfully. Every part of the picture is in motion. The water is broken into little dancing wavelets by the craft in the foreground, the sun gleams out through the somewhat showery-looking clouds, and the signal gun from the bridge in the distance sends forth its wreath of white smoke, which, while it is suggestive of the subject, forms the central and key white of the whole composition, which, when viewed as a whole, presents an aspect so elegant and brilliant, that it may safely defy foreign competition. In the "Cenotaph at Cole-Orton, in Memory of Sir Joshua Reynolds," Constable has put forth all the solemn and quiet graces of his pencil, and has, if possible, exceeded the powers of the marble, by the refined feeling in which he has treated it, in paying homage to the talents of the father of English art, and the first President of the Royal Academy.

We have not yet exhausted the list of English painters who can be advantageously compared with those of the Continent.

WORCESTER.—It has long been doubted that Worcester was a Roman station, but a recent discovery in Copenhagen Street there, has proved that it was. Remains of an ancient roadway, and the bases of two columns, standing about 7½ ft. from each other, have been found in digging the foundations for the new Police-Station, at the east site, eight or nine feet from the frontage of the present street, seven feet below the surface. The bases of the columns are of sandstone; the columns have been broken off. They were of rude workmanship, but their Roman type was unmistakable.

MANBY HALL.—We are informed that Manby Hall, one of the seats of the Earl of Yarborough, after a careful inspection by an architect, is doomed to demolition. The house is somewhat inconvenient and very ancient, having stood the test of time for several hundred years.

RESTORATION OF THE CHAPTER HOUSE OF WESTMINSTER ABBEY.

ON Saturday last, a meeting of noblemen and gentlemen, convened by the Very Rev. the Dean of Westminster, Dr. TRENCH, was held in the Chapter House of Westminster Abbey, to take into consideration the steps desirable to call public attention to the ruinous condition of that beautiful building, with a view to its restoration.

The meeting, although a preliminary one, was very numerously attended, and amongst the noblemen and gentlemen present we noticed: Lord Ashburton, Lord Stratford de Redcliffe, Lord Taunton, Lord Talbot de Malahide, the Bishop of Oxford, the Bishop of St. Andrew's, the Bishop of St. David's, the Dean of Westminster, the Dean of York, Sir William Heathcote, Bart., Sir David Dundas, M.P., Mr. Baillie Cochrane, M.P., Mr. Tite, M.P., Vice-Chancellor Sir William Page Wood, Mr. Hubbard, M.P., Mr. George Gilbert Scott, Mr. James Fergusson, Mr. Joseph Clarke, Mr. George Godwin, Mr. Charles Forster Hayward, Rev. Thomas Hugo, Mr. M. J. Lomax, Mr. T. Hayter Lewis, Mr. E. M. Barry, Mr. Beresford Hope, Rev. Mackenzie Wallace, Mr. Arthur Ashpitel, Mr. James Bell, Mr. Henry W. Sass, Mr. Bailey, Mr. J. H. Parker, Mr. Aekroyd, Mr. G. A. Sala, Rev. W. Scott, Rev. Benjamin Webb, Mr. Henry Reeve, Mr. Cooke, Mr. Knight Wilson, Mr. R. T. Cox, Mr. W. C. Cox, Mr. Martin Sharp, Mr. George Richmond, Mr. S. Tillet, Mr. D. Dasent, Mr. Dyce, &c.

On the motion of the Dean of Westminster, Lord Ashburton was called to the chair.

The CHAIRMAN, before opening the proceedings of the meeting, mentioned that he held in his hand a letter from the Duke of Buccleuch, high steward of Westminster, regretting exceedingly that he was not able to attend on the present occasion, and stating that he was quite ready to join in any proceedings likely to promote the object of the meeting. They had all reason to thank the Dean of Westminster for having called them together on that occasion; his pious zeal for the great monument left in his charge had extended to the Chapter House, which had for some centuries been withdrawn from the superintendence of the Church. They all of them knew that the Chapter House was built in the best time of Norman architecture, that it was, at a period when religion and civil government were more strictly united than now, taken by the crown for the meeting of the Houses of Parliament. It remained in that destination until the time of Edward VI.; it was then used as a Record Office, and it had gradually become defaced, as they now saw it was. It had been pronounced by Mr. Braidwood as unsuited to hold papers of value, owing to its liability to fire, and the question arose, to what purpose could it be applied, and whether it was to be a rubbish heap, or restored to its former beauty as a gem amidst the glorious monuments which either the piety of former ages, or the revival of art in our own day, had grouped about that spot. If they lived in France, they would only have to apply to some gentleman having influence at the Court, and then probably the Emperor would order, as he did in the case of Le Chapelle at Paris, the building to be completely restored. But they happened to live under a constitutional government, and a constitutional government has other modes of procedure. The Queen was almost powerless as to carrying out the object in view; the Government was almost powerless, for, to obtain funds, a proposition would have to be made by the Chancellor of the Exchequer or the Prime Minister to the House of Commons. It would, therefore, seem the most desirable thing to appeal to public opinion, and should the Government propose a measure for the restoration of the ancient building, they would then probably have a full and ready support from all the members of the House. Meanwhile, they might take another course, and it was for the meeting in its wisdom to decide what that course should be. The noble Lord concluded by calling on Mr. Scott to put the meeting in possession of the position of the building, and of the state of the various parts of it, which would enable him as he thought, to restore this monument exactly as it was in ancient times.

MR. GEORGE GILBERT SCOTT said, he had no doubt the great majority of the gentlemen present were gentlemen who had given a certain amount of attention, and many of them a great deal of attention, to the subject of mediæval art. To them, therefore, it would be no matter of surprise to be told what the Chapter House in which they were assembled once was. But if there were any present who had not made themselves cognisant with architecture and antiquarian matters, he thought it would be a matter of surprise to be informed, that the miserable place in which they were assembled, which appeared to be like something between a dissenting chapel and a warehouse, had been, and might be again, one of the most beautiful specimens of mediæval art. Everything, except the central column, was so hidden by the barbarous innovations which had been introduced, that no one could imagine the building was once one of so interesting and beautiful a character. The Abbey, which was built, not founded, by king Edward the Confessor, was commenced to be rebuilt by Henry III. in 1245, which was just the period when the earliest variety of pointed architecture was merging into the second or more mature form it passed through. Therefore, this part of the Abbey was not only a valuable specimen of ancient art, but one of the most valuable historical specimens, for this reason, that the style in which it was built was supposed to have been imported from France, but upon that point there was a controversy. Through the aid of Mr. Burt, he had got to know that the building was erected, or rather finished, in 1253, exactly the same date as that of French buildings of a similar character, which showed that we were not behind the French in buildings of that description. In 1253 it was almost the first of the finer specimens of octagonal

chapter houses; that at Lincoln preceded it by half a century, but it was not so fine in all its development. That at Salisbury was later, and the Chapter House of Westminster stood the first both in date and beauty. It was 60 ft. in diameter, the same as that at Lincoln, and it was established on the strictest system of mathematical proportions. He had spent several months in tracing out the original design, and he thought that, with the assistance of Mr. Burt, he had found guides and vestiges remaining, which would render it possible to restore every portion of the building with perfect certainty. (Hear, hear.) The roof had been of polished Purbeck marble, and the floor happily remained absolutely perfect, and was one of the finest specimens of an encaustic tile floor remaining; in fact, he did not think there was anything equal to it. As to the question of the stability of the building, the groining was taken down about the time of Sir Christopher Wren, because of its unsafe state, which led to a pier giving way on the western angle, and there was no doubt it was on account of the groining giving way. It was probable, therefore, that in the restoration of the Chapter House it would be requisite to restore the pier referred to. There was no doubt whatever, that the building might be made perfectly capable of carrying the weight of the vaulting. Externally the case was very different from that of the interior, but happily not so very different as at first might be imagined. Till they got to the parapet and the pinnacles, they could recover the original design. The whole of the interior could be restored, and the whole of the exterior, with the exception of the parapet and pinnacles, the construction of which must be guessed at, as much as possible, by reference to contemporaneous works. He then went into another question, how far the decayed mouldings in the interior ought to be renewed. And his opinion was, that where they were not so far decayed as to destroy their design, they should not be renewed, but have applied to them a hardening solution, carefully passing by degrees to renew where renewal was requisite; but wherever the original design existed it should not be interfered with beyond the application of a hardening process. He could give his strongest possible opinion that when properly restored, the Chapter House of Westminster Abbey would be one of the most interesting and exquisitely beautiful buildings this country possessed.

LORD STRATFORD DE REDCLIFFE said, the object of the meeting had been well explained to them by the noble President, and the statement which had been made by the illustrious architect, Mr. Scott, was such as to lead every one to see the importance of the building in which they were then assembled, and he was sure they were all happy to hear of the facilities afforded for its being restored to its original state. Of course there must be great difficulties in carrying it strictly into execution, but if he understood Mr. Scott properly, the main points of the building were capable of complete restoration without any great trouble. That being the case, any addition that might be required from the long lapse of time, was comparatively of little importance, and the interest which attached to such a building as the Chapter House of Westminster Abbey could not be overlooked by any gentleman. We owed to those who had gone before us, to neglect no opportunity of preserving and restoring the buildings they had left us. There were circumstances connected with the building in which they were assembled, which commended it to their careful consideration. The high style of architecture of the building showed the object for which it was constructed, and when they remembered the power of the clergy at the time of its construction, they might well imagine the important discussions which frequently took place in the Chapter House. And then the building had been the House of Parliament, and no doubt, and even according to tradition, the voice of eloquence and of patriotism were frequently raised in that room, even to the interruption of the religious services in the neighbouring cathedral. He had to move the first resolution:—"That this meeting views with regret the ruinous condition of a building so interesting, both as a historical monument, and for its original architectural beauties, as the Chapter House of Westminster."

MR. BAILLIE COCHRANE, M.P., in seconding the resolution said, he trusted the object of the meeting would be a successful one. The resolution stated that the ruinous condition of the Chapter House was to be regretted, but he thought it ought to have gone further, and said that they looked upon the condition of the building with shame. He thought it was a disgrace to the country that our public monuments should be left in the state they were. They often heard the severe criticisms of foreigners on the state of our public buildings, and he did not think their criticisms were too severe. A building like the Chapter House in which they were assembled was a national one, and though situated in the metropolis, the whole of the country had an interest in it. As to the restoration of this monument, he thought they ought to go to Parliament for the money requisite (applause), and he was of opinion that if Parliament refused £20,000 for its restoration, it would be a disgrace to the country.

MR. WILLIAM TITE, M.P., supported the resolution. He said nothing could give him greater pleasure or excite stronger emotions of gratitude in him, as an architect, than to be present at such a meeting, and he thought they were much indebted to the Dean of Westminster for his perseverance in the matter. The first meeting held on the subject comprised only four individuals, but now they had a meeting consisting of large numbers of members of both Houses of Parliament, and of the literature of the day. He could not believe that in England, and with the great interest which the restoration of mediæval art had excited throughout the whole country, there could be any difficulty in obtaining funds requisite for the restoration of the Chapter House. It was a disgrace to England that, living as they did in a city having a population of three millions, there should be a

building like the Chapter House of Westminster in so dilapidated a condition. He was not surprised at the criticisms of foreigners. As to obtaining funds from Parliament for effecting the proposed restoration, he was not so sanguine as his honourable friend Mr. Baillie Cochrane. He trusted that the present meeting would lead to such results as they all desired and hoped to see effected.

The resolution was put from the chair and unanimously agreed to.

LORD TACROX said it would be a disgrace to this country if it allowed a building so interesting and so full of historical recollections as the Chapter House of Westminster to go to decay, for it was one of the most interesting monuments we possessed. He thought, from the very satisfactory and interesting speech of Mr. Scott, they might hope there was really no practical difficulty in carrying the proposed restoration into effect. It appeared that there was no practical difficulty, but there was the financial difficulty; and he owned that he was not so sanguine as Mr. Baillie Cochrane, that the Government or the Legislature would find the requisite money. However, whether that was so or not, he was convinced that the object they had in view was so right and just in itself, it would be successfully achieved. The present was not a very favourable time for a public subscription, but he was satisfied that at no very distant period of time, an object so just and so reasonable in itself would commend itself to the public spirit and good sense of the country, and that they should be able to command those funds that were requisite for the purpose. He should like Mr. Scott to state what would be the probable cost of putting the building in a proper state of repair. Looking at how much beauty, how much proportion, and how much interest attached to the building, it would be a scandal to the country to allow it to fall into decay. He had had the pleasure of seeing the chapter house of Salisbury restored, by private subscriptions, he believed. Surely a similar procedure could take place at Westminster, and it would be a great scandal to them if they did not provide the means of putting the Chapter House into a proper condition. His Lordship moved, "That this meeting is impressed with the desirableness of bringing the question of the restoration of the Chapter House at Westminster, under the attention of Her Majesty's Government, as well as of Parliament, and the public generally."

DR. DASENT seconded the motion, and in so doing said, he thought it would be unsafe to depend upon Government or Parliament for funds, but there was another source to which they might direct their attention, and that was the Ecclesiastical Commission. (Roars of laughter.) Well, he should insist, that if possible some sum from that body should be obtained. But supposing all other sources failed, they must fall back on the public generally, and he could not doubt that if this matter was properly brought before the public, there would be no difficulty in raising the requisite amount. Of course it was desirable that the public should have information as to the sum that would be requisite for the restoration.

MR. GEORGE GILBERT SCOTT said he estimated the cost at about £20,000.

MR. DASENT said he did not think the public would hesitate to raise the sum of £20,000, without calling upon the Government, the Parliament, or the Ecclesiastical Commissioners for aid. He had great pleasure in seconding the resolution, and had no doubt that from the public alone the requisite money would be obtained.

The Right Rev. the Bishop of Oxford supported the resolution. He said he understood the object of the meeting was, as it were, to feel the pulse of the public, and to ascertain whether they considered their object worthy of an effort for its accomplishment. It had been suggested that an application should be made to that "milch cow," the Ecclesiastical Commissioners; but as the ownership of the Chapter House rested with the Government, its restoration could not come within the provisions of the Act under which the Ecclesiastical Commission was appointed. But, looking to the fact that the Chapter House had become the property of the nation, and that so much had been done for the new Houses of Parliament—knowing also the determination to link the present with the past—he thought they had a claim, or, at all events, that something ought to be done, for the preservation and restoration of what was in fact the House of Commons in the early Tudor dynasties. The most likely way to succeed was to let it be seen that a large amount of public interest was manifested in the form of voluntary contributions. They might then call upon Parliament for a vote in aid. At the same time he admitted they had no prescriptive claim upon that assembly, and that if it made any grant it would be an act of grace.

MR. HUBBARD, M.P., thought the resolution was not sufficiently precise in its terms, and thought that the public ought to know clearly the sources from which the money was desired to come. After a short discussion it was agreed to that the words "Parliament and the public generally" should be omitted from the resolution.

The resolution in the amended form was passed unanimously, it being understood, however, that the promoters of the meeting would be at liberty at any future period to adopt such independent measures as to soliciting public aid as they might deem expedient.

MR. A. J. B. BERESFORD-HOPE moved the appointment of a Committee to nominate a deputation to wait upon the Chancellor of the Exchequer, for the purpose of presenting a memorial to the Lords of the Treasury, and taking such other steps as were calculated to promote the objects of the meeting.

MR. GEORGE AUGUSTUS SALA seconded the motion. MR. REEVE supported the motion, which was put from the chair, and unanimously agreed to. The following were appointed the Committee:—The Duke of Buccleuch, Lord Ashburton, Lord Stratford de Redcliffe, Bishop of Oxford, Mr. Cockerell, Mr. Tite, Lord Taunton, Lord Stanhope, Mr. Dasent, Mr. Hubbard, Mr.

Beresford Hope, Mr. Sala, Mr. Reeve, Mr. Monckton Milnes, Mr. Ackroyd, Mr. Cochrane, and the Dean of Westminster.

The following is a copy of the memorial to be presented to the Chancellor of the Exchequer, by a deputation from the Committee:—"To the Lords Commissioners of Her Majesty's Treasury: The Memorial of the undersigned sheweth that the undersigned residents in and visitors to London view with great regret the dilapidated and ruinous condition of the Chapter House of Westminster Abbey, a building which has been for many centuries in the occupation of the Government, and which is alike valuable for its architectural beauty, and for the historical interest attaching to it as the political place of meeting of the House of Commons during the Plantagenet and early Tudor dynasties. That your memorialists would further represent to your lordships, that the grievous injuries which this building has suffered have been mainly inflicted upon it in the adaptation of it to the custody of public records, and that the records which it formerly contained have now been removed to the head Record Office, while the Chapter House itself has been declared by competent authority to be unfit for the custody of papers from the risk of fire which it presents. Your memorialists, therefore, venture respectfully to suggest, that advantage should be taken of the present occasion to forbid the use of the Chapter House for objects for which it is peculiarly unfit, and to prepare the way for its future restoration. The mere removal of the incongruous fittings with which the building has been crowded would bring to light many of its ancient and ornamental features. Your memorialists further venture to suggest that the restoration of a historical memorial of so much beauty and importance, is an object for which your lordships might well, in the exercise of your discretion, invite the liberality of Parliament." The memorial was signed by most of the noblemen and gentlemen present, and now lies for signature at Messrs. Vacher's, 29 Parliament Street; Messrs. Colnaghi's, 13 Pall Mall E., and Mr. John Henry Parker's, 377 Strand.

LORD TALBOT DE MALAHIDE, in moving a vote of thanks to the noble Chairman, expressed his opinion that, in point of justice and of right, they had a very strong claim on the Government to be at the expense of restoring the Chapter House.

MR. ACKROYD seconded the motion, which was carried by acclamation.

The CHAIRMAN briefly acknowledged the compliment, and the meeting separated.

ARCHITECTURAL ASSOCIATION.—MR. R. P. SPIERS ON ARCHITECTURE IN NORMANDY.

AN ordinary general meeting of the Architectural Association was held at the rooms, 9 Conduit Street, Regent Street, on Friday evening; Mr. THOMAS BLASHILL, vice-president, in the chair.

The minutes of proceedings at the last meeting were read by the hon. sec. Mr. J. C. ADAMS, and confirmed.

New Member.—Mr. Henry Louis Florence, 30 Brixton Place, Brixton Road, having been balloted for, was duly elected a member of the Association.

Nomination.—Mr. R. H. Burden, 3 Brewer's Street, was proposed for membership, and will be balloted for at the next meeting.

ARCHITECTURE IN NORMANDY.

MR. G. B. NEW being unavoidably prevented from addressing the meeting on the subject of "Roofs," which he had intended doing this evening, Mr. R. PHENE SPIERS, M.I.B.A., delivered a lecture, which he described as "A Sketching Tour through Normandy," during the month of October 1861. The lecture was illustrated by a great number of drawings, engravings, and lithographs. The lecturer commenced by referring to a visit to the cathedral of Rheims, and one of the things which struck him there was that the side aisles had no chapels, and he was told that that feature prevailed throughout Champagne. Those chapels had, he believed, nearly always been added to the cathedrals in the fourteenth century, as at Notre Dame at Paris and Amiens. There was, therefore, less effect in Rheims cathedral, as regarded extent and size, than in the other two mentioned, but the deep shadows thrown by strong buttresses on the exterior added greatly to the beauty of the architecture. In the inside there was a small passage, about 2½ yards from the ground, which passed round the whole church, there being small doorways cut through the piers. There was a range of three stone seats in each of the side aisles. In the Rue de Tambourg was a very singular building, known as the house of the musician, of which the first story only exists as originally built. Between and on each side of the four windows are five niches with pointed arches, in which are placed sculptured figures playing different instruments. The figures are seated, and their seats supported by Gothic corbels. The cornice is also very good. The Hotel de Ville is of the time of Louis XIII.—XV., seventeenth century renaissance, but has been scraped and restored since. It is a stone building, ornamented with pilasters and brick, of very good proportions, and with a great deal of character about it. Not far from the station exists an old Roman arch in a very bad state of preservation, which was a very curious monument, such relics not being found, generally speaking, so far north. Thirty yards north of this arch has lately been discovered an old Roman mosaic pavement, nearly perfect, and extremely beautiful, as it seems to have retained its colours in all their pristine force and beauty. It measures about 27 ft. by 31 ft., and is at present covered by a shed; but it is said an intention exists of establishing a museum on the spot. The church of St. Remi is very interesting, owing to the different periods at which it has been restored and added to. Its erection was commenced in the eleventh century, on foundations of a still more

ancient date. The choir was added at the end of the twelfth or beginning of the thirteenth century, and bears a remarkable resemblance to the choir of Notre Dame at Paris. The side aisles were originally vaulted with the circular arch rib-vaulting, but this was removed in the thirteenth century, and pointed ribs placed; raising the gallery, which takes the place of the triforium, about two feet. In the same century small columns to carry a vault were introduced in the nave, and flying buttresses were placed on the outside, abutting upon and partially hiding Norman capitals, added in the twelfth century. A hospital blocks up the aisle windows of the north side. The southern transept is of the fifteenth century. The choir contains a very beautiful tomb of St. René; and a most beautiful marble screen, in Italian renaissance, encloses the choir. St. Jacques is another very interesting church, commenced in the thirteenth century, added to in the fifteenth and sixteenth, and restored in the nineteenth century. The lecturer proceeded to state that he was obliged to return to Paris on leaving Rheims, there being no railway across to Mantes, the first town he wished to visit before going to Rouen. The church of Notre Dame, Mantes, was built towards the end of the thirteenth century; the entrances are earlier, at least the centre one and that on the left, the other being of the fifteenth century. The triforium resembles that of Notre Dame at Paris, with its wide gallery round. This produces a strange effect outside, especially on the north, because, there being no side chapels, the side aisles mount up twice the general height. The upper part of the circular window in the façade is elliptical, probably on account of the interior vaulting. Round the tower and across the front of the church is a covered gallery, which has a series of two columns with lintels between them, which rest on the inner wall. One of the towers, and the gallery across the façade, are additions by the present architect, M. Durand. There was another old tower in the town, of which the church does not exist. It is extremely picturesque, and of the sixteenth century; the style being renaissance in detail, but Gothic in general treatment. The lecturer said he scarcely ever describes Rouen, which was one of the most glorious old towns he had ever seen. With the exception of the church of St. Ouen, it was perhaps much more interesting to artists than to architects; it was full of and contained perhaps the finest reminiscences of the last period of French Gothic—the Flamboyant. Greater delicacy of carving, greater richness of imagination, greater fancy and poetry in the extravagant exuberance of the detail of this debased but most beautiful style did not exist, and yet all this was rapidly going to ruin. He was glad to see, however, that the French Government were propping up some of the old towers, and hoped that they would not take into their heads the idea of restoring them. Mr. Spiers said the cathedral has a very gorgeous façade of the fifteenth century unfinished, and it is flanked on either side by two towers, which he believed belonged to two churches previously existing, and probably of the twelfth or thirteenth century. He thought the church was of the fourteenth century: it had a false triforium, that is to say, the side aisles mount above the triforium, which opens out on them. There is a passage along it, carried round the piers of the arches on small columns supported by corbels. The chapel of the Virgin at the end of the church, contains some very beautiful tombs, particularly one of the Cardinal of Amboise, of the sixteenth century; and the sculpture was beautiful and delicate, and of great richness. The church of St. Ouen was a fine specimen of Gothic; certainly the purity of its architectural lines was wonderful, but the structure was cold—the work of a mathematical, rather than of a poetical architect. The choir is surrounded by a very beautiful ironwork screen of the seventeenth century, which, strange to say, is so beautiful, that, though of a different style, it does not at all jar the feelings at its being seen in a Gothic church. The church of St. Ouen had some thirty years ago a façade with two towers placed obliquely. There were about thirty-seven churches in Rouen, of which only fourteen were used for religious services; the others being either in ruin or used as stores. Two of the latter have only the towers remaining, the other parts, which were falling, having been pulled down. He believed they were going to plant gardens around them, as at St. Jacques in Paris. After remarking that there were in the town under consideration several beautiful fountains and some wooden houses, the lecturer said the Hotel de Boughterolde, which had been copied at Sydenham for the Renaissance Court, was a very beautiful specimen of the renaissance. The Palais de Justice, of the fifteenth century, and in the Flamboyant style, was one of the finest buildings in the town; and resembles the town-halls of Belgium, than those of France, generally speaking. The ceiling of the large justice-room was original and very rich, though much could not be said about its construction, and it was rather complicated. The church of Notre Dame de bon Secours was well worth a visit, as the whole of the interior was coloured; and being situated on a hill, it commanded a fine view of Rouen. The church of St. George de Bosherville, about six miles from Rouen, was a very interesting structure, and formerly belonged to an abbey built in the eleventh century. The church is vaulted, has side aisles, and a thirteenth century tower and spire. The ruins of a cloister of the same period exist on the north side of it. The greatest treasure was the Chapter House, an oblong building in the transition style, vaulted, square end, and with three pointed windows having zigzag ornaments. The façade has three circular-headed openings, the centre one a doorway, of which the architraves are ornamented with an extremely beautiful Byzantine, or perhaps even Moorish decoration. The Norman choir of this church is very interesting. Candebec was beautifully situated on a bend of the river Seine, and the scenery round about most lovely; and, in fact, he could scarcely recommend a more beautiful excursion than to proceed from Rouen to Havre by boat. There was a very fine church at Candebec of the fifteenth and sixteenth centuries, especially

interesting as showing the effect of the introduction of Italian architecture on the flamboyant, and the mixture of the two styles. The tower of this church is more beautiful perhaps than those to be found at Rouen. The chapel behind the choir has an ugly, shapeless pendente, but the organ loft is very well arranged. The ruins of St. Wandrille, near Candebec, are very picturesque, and present the relics of a very beautiful fourteenth century church of considerable size. There exists at present a portion of the transept, and the walls of the side aisle chapels. There is a large seminary uninhabited by the side of the ruins. Havre, now that the fine old tower of Francis I. has been destroyed, has no particular interest, except a modern museum and Town-hall, both very good specimens of French architecture of the present day. There is also to be seen here a new Romanesque church by a French priest. The lecturer then proceeded to state that he took the boat from Havre to Caen, proceeding up the river Orne. The banks from its mouth up to Caen are bordered with rows of trees, and, from the moment a person entered it, he might fancy himself in the interior of a country, the trees growing up to the sea-side. As he intended to revisit Caen on his return from Cherbourg, he went on at once to Bayeux. "Bayeux," said the lecturer, "is a town where the civilisation of the last ten years seems to have little entered. I think there is only one new house in the whole town, and some slight alteration in the cathedral is all that occupies builders or architects there. All the houses, therefore, are of a certain age. The oldest seem to have been built in the sixteenth century, and though not rich in decoration, are well built in stone. The most remarkable have staircases in towers attached to the houses, and have at the top a chamber which is higher than the rest of the house, and at which one arrives by a small staircase at a corner of it. The cathedral belongs to different epochs. The lower part of the nave and the towers are of the Norman period; and the three doors of the western façade are an addition of the fourteenth century. The most ancient part, the crypt, brings the visitor back to the eleventh century; and in it are to be found some beautiful capitals to the columns. The Norman arcades in the nave belonged to a cathedral of the twelfth century, and on them, in the thirteenth century, was raised a lofty clerestory without intermediate triforium. A matter worth note is that none of the Norman arches are exactly similar: some have the centre below the line of the abaci of the columns, and some above; their archivolts are not equal, and the intercolumniations are of different lengths. Caumont remarks that 'this irregularity occurs often in Norman churches of a large size.' The choir is one of the finest types of the thirteenth century architecture, and the disposition of four pointed twin arches is rare. Caumont puts forth his views as to the date of the tower, the mystery respecting which has been solved; for the year before I arrived, the piers being found to be in a bad condition, it was necessary to have them removed. The lantern at the top, of the seventeenth century, was taken down, and the fifteenth century part underneath was raised up bodily, under-pinned, and new piers added. In taking away the old ones, apparently of the fifteenth century, were found imbedded in the centre Norman piers, supporting Norman circular arches, decorated with zigzags, which must have belonged to the original cathedral of the twelfth century, the date being about 1106. The porch on the south side belongs to the fifteenth century; some of the chapels on the north were built in 1289, and others about 1306; but they were restored or rebuilt in the fifteenth century. The two façades of the transepts are later, the northern being of the fourteenth, and the southern of the fifteenth century. The chapter house, of the thirteenth century, has been restored in the fourteenth and fifteenth centuries. The old Eveché, or Bishop's Palace, now occupied by the tribunals of justice, has some interesting portions of the thirteenth century, one of them being a renaissance chapel, which is now used as a retiring-room for the judges. It is vaulted in stone, and painted. The tapestry of the Queen Matilda, in the adjoining museum, is very interesting; but more as a historical subject than as a work of art. The greater part of the Church of St. Patrie is modern. The tower, however, which is a very fine one, dates from the year 1549; it is composed of seven stories, the four lower being square, and the three upper circular. There are many very interesting wooden houses at Bayeux. The house of the governor is a very remarkable one, in stone of the fifteenth century, the upper part being of the sixteenth or seventeenth century. The Church of St. Loup was originally a structure of the twelfth century, but the tower is the only portion of the building of that date which remains."

[We shall give the remainder of the lecture in our next.]

The CHAIRMAN said he could speak of the great architectural interest attached to almost every place which had been mentioned by Mr. Spiers. He advised tourists who went to Normandy to visit the Champagne country, and to go down to Chartres, where much that was interesting in architecture would be found.

A vote of thanks to Mr. Spiers, which was carried by acclamation, closed the proceedings.

CORN EXCHANGE, ST. NEOT'S.—A meeting of the directors of this building has been held to inspect plans submitted by Mr. Bellamy, of Lincoln. The designs of the architect were much approved of by the directors, and an engagement entered into for carrying out the works. It is much to be regretted that there is a small opposition to an undertaking like this, which promises the accommodation and comfort so long needed by merchants and farmers attending the market. The building will not only be suitable for all purposes, but will also be an architectural ornament to the town. The houses now standing on the site are advertised for sale, to be taken down and cleared away.

THE REREDOS, BEDMINSTER PARISH CHURCH.

OUR Engraving this week represents the Reredos of the Parish Church, Bedminster. It is of Caen stone, and occupies the entire width of the church. The lower stage is a simple arcading, surmounted by a band of quatrefoils. Above are three large panels, surmounted by crocketed canopies, and sculptured with alto-relievo representations of the Nativity, Crucifixion, and Ascension of our Lord. The first of these subjects, which is on the north side, represents the Virgin Mother kneeling in the stable at Bethlehem before her new born Son and Lord, S. Joseph by her side, and three shepherds coming in to pay their homage. Above the stable, which is conventionally treated, are angels, playing on instruments of music; and in the background appear the heads of some cattle.

In the central panel is the Crucifixion. On the north side of the cross stands S. Mary, with the Magdalene weeping on her shoulder; on the south, the "other Mary" and S. John. Above is an angel with crossed stole and uplifted arms, and in the background the city of Jerusalem, and "many bodies of the saints which slept" arising. The sun and moon are also conventionally introduced; and at the foot of the cross appear the usual emblems of mortality, together with a palm branch, indicative of Christ's victory over death.

The south panel represents the Ascension of our Lord, who is surrounded by rays, and attended by angels bearing the crown of glory. Between, and at the side of the panels, are niches containing statues of the four Evangelists, who stand upon pedestals adorned with their appropriate symbols. The jamb columns of the panels and niches are of rouge-royal marble from the Pyrenees, which serves admirably to relieve the statues within. In the spandrels formed by the canopies over the Evangelists are trefoils, in which are sculptured the instruments of the Passion: above those of the Nativity, Crucifixion, and Ascension, occur quatrefoils charged respectively with an Agnus Dei, a floriated cross with interscribed crown of thorns, and a Pelican in her Piety. Over the central canopy is a very elaborate jewel-cut cross; over each of the other four stand winged angels in the act of prayer. The wall behind is carved with a rich diaper pattern.

CORAL LIME.

EXPERIMENTS have been made, says the *Engineer's Journal* for India, by the officers in the Public Works Department, at Barrackpore and Dum-Dum, for the purpose of testing the cost and nature of the lime obtained from the coral of Port Blair. The result has been, on the whole, highly satisfactory; the quality of the lime is pronounced to be good, and the cost, as compared with Sylhet lime, shows a saving of over 100 per cent. In this calculation, however, the cost of shipping from Port Blair has been omitted, as the coral was brought up as ballast. It is reported that the coral makes a fine building mortar, and a fine lime both for plastering and for whitewashing.

One hundred cubic feet of the coral produced about 57 maunds of lime, and the cost per 100 maunds of lime is from Rs. 35 to Rs. 45, exclusive of the cost of the coral; the maund of lime measuring 2.4 cubic feet. The cost of Sylhet lime is from Rs. 85 to Rs. 90 per 100 maunds.

The executive engineer, Barrackpore division, concluded his report on the comparative value of Sylhet and coral lime by observing,—"There does not appear, either from the experiments or from the appearance, any difference between the two kinds of lime; the value seems nearly equal, and the only information obtained is as to the proportions of ingredients which may be made use of; and it appears that proportions of one part of lime to four of soorkie or sand give as good a mortar or plaster as is required. The period of setting in the former mixture does not exceed that of any other mixture; for plaster, the same proportions give a good firm plaster; whitewashing was also done with both kinds of lime, but there is scarcely any difference perceptible between them."

It appears that, not many years since, Sylhet lime cost in Calcutta Rs. 45 per 100 maunds; which is the highest price of the coral lime at the present day, exclusive of freight from Port Blair. The freight, however, must be considered, as the supply, in the form of ballast, would be necessarily limited and wholly unequal to meet any fair demand for the article. The question, then, of importance to builders and to the public is, what should be the freight of coral or coral lime from Port Blair. This should not exceed Rs. 10 per 100 maunds, which would enable the lime to be sold in Calcutta for very little more than the cost of Sylhet lime in former times, and cent. per cent. below the cost of the same article at the present day.

It would be an interesting subject of enquiry to ascertain the cause of an increase to the extent of a 100 per cent. during the last few years in the cost of Sylhet lime. Is this due to increase in wages and transport? or can any of it be traced to the monopoly which ever results from imperfect competition? An average yearly addition of four per cent. in the cost of production would seem to be highly improbable. It is much more likely that a very considerable part of the increase has gone into the pocket of the manufacturer, and that his receipts have been very much in excess of legitimate profit. We therefore look hopefully to the advent of the coral lime. If this can be sold in Calcutta at 25 per cent. above the cost of production, it will be a very great boon to the public as reducing building materials, and, as a necessary consequence, house rent, in a city where house rent is so extravagantly high, as it is in Calcutta.

LONDON SUBURBS.

IF there be one thing more than another upon which the inhabitants of London may pride themselves, it is upon the fact, that they possess, within a dozen miles radius of St. Paul's, some of the most delicious scenery which can refresh the eye or invigorate the mind. Let them escape from the bustle and turmoil of the great city by whatever outlet they may, and they are certain to find, within the circuit referred to, sylvan beauties and rural scenes, which cannot but charm them into forgetfulness of the cares and anxieties of business. Whatever the French "gentlemen of the press" may say, too, about the dreariness of a "Sunday in London," we would ask them whether they can point to any great city on the continent which has in its immediate environs any retreat for the week-day toiler which can match with our Kew Gardens, our Hampton Court, or our Bushy Park,—would that we could say also, our Crystal Palace grounds; but these are as a sealed book on Sunday.

Thus we thought while recently paying a visit to one of the most delightful of the places referred to above, namely, Kew Gardens. It ought to be regarded as an inestimable blessing, that within so easy a distance, and at so small a cost, the working bees of this vast hive of industry may on the day of rest betake themselves to Kew, and revel amid the flowers and the forest trees of that pleasant locale. "All work and no play makes Jack a dull boy," and assuredly, the legislature never did a wiser thing, than when they placed at Jack's, ay, and at Jenny's disposal, at all convenient seasons, gardens, parks, and pleasure grounds. It is agreeable to note that, so far as Kew Gardens are concerned, the march of improvement is still going on. In addition to the thousand and one natural and artificial attractions of that place, a vast Conservatory and Winter Garden is rapidly approaching completion. This edifice, which will be provided with a roof of glass, occupies an extensive area on the right hand side of the grand lawn avenue, between the existing Palm-house and the Pagoda. It is 700 ft. in length, and perhaps 150 ft. in width, and will, when completed, form the largest building for purely horticultural and floricultural purposes in the world. There is at either end of this crystal conservatory a separate circular building, also roofed with glass, and of considerable dimensions. These are intended for the reception of exotics, which require to breathe a warmer and more humid atmosphere than the hardy occupants of the giant building which separates them. The Messrs. Cubitt and Co., of Pimlico are the contractors for this extensive work, and that is saying that it will be well executed.

On a mound, on the opposite side of the avenue to the new Winter Garden, a flag-staff of unrivalled symmetry and height has been set up. It is made of the Douglas pine, and was imported from Vancouver's Island. Mr. Edward Stamp was the donor of this magnificent production of the forest. Its total length is 159 ft., its diameter at the base 22 in., and it tapers to a diameter of 8 in. at the top. Two hundred and fifty rings or layers of wood disclose the fact that the huge spar took 250 years to attain its present dimensions. Its weight is 3 tons, and it contains 157 square feet of timber.

LEGAL INTELLIGENCE.

IN the Bail Court, before Mr. Justice WIGHTMAN, in the matter of an arbitration between John Bulmer and Thomas Nicholson and others.—Mr. T. Jones appeared to show cause against a rule, obtained by Mr. F. Russell during the present term, on behalf of John Bulmer, calling upon Thomas Nicholson and Messrs. Bowman and Raine, his sureties, to pay to Mr. Bulmer various sums of money, amounting to £1,033 18s. 11d., found to be due to him under the award of Mr. Thomas Austin, of Newcastle-upon-Tyne, architect. The matter in dispute arose out of the contract for the building of the new hospital for inmates at Sherburn, in this county, which was entered into some time ago between the governors of the hospital and Mr. Thomas Nicholson, a builder, of Gainford, near Darlington. Subsequently the contract was sublet by Nicholson to Mr. John Bulmer, and disputes having arisen between the parties, it was agreed that the whole matter should be referred to the arbitration of Mr. Austin, the architect employed by the governors for the erection of the hospital buildings. It was the award made by Mr. Austin, under these circumstances, that it was now sought to enforce in the usual way; and on showing cause against the rule obtained for that purpose, Mr. T. Jones endeavoured to prove to the Court that the arbitrator had exceeded the power with which he was invested by the agreement of reference, and has awarded a considerably larger sum to Mr. Bulmer for the work done by him than, upon his (the arbitrator's) own showing, Bulmer was properly entitled to be paid. In support of this view, Mr. Jones read an affidavit, made by Mr. Nicholson's solicitor, but as the main point relied upon therein was contained in a communication from the solicitor of Mr. Bulmer to the solicitor of Mr. Nicholson, which, though written "without prejudice," was unexpectedly and (as it was contended) improperly made use of in opposition to the rule, the learned judge, without calling upon Mr. Russell, ordered the rule to be made absolute, but directed that it should not be enforced until after the last day of term, in order to give Mr. Nicholson and his sureties an opportunity of bringing the amount awarded into court, in accordance with the leave given to them a few days previously by the full court. We understand, however, that the money has not been paid, and that therefore the rule to enforce the award against Messrs. Nicholson, Raine, and Bowman has been made absolute in terms.—*Durham Advertiser.*

THE REREDOS—BEDMINGTON PARISH CHURCH, SOMERSET. Architect, JOHN NOETON, Esq., 24 Old Bond Street, W.

BRICKS AND TILES.

(Concluded from our last.)

BELGIUM, Holland, and the Netherlands, and a large district of central Europe, including Denmark, Brandenburg, part of Poland, and the north of Prussia, are noted for ancient brick buildings. Of this region Brandenburg appears to have been a sort of centre, and here examples of ancient brickwork, extending from the twelfth to the sixteenth centuries, inclusive, can be examined. (See Essenwein, *Norddeutschland's Backstein Bau im Mittelalter*, and Adler, *Mittelalterliche Backstein Bauwerke des Preussischen Staates*.) Marienburg, Danzig, Lubek, and Schwerin, may be mentioned as containing remarkable brick buildings, secular and ecclesiastical. Nearly all the brick buildings of Germany now remaining are Gothic, and some among them are very elaborate, as, for instance, the church of St. Catherine at Brandenburg, of which the richest portion (the chapel of the Holy Sepulchre) was built at the end of the fourteenth century, and executed in variously coloured bricks, enriched with a profusion of intricate tracery, also executed in brick, and hardly surpassed in elaboration by any stone tracery of the same period. The excellence of the Dutch and Flemish bricks and tiles is well known, and they were formerly imported to this country in considerable numbers.

In France (Viollet le Duc, *Dictionnaire d'Architecture*, arts. "Brique," "Carrelage," De Caumont, *Abecedario*) the use of bricks was introduced by the Romans, and under them, and in the Merovingian period, they were frequently employed in conjunction with stone, as already described; but after the ninth century bricks are rarely found in France mixed with other materials; where used they occur alone. In the south of France, however, brickwork with stone dressings is found, as in the church of St. Sernin at Toulouse, built in the twelfth century, and in other churches of that city. In Languedoc, a province where stone was almost entirely deficient, buildings of the thirteenth and fourteenth centuries are found built almost exclusively of brick, but this material was very rarely employed during those centuries in other parts of France. Specimens, however, exist at Toulouse, Alby, Moissac, &c. Bricks enameled of different colours were, moreover, often employed at this period for interior linings to walls, and brick was also made use of with excellent effect in filling in the spaces in timber-framed constructions.

At Moulins, in the Bourbonnais, walls in ornamental brickwork are found which date from the fifteenth century; they are executed in bricks of various colours laid with thick beds of a mortar of extraordinary strength.

In the succeeding century, the sixteenth, brickwork mixed with stone came much into use in France, and from that century to the present day this manner of building has been extensively made use of in that country. In some of the castles of the sixteenth century, for example, the Chateau de Livet (see De Caumont), a species of chequered work, of bricks of several colours alternating with blocks of stone, has been adopted for the walls, and harmonises well with the variegated and enameled tiles for roofs and enameled bricks for floors which by that time had come into use. Parts of the chateaux of Blois and Fontainebleau may be cited as effective examples of the mixture of brick and stonework.

The earliest paving tiles known in France, are those discovered at St. Denis. The pavements there were formed of very small pieces of tiles, measuring not more than $1\frac{1}{2}$ in. square, and closely resembling ancient mosaic. Enameled tiles are found in the paving of some churches in France, dating from as far back as the middle of the eleventh century, but the number of specimens remaining from that and the twelfth century is extremely small. In the thirteenth century the mosaic floorings just referred to were replaced by tiles encrusted with ornaments. Some tiles of this period had a sunk pattern simply impressed upon them, and it seems probable that those first manufactured were of this nature, and that the practice of filling up this impressed pattern with clay of a different colour and glazing the whole was a subsequent step in the manufacture. In the fourteenth and fifteenth centuries tile pavings became very extensively employed, and in some of them comparatively small squares of inlaid and enameled tile are combined to form patterns of large size and of the greatest richness and beauty. Of these the most celebrated is a rich paving in the church of St. Pierre sur Dive. In some instances monumental effigies were formed of encaustic tiles.

In the fifteenth century tiles with patterns in relief were employed in France for paving, and in the sixteenth century enameled and coloured tiles came into general use for roofs; plain tiles having, no doubt, been long employed for the same purpose. These ornamental glazed roofing tiles have continued in use in parts of Germany and France to the present day.

Ornamental finials and crestings in tile and terra-cotta were frequently made use of in connection with these glazed roofing tiles, and were many of them of a highly elaborate character of work.

Turning to our own country, it appears that the Romans introduced the manufacture and use of bricks and tiles into England, and they are constantly met with among the Roman remains. There is, however, reason to believe that, although tiles for roofing and flooring probably continued to be manufactured, few bricks, if any, were produced in England from the Roman time till the end of the thirteenth century; for where bricks occur in buildings erected during that period, they seem to have been always plundered from the ruins of some Roman building, and commonly have pieces of the Roman mortar adhering to them. This is the case at Dover Castle Church; St. Martin's, Canterbury; Darent Church, Kent; Barnack; Colchester Castle, and in other instances. It is related (by Matthew Paris)

that the Saxon abbots of St. Albans, having been obliged, through famine, to sell the store of materials they had collected, for the purpose of rebuilding the Abbey church, the Norman abbot had recourse (A.D. 1077) to the Roman bricks which were to be found in the adjacent city of Verulam, and that with these he built the church. They still exist and are visible in portions of the structure.

"The earliest existing edifice of modern bricks is said to be the Hall at Little Wenham, Suffolk. This is dated about 1260, or 1280. A good description, with illustrations, is given by Turner, *Domestic Arch.*, 8vo. London, p. 151, who seems to think that the earliest brick buildings of this period were the work of Flemings, or at least were built of Flemish bricks. The bond very much resembles what is called Yorkshire, or flying bond. After this period the use of bricks became more and more common, especially in those countries where stone is scarce. Norfolk and Suffolk contain many beautiful examples of mediæval brickwork, as Caistor Castle. In many places, after the Reformation, it seems almost to have superseded the use of stone." (*Dict. of Arch. Pub. Society.*)

Tiles for roofing seem to have been in use in this country at a very early period, so much so that in taking down part of an old Norman building in Southwark, at the time when the approaches to New London Bridge were formed, tiles were found built into the wall which had indubitably been constructed for use as roofing tiles.

The most ancient ornamental flooring tiles found in this country appear to belong to the thirteenth century; and numerous examples dating from the fourteenth and fifteenth centuries are found. Few of the remaining pavements exhibit large and elaborate patterns formed of a combination of small pieces; their usual character being a repetition of a pattern of small size, sometimes contained on the single tile, and at other times formed by the combination of four or six, or eight, or some other small number of tiles.

In the fifteenth century (A.D. 1477) the manufacture of tiles was of importance enough in England to require regulation by a statute (stat. 17 Edw. IV. cap. 4); and tiles dating from the middle of this century (A.D. 1453 to 1456) occur at Great Malvern, where they were employed as a decorative lining to the wall of the chancel round the high altar. In the sixteenth century, the manufacture seems to have declined, and the use of English tiles is said to have been superseded by the importation of Flanders tiles. (*Glossary of Arch.*, art. "Tiles.")

Much excellent and curious brickwork of the seventeenth, and some of the succeeding century exists in various parts of England, the ornamental portions being partly executed in moulded bricks and partly enriched by carving done on the brickwork after it has been built up.

The duty levied upon bricks was first imposed A.D. 1784, at a rate of 2s. per 1,000, and continued in force, but at higher rates, till a recent period.

From the simple nature of the material, fewer instances of unusual varieties and of special modes of manufacture are met with than occur in many other branches of manufacture. Pliny (*Hist. Nat. lib. xxxv. c. 14*) mentions bricks light enough to float in water, and Fabbioni discovered a substance at Castel del Piano, a spot between Tuscany and the Papal dominions, capable of being made into such bricks. Porous bricks, which will float in water, are said to have been employed, on account of their lightness, in the vault of St. Sophia, at Constantinople; and in some of the Roman vaults hollow bricks were used on the same account. Similar bricks, devised and manufactured expressly for the purpose, were employed in turning the great vault over St. George's Hall, Liverpool.

Most of the steps in the history of the introduction of machinery for the manufacture of bricks can be traced in the accompanying series of specifications. Perhaps the most important invention relating to brick-making, the first introduction of which is not there recorded, is that of mixing ashes (technically called soil) with the brick earth, and the employment of coarser ashes in the burning of bricks. The discovery that the refuse of coal fires could be thus utilised has proved of the greatest importance, especially to the brickmakers of the district round London, but when or by whom that discovery was made is now quite unknown.

A comprehensive and very complete account of the manufacture, properties, dimensions, and uses of bricks is to be found in the articles already repeatedly quoted in the Dictionary of the Architectural Publication Society, under the heads of Brick, Brickmaking, &c., and references will be found in those articles to most of the publications from which further information may be gained. In addition to some of the works already mentioned in the foregoing notice, these references include the following works:—Seroux d'Agincourt, *Recueil des fragments en terre cuite*, Paris, 1814; Baskwell, *Observations on Building and Brickmaking*, 12mo. Manchester, 1834; Wedke and Romberg, *Die Baumaterial-Lehre*, 4to. Leipzig; Dobson, *Rudimentary Treatise on the Manufacture of Bricks*, 12mo. London, 1850; Rondélet, *Traité théorique*, 10th edit. 4to. Paris, 1852, and *Supplément*, by Blouet, 1836; Delonge, *Art de Briquetier*; Simons, *Account of Brick-making at Bletchingley Tunnel*, 1840–41, given in *Civil Engineers Journal*, vi.; 348. and Clere, *Essai pratique sur l'art du Briquetier*, 8vo. Paris, 1828.

DISTRICT FIRE BRIGADES.

WE perceive that a movement has recently been made, in the populous district of London, known as Kentish Town, toward the institution of an independent Fire Brigade. The idea is an excellent one, and we look forward with considerable interest to its realisation. The rapid growth and development of the suburban districts of the metropolis

generally, during the last half-dozen years is something marvellous, but we question whether house—nay, street—building has been carried on anywhere during that period to the extent that it has in Kentish and Camden Towns. As if called into existence by the enchanter's wand, whole ranges of buildings there spring into being at once, as it were; and that which was but yesterday a large area of waste ground, is to-day covered by bricks and mortar, and to-morrow will be inhabited by shoals of new colonists. If it be a mystery as to how so many new houses are built in so short a space of time, it seems a still greater mystery as to where the tenants come from who occupy them before they are well finished. However these things may be accounted for, they are facts: and it becomes, therefore, a very pertinent question for the inhabitants of the crowded districts, as to how they are to protect themselves from the evils of fire. It is quite true that the fearful increase in the number of fires in the metropolis, and its outlying districts, during the last year has attracted the notice of the Legislature, and that a committee of the House of Commons have sat and reported upon the matter. Governmental machinery, however, moves but slowly, unless pressure be exerted to expedite its movements, and, to give another reading to an old adage, "While legislators deliberate, fire destroys."

The people of Kentish Town, therefore, are to be commended for taking the law into their own hands in this case, and in organising for themselves arrangements for the speedy extinction of fire. It is a positive fact that at present the whole parish of St. Pancras—in which the principal part of Kentish, and Camden Towns are situated—with its population of 40,000, possesses but one, and that a very old, fire-engine. The nearest station of the London Fire Brigade is in Wells Street, Oxford Street; so that it may be easily conceived to what extent of danger the inhabitants of the districts in question are constantly exposed. It is proposed, we believe, that the station of the new Kentish Town Fire Brigade shall be established in Ferdinand Street, Hampstead Road, that being in the very heart of the unprotected locality. The preliminary steps have been so far taken as to warrant the engagement, provisionally, of a powerful engine of the most improved form, and constructed by Messrs. Shand and Mason of the Blackfriars Road. Arrangements have also been entered into with a Superintendent and a staff of firemen, for the purpose of giving effect to the intentions of the spirited promoters of the plan. Voluntary subscriptions are to afford the means of supporting it.

It may be trusted that other districts will follow the initiative of Kentish Town, because whatever may come of the recommendations of the Fire Committee to which reference has been made, it is certain that only good results can follow a spirited determination on the part of the inhabitants of London and its suburbs to help themselves in suppressing fires.

GAS APPARATUS AT THE INTERNATIONAL EXHIBITION.

(Concluded from our last.)

THE wear and tear of east-iron retorts when used for oil-gas making, forms a large item in the cost of manufacturing this gas. In some countries coals are dear, inferior in quality, producing poor gas, though the price per 1,000 is high. In gas-works so situated, it would probably be advantageous to have a cistern of petroleum oil fixed outside the retort-house. Then a main pipe from the cistern, with branch connections to each of the clay or iron coal-gas retorts, would permit a jet of oil to be sent over the heated coke in each of the retorts towards the latter end of the charge, thereby considerably improving the illuminating power of the gas made. The distillation of Boghead canal coal will probably now be discontinued by the paraffin oil and candle manufacturers, who will find this rock oil the most economical for their purpose. The principal products derived from the distillation are the same as from coal, namely, naphtha, for melting india-rubber and resins; benzole, for dissolving fat and vaporising oil; illuminating oil, convertible into gas; heavy lubricating oils, and naphthaline.

A great improvement can be noticed in the workmanship and compactness of the diminutive gasworks shown, Class X. Nobody who has ever before seen a coal-gas apparatus, could conceive that one could be fixed for a house requiring twenty burners on two ornamental stands, about the size of two drawing-room chairs, exclusive of stowage-room for gas after making, exhibited by the inventor, Mr. G. Bower, St. Neot's. One of these little stands contains a vertical retort, the novelty consisting in lowering a lever attached to a lime luted lid at the bottom of the gas-retort, which permits the used charge of coal, after being changed into coke, to fall out. By raising the lever, the retort is ready for recharging at top. The second stand consists of an annular condenser, the inner ring forming a case for four tiers of sieves for lime purification; the floor acting as a well for sealing the connecting-pipe to the retort. Messrs. Porter and Co., Lincoln, have a stand well worthy of inspection, it contains three gas apparatus, two being constructed in the usual manner, suitable for lighting country factories and farm houses; the third being one adapted for canal coal, invented by Mr. Bower, and called the "National Gas Apparatus." Nothing could be better adapted for noblemen's country mansions, where goodness, but not cost, of the gas is considered. The patent consists in feeding a retort by a hopper, and forcing, with a screw arrangement through the mouth-piece, the used charge of coal into a pan of water at the back end, and below the retort, where it would not be subject to the action of the furnace-fire. At the time of the late Crystal Palace Exhibition in Hyde Park, White's hydrocarbon or water-gas, seemed to be supplanting the old and present mode. Its arrangements were based on scientific principles; the passing the vapour of water over iron cuttings, which absorbed

the oxygen of the water and set the hydrogen free for forming carburetted hydrogen when passed over heated coke in a sealed vessel. So far as Great Britain is concerned, this patent is a dead letter.* Two wheels support a furnace, the fire of which plays on a vertical gas retort, the open lower end of which terminates and is sealed in a water-cistern; consequently, half the retort is carbonising coal, the other half creating steam. There is a large waste of furnace fuel, the heated gaseous vapour of the water passes through the whole of the red-hot coke, eaking towards the end of the retort, thus producing carbonic acid and light carburetted hydrogen gas. The exhibitor, Mr. L. Edmonson, should discontinue at once such a faulty arrangement. If he likes to have a furnace on wheels, let him cast the vertical retort with the floor closed, and place the outlet at the lower part of the side at back, sealing the lid when removed with lime luting in the usual way. The great object in all gas-works is to use coal perfectly dry. To patent a method that keeps coals damp when employed in making gas seems a little remarkable.

Class X., also, has some bituminised pipes for gas and water purposes—size, from 2 ft. 6 in. bore, and under; lengths, from 9 ft. to 6 ft. Time alone will prove whether such description of pipes will retain water under pressure, or bear the chemical action of gas. There are some large-sized east-iron pipes, by Mr. D. Y. Stewart and Mr. Edington, Glasgow, manufacturers. Messrs. Cochrane, Dudley, in Class I., also exhibit a very large east-iron pipe. Returning to the Civil Engineering department, Mr. George Glover shows his patent standard gasometer, fitted with "Negretti's" patent gas thermometer. The improvement effected by Mr. Glover is considerably in advance of the mode devised by Professor Airy, who forced the measured gas out of the cubic foot holder, whereby a portion of the gas became disseminated in the water of the tank—the difference being the raising a tank full of water for the purpose merely of displacing in the holder the issuing gas passing into the meter to be tested. The Gothic gas chandeliers shown by Messrs. Harts, London, and R. W. Winfield, Birmingham, are worthy of inspection, Mr. Messenger having some of a mediæval character, designed by Mr. Digby Wyatt. The stand of Messrs. Mapplebeck and Lowe contains gaseliers having many varieties of lacquer. Lambert Brothers, Walsall, show a gas valve, which indicates on a plate the degree it may be partially or fully open, or wholly closed. Mr. R. H. Hughes' safety whistling chandelier is to be seen in Class XXXI. The action is simple: when, through the evaporation of a warm room, the water in the outer pipe of the telescope has become too little, gas passes under the end of the middle pipe, which, on escaping at the top of the outer pipe, blows a whistle fixed there. In a similar manner might be placed whistles to lower curbs of gasholders in gas works, which would announce their being full. Mr. Clarke shows his patent gas regulator, which, like those introduced by Mr. Hart and Mr. Paddon, will save people the trouble of having to adjust their gas burner taps, of an evening. Mr. Laidlaw's stall contains Allen's patent protecting and compensating gas meter.

At the last Exhibition there was shown an unpatented meter by Mr. R. C. Mead, which contained the principle of replenishing from a reservoir by the rotary action of the wheel the water absorbed by the dry gas from the drum. Since then, probably twenty patents have been obtained for doing the same thing by a slight alteration of manner.

On account of the porous nature of fire-clay gas retorts, in large gas-works it has been found necessary to force the gas, after being generated through the pipes and layers of purifying materials, to prevent back pressure on retorts: This is done by a peculiarly fitted steam-engine called an "exhauster." Singularly enough, no such kind of machinery can be noticed in the building; though from the circumstance of very little power being necessary, the smallest engine suffices. The refuse ashes from other furnaces in gas-works would keep exhausters in action. The attention required when in use is inconsiderable, almost nominal. Exhausters prevent a considerable loss of gas; it is probable before long, in works where over five millions of gas is manufactured annually, they will be generally introduced. On two pedestals at the steps under eastern dome are two beautiful mediæval gas standards fully 6 ft. high, made for the Lichfield Cathedral, by Mr. Skidmore; the deep tone they are painted, partly blue, purple, brown and green, harmonises well, infinitely superior to the paltry, tawdry, glittering, yellow lacquer. Mr. D. Dawson, Class I, shows a bottle of coal tar and its products, crude naphtha, benzole, aniline, and the beautiful Magenta dye. A few years since the carbon encrustation of retorts formed part of the refuse of gas; it is now bought by manufacturers for mixing with fire-clay, to make crucibles for melting copper, which goes by the name of the improved carbon crucible; Mr. Hall and others exhibit them. Some consider this kind equal, if not superior, to the patent plumbago crucible.

A Mr. Warner advertises his patent anhydrous oxide of iron by means of a placard hung up in Class I. This placard bears a highly coloured print of a gas works, bought evidently at a shop in the "Strand," in whose windows such has appeared for sale for the use of schools during the last twenty years. For a long period the economy of using the various oxides of iron and other metals for gas purification, has been generally appreciated, on account of their revivifying after repeated use, when exposed to atmospheric influence. Mr. Cockey shows his patent centre valve, which bears a striking resemblance to those used by Mr. Malam, thirty years since. There is also a patent-safety mode for drilling and tapping gas main-pipes to connect services; the tap follows the drill, forming part of same piece of steel. The escape of gas is prevented by the neck of the drill-tap being encircled by a pad. The Wood Street explosion caused this ap-

* Wigram's Patent. Class 10.

paratus to be invented. Samples of the red-painted tin canisters which disfigure many of the public lamps, are, it appears, now at the Exhibition. If the fluid, probably petroleum oil, used by the Carburetting Company, confers, when vaporised in coal gas, such an increase of illuminating power, surely the combination should take place at the gas works in the manner suggested already. To carry out the principle in its integrity, the gas burner should be removed, and the fluid burned in Holliday's lamp. When coal gas is burned perfectly, all its illuminating power is produced without any such aids.

Mr. Prosser's patent oxy-hydrogen lime lamp may be seen, being the particular one which was used during three months at the South Foreland lighthouse. It is stated that the lamp then burned for sixteen hours, without requiring any attention. About two years since, the lime light for some time was used at Westminster Bridge. This light is produced by the joint combustion of hydrogen and oxygen gases, in very minute quantities, upon a wick of lime. The great cost of manufacturing oxygen, together with this mode requiring two lines of pipe for each lamp, caused its use to be discontinued.

The late George Stephenson was the first who suggested that the coal formations absorbed from the sun, in past ages, the illuminating power which now lights our streets at night. This idea is still promulgated by writers and lecturers. To substantiate this notion, some matter should now be re-absorbing the light given forth daily, not only by the sun, but by fires and other artificial means continually in use for producing light. There is one agent, oxygen, which decomposes minerals, rocks, &c., continuing afterwards in the form of oxides, &c., to be absorbed for a time by the substances subdued. The continuous action of oxygen has been going on since every alteration in the earth's surface can be conceived. Assuredly oxygen, which reduces everything, the action of which causes all light, requires, when absorbed by its affinity to other substances, to be restored. May not, therefore, the sun's rays be a producer of oxygen in the upper atmosphere?

GEORGE WALCOTT, C.E.

THE REV. GEORGE WILLIAMS, B.D., ON ECCLESIASTICAL ARCHITECTURE IN GEORGIA AND ARMENIA.

THE CONVENT AND CHURCHES OF SAFFARA.

I MUST now beg you to accompany me up the lovely valley of Borjom, into the wild volcanic district of Abkhazie, where in a narrow gorge which opens on the left bank of the river Ourawelha, an affluent of the Kuv, are found the extensive and picturesque ruins of the Convent of Saffara, built on an artificial platform, partly levelled in the rocky hollow of the valley, partly formed of solid masonry. Its eastern and western boundary walls are drawn right across the rugged valley; the northern and southern walls run along its steep sides, following the irregularities of the ground, having a circumference of more than half a mile. At the north-west angle of the enclosure is a castle, situated on the wall itself at its highest part, and commanding the whole position.

The monastery was dedicated to the Blessed Virgin; but its principal church with which I shall commence my description, as I did my survey, is named after S. Saba, a saint of Palestine of the fifth century, whose celebrated monastery in the wildest part of the wilderness of Judea is known to all who have travelled in that country; and this dedication of a Georgian church to a comparatively obscure local saint of Syria, is an interesting national memorial of a well-attested historical fact, that the Georgian Christians of the Middle Ages were among the most numerous and devout pilgrims to the Holy Land, where they were treated with greater consideration by the Moslems than any other pilgrims.

The exterior plan of St. Saba's Church is a parallelogram. Its interior cruciform, similar in this as in other respects to the church of Timotheusméné, which I have before described as a type of the larger churches of Georgia. The nave of a single bay; the peculiar aisles; the transepts extending the whole width of the building; the deep apsidal sanctuary (semicircular within, flat square without), flanked by chapels, so to speak, with similar terminations; and the polygonal lantern at the intersection of the roofs, are features common to the two buildings, as is also the massive stone roofs with the bold overhanging coping. The general dimensions are nearly the same, the Church of St. Saba having slightly the advantage in size.

The construction of the arches is of the rudest type of Romanesque, utterly devoid of mouldings or ornaments of any kind. A short shaft resting on the crown of the principal arch supports two smaller arches, lighting a triforium gallery over the diminutive aisles, which open also by narrow round-headed arches into the transepts.

The church, sufficiently lighted by the elegant lantern (circular within, but polygonal without), has windows only in the centre of the apse, and the extremities of the transepts, small single lights of Romanesque, very much played.

Of the side chapels of the sanctuary, that on the north communicates with the sanctuary as well as with the transept, the south with the transept only, as at Timotheusméné. The apses of both are pierced with narrow round-headed lights much played. In the apse of the north chapel still stands a very remarkable altar, consisting of a round shaft with a cushion capital, the abacus of which serves as the holy table, being not much more than a foot square. In front of this is another modern altar, which is still occasionally used.

Immediately within the entrance of the south chapel, on the right, a hole in the floor suggested the idea of crypts, which the situation of the church seemed fully to warrant, and the native's account of large vaults extending under the whole church—filled with human bones—to which this was the entrance, excited my curiosity, which was far from satisfied, when having, after infinite trouble, effected an entrance by means of a rickety ladder, without rounds, I found that the crypt extended only under this small chapel. However, I had done my duty as an ecclesiologist, and risked my neck into the bargain.

I shall have done with the interior of the church when I have further mentioned that the walls appear to have been covered with frescoes. The most intelligible of what remains is also probably the most interesting. It is on the wall of the south transept. The picture represents two Georgian princes—

atabeles—in rich national costume, still in use, presenting a model of the Church to our Saviour through the intercession of the saint to whom it is dedicated. The figures are larger than life, the treatment no doubt conventional, but very effective. As to the identity of the saint there is no question, since his name is written in the character called 'khoutzouri,' near his head; and the name and title of one of the chiefs has been deciphered: "Beka, spassalar, generalissimo of Samtzhkhé." The fragments of a longer inscription were read, and are translated in M. Brosset's 2nd Report to Prince Verantzoff.

The inscription obviously amounted to an invocation of blessings temporal and spiritual on the restorer of the church, in consideration of his services to the house of the Lord: and this benefactor was Sargis, commander-in-chief of the Samtzhkhé, son of Beka, chief of the mandators—whatever that may mean. These notices will be of service when we come to the history of the church, which we must now leave by the west door, in order to examine the porch, when we have just noticed, by the way, that there is also a north door giving entrance into the north aisle, richly ornamented without, and having in the tympanum a foliated Greek cross, with the brief inscription, "Christ, the Word of Life."

The porch is 26 ft. long by 9 ft. 6½ deep, with north and south doors, supported by three round arches, resting on round shafts. The beauty and finish of its exquisite arabesque chiseling forms a remarkable contrast to the rudeness of the interior work, to which I have already adverted, and would seem to indicate a later period, and a further advanced stage of architectural science. And yet, on the other hand, the exterior ornamentation of the doors and windows of the church, which is almost equally rich—specimens of which I am able to exhibit to you—and which seem to be coeval with the building, prevent me from positively adopting this hypothesis, especially as the inscriptions on the porch itself apparently belong to the same period as the princes whose names are recorded in the interior. One of these inscriptions runs partly round the window of the porch, and is as follows: "This temple was finished, after the foundation . . . by the hand of Pharelas-Dzē (or the son of Pharela), God assoile him." Without the circle, in characters not carved, but only painted, is apparently the date: but impressed in a manner utterly unusual in Georgia. The numerical value of the characters is 500 + 100 + 9 + 1 = 610: but as the era is left absolutely undetermined, the date must be purely conjectural. M. Brosset suggests that the copyist—the universal scapegoat in all such cases—has inserted the 100 by mistake, and that the date should be 509 [510] (of the Pascal cycle to wit), which would correspond with 1289 A.D. [the cycle only numbers as far as 532]; from which he concludes that the date ought to be read 529, = 1309 A.D. Such a deduction from a baseless hypothesis does not satisfy us; but I have nothing more plausible to suggest, unless we are at liberty to suppose that the Mohammedan era was in use in Georgia—as in other parts of the Christian east—which would give us a date corresponding with A.D. 1213.

On the carved stone which forms the lintel—or rather the tympanum—of the west door of the church, are two very remarkable inscriptions. I translate them as curious memorials of the Georgian Christianity of the Middle Ages:—"In the name of God, I Okra, son of Gabatzia, have offered 100 botnats . . . to establish for ever an aghape for the first Lord's Day of the Pascal full moon. Whosoever shall alter this institution is anathematised by the mouth of God."

The botnat was a coin of the Eastern Empire, which derived its name from the Emperor Nicephorus Botoniates, who reigned from A.D. 1078–1081. The other, beneath the preceding, is still more curious:—

"In the name of God, with the assistance of the most holy mother of God, and S. Saba, I John, spiritually blessed, the son of Ghaw, of my own free will, being in full possession of my faculties, have offered to S. Saba my estate of Tzikhis-Djouan, without reserve, with the fortress, the church, the waters, the woods, the forests, the royal demesnes, the corn-lands, the vineyards, in one word, all. No one has any claim on them, my father himself had offered them . . . except my portion. The principal of the monastery, who partakes in this benefaction, will not refuse me religious priests (to celebrate). Whoever shall take away from S. Saba my estate, he shall make satisfaction for my sins. May his soul . . . in his unfaithfulness to S. Saba. All this that is written is enough, and more than enough. The *lata* shall celebrate for ever the agape written on the door. Whosoever shall alter this is anathematised by the mouth of God."

Beneath this, again, in large, deep cut characters, is the dedication of the door itself: "Lord God, receive this door as Thou didst receive the obol of the widow. God have mercy on the pilgrim, George Malé. Amen."

At the side of the great charter is this: "Lord, have mercy on Tarkha Tbéli. I have offered to S. Saba of Tzikhis-Djouan my estate . . ." Unfortunately none of these names are known to history, so that they determine nothing as to the date of the church.

I proceed now to the other buildings. Adjoining the porch on the south side, and so covering the west front of the south aisle is a small Lady-chapel (of our Lady), said to have been built before any of the others. It has no exterior inscription, but within, in fresco, are the portraits of Sargis and his two sons Beha and Chalwa. This is important, as fixing approximately the date of the building: for Sargis of Djag is the prince who first established the independence of the atabees, under King David V. He died in A.D. 1285, and was succeeded by his son Beha I., whose son, Sargis II., we have already seen depicted on the wall of the south transept.

Attached to S. Mary's and abutting on the south wall of the great church, extending as far as the transept, is the chapel of S. Marina, not more recent than the others. It is distinguished by a narthex, which covers its west front, and has a separate lean-to roof. The arabesques at the east end of this chapel are remarkably rich, and many loose stones lying on the ground are exquisitely chiseled. On the north wall is the following inscription: "Lord supreme, Divine Christ, who exalteth those who glorify Thee, exalt in both worlds our Lord Beka, chief of the mandators, and his sons: who has deigned to grant a place of sepulture to us, unworthy to be his dust; to Laswir, son of Laswir, and his brothers." Under this inscription are full-length portraits of the three brothers, Swibat on the left, Laswir on the right, entitled, chief of the *msakhours*; between the two Nicolas in a monastic habit; to whom, probably on this account, the place of honour is assigned. Opposite to these under a window are the figures of S. George, S. Demetrius, and S. Theodore.

This, then, was a mortuary chapel of these three brothers; and the state of the ground in the middle of the building seems to indicate that there was formerly a sepulchral vault beneath the pavement. Beyond, i.e. south of this church of S. Marina, is the small chapel of S. George, on the front of which M. Brosset saw a rude carving of S. George and the Dragon, which is now lying among the rubbish of S. Marina's Church.

This chapel is very diminutive, being only 13 ft. 4 in. long, by 8 ft. 2 in. wide. But it has a north-side-chapel, 10 ft. 6 in., by 5 ft. wide. This tiny chapel has an altar in situ, similar to that in the north chapel of the cathedral, i.e. a square abacus, resting on a cushion capital, supported on a round shaft, entirely of a Norman type. The dimensions of this altar are 3 ft. 2½ in. high, the table being 1 ft. 9½ in. long, 1 ft. 3½ in. wide. I thought it was a curiosity of diminitiveness, which led me to take the measures. In the east apsidal window of this chapel was a small stone model of the Church of the Resurrection at Jerusalem, another record of the spirit of pilgrimage. This stone bore an invocation of spiritual blessings on the deacon Gabriel-Bagrat.

This Church of S. George was erected by one of the superiors of the monastery, as an inscription on its west front attests. "In the name of God, I, Grigol Naphchounis-Dze, Superior of the holy brothers who dwell here at Saphara, have built this small chapel in memory of my sinful soul, to the end that the Lord may, through the intercession of S. Saba, the illuminator of monasteries, draw me from the midst of those on His left hand, and count me among those on his right hand. The Lord have mercy on Grigol, the builder of this."

I have further to notice a very small mortuary chapel, at the north-east of the church of S. Saba, said to have been the depository of the abbots. It has three rows of vaults, now exposed, and filled with skulls and human bones.

To the west of the large church is the belfry, consisting of a polygonal lantern, to which there is an ascent from the exterior, while the ground floor is occupied by a small chapel, dedicated to S. John Baptist, over the door of which, on either side of a Greek cross, is this brief inscription. "S. John Baptist, have mercy on Joseph of Djag and his sons. Amen." The tomb in the chapel is doubtless, that of Joseph, otherwise unknown to fame; but the fortress of Djag is known as the cradle and nursery of the race of the Georgian atabegs, on the right bank of the Troblanha (or Djagis-Tsqual) to the north-west of Akhaltsich.

The last chapel I have to name, is that of S. Simon (Peter), close to the northern entrance; very small, and remarkable for nothing but the exquisite beauty and solidity of the masonry, which, indeed, it shares with all the other sacred edifices. The Prince Tomanoff informed me that this stone must have been quarried very many miles—I think he said as much as sixty miles—from this spot, as there is none to be found nearer. It is a fine, compact lime-stone, with a rich pink or rosy hue, which imparts a glow of warmth to the whole of the buildings.

The castle, which crowns the steep at the north-west of the church, and forms an imposing object, presents nothing worthy of special remark; and I believe I may bring my over-long description to a close, when I have mentioned that absolutely nothing remains of the domestic buildings of the monks, except fragments of walls and foundations, among which I liked to fancy I could identify the refectory not far from the small chapel of S. Peter.

TSOUNDA.—We must now ascend the River Kur some twenty miles, passing the romantic village of Khertwis, with the fine ruins of its once magnificent castle, situated on a bold, rocky promontory, formed by the confluence of the Tapravanie and the Kur, until we arrive at the extensive ruins of Tsounda in the midst of a district full of interest for a geologist. The village is situated on the right bank of the Kur, which here makes a considerable bend to the south. But we are, at present, only concerned with the church, which stands at the outskirts of the modern village, entirely abandoned to decay, though still capable of complete restoration at a moderate outlay. It is of the same type as that of Daba, already described as the model of village churches; but it has some features peculiar to itself, which I proceed to describe. It is based on an artificial foundation formed of three or four courses of very large stones, rising to a height of ten or twelve feet, and is thus completely isolated, nor are there any indications of the steps by which the ascent must formerly have been effected. The Romanesque doorway in the west front is stopped with solid masonry, laid in regular courses, and in the centre is a cross richly carved, with bunches of grapes suspended from the arms. Over the door is a single window, and one on each side, similar to those of Daba, with arabesque bands equally rich. This door is in the wall immediately overhanging the precipice. On the south side the church appears to have been based on the natural rock, which rises abruptly from a small plain. Here, in later times, a porch has been constructed, of irregular form, giving entrance into the church under a flat dome, very richly carved, but now much decayed. The door is flanked with shafts of very peculiar character, baluster shafts they may be called, but they more resemble the bed-posts of the Jacobean period, than any known order of classical or Gothic art. The church is about 30 ft. long by 20 ft. wide, divided into two bays by flat pilasters, with an apsidal termination; the outer wall being, as usual, rectangular. But the most notable feature of this church, is a small court on its south side, surrounded with a wall some eight feet high, which is pierced with loopholes, and was evidently not only intended but actually used for a bastion, as the marks of balls and bullets are still to be seen on the outer face of the masonry; another of the numerous tokens that exist throughout this country of the hard, and sometimes desperate struggles, by which these chivalrous Christians maintained their faith for many centuries against the vastly superior forces of their Mohammedan invaders from the south. The church, unfortunately, is not dated; but from its masonry and ornamentation, I should be disposed to assign it about the same date as the church of Daba, i.e. the first half of the fourteenth century. It is now called S. George's Church, but an inscription on the tympanum of the western doorway, informs us that it was dedicated to S. John Baptist, by Itchkihi son of Gourgien, a name unhappily not known to history.

(To be concluded in our next.)

ARCHITECTURAL PUBLICATION SOCIETY.

THE annual general meeting of this Society was held at the rooms of the Institute of British Architects, on Monday evening, when there was a numerous attendance. Amongst the gentlemen present, we noticed Professor Donaldson, Messrs. Arthur Ashpitel, C. C. Nelson, James P. St. Aubyn, Benjamin Ferrey, J. W. Papworth, Edward J. Anson, Harry R. Newton, Octavius Hansard, T. J. Willson, George R. Burnell, Joseph Jennings, Charles F. Hayward, J. P. Seddon, James Thomson, Horace Jones, C. J. Ferguson, Charles R. Bedells, &c. Mr. ARTHUR ASHPITEL was unanimously called to the chair.

Mr. CATES then read the report for the year, which stated, that in their last Report the

Committee alluded to the delay which might possibly arise in producing the text intended to be issued for the previous year (1860); their anticipations have not been unfounded; they have, as yet, only been able to prepare one part, completing the letter F; but the second part is in a forward state, and will be issued at the earliest possible period. The preparation of the manuscript is undertaken by gentlemen much engaged in professional duties; and the Committee, therefore, refrain from more than urging on them an early attention to the claims of the Society. The careful revision by others, and the requisite searches and references to authorities, occasion, not unfrequently, a stoppage of the whole work in its printing, sometimes extending for weeks together, while some important question is being investigated. There is no doubt, that by neglecting the precautions thus taken to secure accuracy, a quicker issue might be obtained; but the Committee hesitate to alter the present arrangements, lest the work might be rendered of less authority and be less esteemed. The flattering notices with which the last part has been received, show that, although so long delayed, the execution is not inferior to previous parts, nor has the high claim of the work to general support been in any way diminished. The illustrations to be issued for 1861 have, for a long time, been prepared; and would have been issued prior to this meeting, had not the claims of important matters, connected with the International Exhibition, diverted the attention of one of the lithographers from his engagements with the Society, thus delaying the completion of the part: nearly all the plates are now printed, and, therefore, the part will soon be ready for distribution. It will contain the following plates: Farm-Buildings; Fountain; Groined Roof (2); Half-Timber House; Lych Gate; Metal Work (2); Mosque; Pavements, coloured (2); Pavements, in outline (2); Porch. The subjects comprised in these fourteen plates have been selected from the portfolios of Messrs. Bowman, R. S. Burn, F. P. Cockerell, J. T. Christopher, G. Goldie, O. Hansard, R. J. Johnson, T. S. Pope, J. P. Seddon, G. Truefitt, and J. W. Walton, who have kindly placed their valuable collections at the disposal of the Committee. To all these gentlemen the thanks of the Society are due, but more especially to Mr. Henry Bowman, of Manchester, for the liberal manner in which he has permitted a selection to be made from his important and unrivalled series of measured drawings of the marble pavements of St. Mark's, at Venice; from this valuable source the Committee have secured materials for the two coloured plates, and have themselves to express their obligations to Mr. Bowman for his kindness in materially assisting them, not only in the arrangement and reduction of the examples for, but also in superintending the execution of, the plates, so as to secure the proper colours in printing. These subjects, from their well-known value, have appeared to the Committee sufficiently important to warrant them in expending a larger amount than usual, by adding to the twelve plates ordinarily issued, two coloured impressions of these designs, showing at a glance the key to their formation; and thus being likely to prove serviceable to the designers of similar works. To the last part issued there was prefixed a list of terms proposed for insertion in the next part of letter press, and contributions and suggestions were invited from their friends who might have notes on the various subjects. The Committee hope that the subscribers will evince their interest in the work by communicating any information they may possess, and the labours of the writers will be thus materially assisted, and the "Dictionary," at the same time, usefully increased. A suggestion which lately appeared in one of the Architectural Journals, that the back stock should be sold at a reduced price to provide funds for the completion of the undertaking, has afforded the Committee an opportunity of publicly renewing their pledge, that no portion of the works of the Society shall be sold under the subscription price (hear, hear), and the continued accession of new subscribers convinces the Committee that the course they have taken is approved, and that it is the only one by which the Society could be maintained in a sound and satisfactory condition. The arrangements which were commenced in 1860, and by which new subscribers were permitted to spread their subscriptions for past years over a considerable period, continues to receive general approval, and it is with much gratification that the announcement is made of forty-two members having availed themselves of this arrangement. If anything were required to show more decidedly the character which the work has obtained, the Committee could refer with much satisfaction to the manner in which it was taken up by his late Royal Highness the Prince Consort, who, when the work was submitted for his inspection, was graciously pleased to bestow on it a careful scrutiny, which resulted in the order for the supply of the book to three of the Royal Libraries. Among recent accessions to the list of subscribers may be mentioned his Grace the Duke of Buccleuch; Sir Watkin W. Wynne; Mr. Henry Thomas Hope; the Corporation of the City of London, for the Guildhall Library; the Council of Patents, &c. The balance sheets appended to this Report showed the receipt and expenditure on the several accounts; and that the balance applicable for completing the issue for 1860 is £277 18s. 8d., and for 1861, £279 15s. 6d.; the total balance in hand being £293 8s. 6d.

After a careful review of the position of their work, and of other similar undertakings, the Committee are fully convinced that, notwithstanding the delays, they are comparatively but little in arrear; and whilst they fully sympathise with their fellow subscribers, in the anxiety that all must feel to reach the termination of their labour, they entertain a deep conviction that it is their duty, as well as the true interest of the Society, to study far more anxiously how to sustain the excellence of the work, than how to hasten it towards an unsatisfactory conclusion.

The CHAIRMAN moved the adoption of the Report, and Mr. GEORGE R. BURNELL seconded the motion, which was carried, and after a lengthened conversation the report was unanimously adopted.

Votes of thanks were passed with acclamation to the Committee, the honorary treasurer, the honorary secretary, and the Chairman.

PROPOSED RESTORATION OF ST. MARY'S CHURCH, GUILDFORD.

IT is proposed to restore the ancient Gothic church of the Blessed Virgin Mary, in Guildford, one of the finest and most interesting ecclesiastical structures in Surrey, and the Archaeological Society of the county has been officially asked, through the local secretary, to authorise the proposed restoration, and to give its advice on the matter. A special meeting of the Society was accordingly convened, to consider the application, which was fully and carefully discussed. The result was that the honorary secretary of the Society, Mr. Sass, has written to the applicants, stating that the council of the Society had the pleasure of acknowledging the compliment offered to them, in the solicitation of their advice on the contemplated repairs of the church; and that at a meeting especially convened, the council, after much consideration, had come to the conclusion, that greatly as they value the preservation of ancient buildings, the rules of the Society place it out of their power to take active steps tending to interfere with any existing ancient fabric, especially that of St. Mary's Church, a building possessing in its present condition so very many interesting features. The only suggestion the council felt it at present possible to offer was, that in any works that may be resolved upon, the utmost care should be taken to avoid the not infrequent result of modern restoration, namely, the destruction of the original characteristics of the ancient pile. This church, which is 100 ft. long, and 62 ft. wide, and has three apsidal ends, was built on the solid rock, in the reign of Stephen. We have been informed that the proposed restoration is to be entrusted to Mr. Lower, architect. The estimated expense of alterations and repairs in the nave of the church, including reseating and reflooring the interior, rebuilding the whole of the south wall, restoring the whole of the windows of the north and south aisles, and recovering the roof, is £1,520; while the restoration of the whole of the eastern portion of the church, or the three apses, which is also contemplated, will involve a further outlay of £1,000. We trust that the utmost care will be exercised in the restoration, and that no niggardly disposition will be exhibited in the provision of ample funds, so that a becoming restoration may be effected, and everything like the destruction of a fine architectural monument entirely avoided.

CHURCH, CHAPEL, SCHOOL, AND OTHER BUILDINGS.

GREY FRIARS' CHURCH, READING.—The work of restoring this old building is progressing rapidly. Now that the Bridewell walls have been removed, it is discovered that a large portion of the stone work is in a good state of preservation; and all the old works that can be safely left will not be moved. The arches and pillars, with one or two exceptions, are complete, and in excellent condition; and while we may have regretted that the building had been so long converted to such a sacrilegious use as that of a borough Bridewell, there is no doubt that that use has been the means of largely protecting it from decay. The flint work on some of the outer walls is also in a good state, and will only require "pointing;" and there is also much of the external stone work perfect. The visitor can now obtain some notion of the noble proportions and former beauty of the church, and, from the way in which the work has been so far carried out, we have every confidence that the building will be faithfully restored. We are glad to learn that the Rev. W. W. Phelps, through his architects, Messrs. Poulton and Woodman, has succeeded in purchasing a piece of land from Mr. F. M. Slocombe, on the north side of the church, for the purpose of building a transept, to correspond with one on the other side. Portions of the old floor have been found; and it appears to have consisted of small red tiles, coated with a yellow enamel. Contracts have been entered into with Messrs. Wheeler for the stone work, amounting to £1,885, and Mr. Shepherd, for laying on the roof, carpenters' and tilers' work, for £899, the work in both cases to be completed at Christmas next. The contract for the internal fittings has not yet been settled.

FROME CHURCH.—PROPOSED RESTORATION.—The fine old parish church of Frome is now in course of restoration. It is a good specimen of the old parish churches of England, of which Somersetshire boasts not a few. The first church was built and endowed by Althelm, Bishop of Sherborne, in the time of Ina, King of Wessex, A.D. 785. The first incumbent of whom we hear was Reinbaldus, who had the good fortune to be Chancellor to King Edward the Confessor, and who was no less a favourite with William the Conqueror. Reinbald is mentioned in the "Domesday Book," as priest of Frome. Henry I., into whose possession all the lands of Reinbald fell, and among them those of Frome, passed them over to the foundation and endowment of the Abbey Church of Cirencester; and from that time, the abbots of that monastery supplied a vicar to Frome. In after ages the lands passed (in the reign of James I.) into the hands of the family of Thynne, who have ever since enjoyed the patronage, advowson, and right of nomination to the vicarage. In later times this church has become famous as the burial-place of one of the best and most faithful confessors of the English Church—we allude to Thomas Ken, Bishop of Bath and Wells. "He had desired that, wherever he might die, he might be buried in the churchyard of the nearest parish within his diocese, and be carried to the grave by the six poorest men in the parish." And this wish was fulfilled. He lies under the window of the chancel. A brass tablet has been placed in the chantry chapel adjoining, together with the gift of a painted glass window, recording the life of Ken. This touching inscription appears upon it—"Imprisoned by one king, deprived by another." The church has, of late, been pronounced unsafe, from mere old age and decay of time, and now contributions are solicited for its restoration. The chancel was restored, some fifteen years ago, by a committee, over which Mr. Markland, of Bath, presided. Those who reverence the memory of such a confessor as Ken, as well as those who sing his hymns—and in what church are they not sung?—will, we hope, contribute to this good work. A man who stood so distinctly before the Church, as a representative of the faith, opposed in one extreme to James II., and equally, on the other, to William III., and yet suffering at the hands of both, merits not a little at our hands. The parishioners, in public vestry assembled, have confided the work of restoration entirely to the hands of their present vicar (the Rev. W. J. F. Bennet). They, with others, have contributed already £2,500, but it is feared that at least another £2,000 will yet be required.

CHAPEL AT NEW KNUTTON.—The denomination of Christians known as the United Methodist Free Church having determined to erect a place of worship at New Knutton, near Newcastle (Staffordshire), recently purchased a site for that purpose in a convenient part of that rapidly increasing village. Mr. Tonge, of Newcastle, has contracted to erect the edifice for £170. The dimensions of the building will be 30 ft. by 25 ft., and about 150 sittings will be provided. The corner-stone was laid on Monday afternoon by Mrs. W. Lawton, of Silverdale, and the ceremony appeared to create much interest, a large number of persons being present to witness it. After devotional exercises, the stone (under which was placed a bottle, containing a copy of the connexional principles, a copy of the circuit regulations, the names of trustees, and the name of the person laying the stone) was lowered and adjusted. Mrs. Lawton then declared the corner-stone to be laid.

BAPTIST CHAPEL, WILLENHALL.—The foundation stone of a new Baptist chapel in Upper Lichfield Street, was laid on Monday by the Right Hon. Lord Teynham. The chapel, which has been designed by Mr. C. Manton, of Wolverhampton, will contain 556 sittings, and the schools at the back may at any future time be added, which would increase the sittings by 250. The total cost will be £1,600, and it is expected that the building, which is being erected by Mr. D. Evans, builder, of Wolverhampton, will be completed by Christmas. Lord Teynham laid the memorial stone. It was placed in the front of the building, and bore the following inscription:—"This stone was laid by the Right Hon. Lord Teynham, on the 19th day of May, 1862." Beneath it was placed a glass bottle, containing several documents.

WESLEYAN CHAPEL, WALSALL WOOD.—On Monday the first stone of a new Wesleyan chapel was laid at Walsall Wood, by Mrs. B. Bloomer, of the Grove, Pelsall. A silver trowel and a mahogany mallet had been provided by a number of ladies, and were presented to Mrs. Bloomer by Mr. John Brower. After the stone was laid, the Rev. William Naylor, the chairman of the Birmingham district, and the oldest minister in the Methodist church, delivered a most impressive address, and gave a most comprehensive summary of the Methodist doctrine. The design of the chapel is of the early English style of architecture, and it will cost about £100, nearly £300 of which has been promised.

TOUCHEN END CHURCH, BRAY.—On Friday last, the church of Touchen End, Bray, was consecrated with the usual solemnities. This is the third additional place of worship erected in this extensive parish, within the last seven years. Touchen End, a hamlet on the White Waltham border, is more than two miles from the parish church; the greater portion of its population, therefore, could not, without much inconvenience, avail themselves of its services. To remedy this evil, the new Church of Holy Trinity has been erected, chiefly through the exertions of the vicar, the Rev. J. E. Austen Leigh, aided by the munificence of one who still continues to take a lively interest in the flock dear to her late husband. The church, which will accommodate about 160 persons, consists of nave and chancel, and is constructed of red and black brick, in the decorated style, with Bath stone dressings. The chancel window is adorned with stained glass, of geometrical design, and the south windows of the nave are filled with quarries, surrounded with coloured borders. Behind the altar, is a handsome reredos of stone, diapered, and relieved with blue and gold. There is a nicely-placed credence in the north wall, adorned with tracery and symbolical clusters of grapes, and ears of corn. The sanctuary is paved with Minton's encaustic tiles. The altar rails are of stained deal, as well as the other fittings of the church. The front, of Caen stone, is octagonal, and inlaid with coloured marbles. The oak porch on the north side, is well proportioned, and imparts a pleasing and picturesque appearance to the building. As a whole, the church is as chaste as it is unpretending, and reflects the highest credit on all concerned in its erection. Annexed to the church, is a neat school and teacher's residence, harmonising with it in their general character.

STAPLEFORD.—The nave and aisles of this church having lately been restored and partially rebuilt, will be opened on Thursday, June 12. Collections will be made at the offertory in the morning and after the evening service, in aid of the fund for restoring the church, in which there is a deficiency of about £150.

THE CATHEDRAL OF GLASGOW.—We have heard of the safe arrival of the painted glass for the east window of one of the noblest Gothic monuments in Scotland, Glasgow Cathedral. The figures in the new window, the gift of the Crown, represent the Four Evangelists, and are from the designs of Professor John Schrandolph, whose works in fresco are well known. Another window of special local interest, the gift of the member for Glasgow, Mr. Buchanan, and of Mr. Hamilton, of Minard, has also reached the cathedral in safety. The three subjects are taken from the parable of the King and his servants, and have been designed by Mr. George Fortner, the author of several windows already in the cathedral.

PENNICUIK FREE CHURCH.—The foundation stone of the new Free Church at Pennicuik, near Edinburgh, was laid on Tuesday, by Duncan Cowan, Esq., of Beeslock. Mr. Cowan stated that the cost of the new edifice would be £2,050, of which there had already been subscribed £1,844, and £1,004 8s. paid up. The new edifice, which will occupy a site of much beauty, in the vicinity of fine natural scenery, will, when completed, be a great ornament to the neighbourhood in which it is to be placed. Its proportions will be handsome, its style of architecture in keeping with the locality; and a steeple of one hundred feet in height will give to the building an elegant and distinctive character. The church will be seated for 600 persons. The design of the edifice is taken from plans furnished by Mr. Frederick Thos. Pilkington, architect.

ST. CUTHBERT'S, DARLINGTON.—The faculty enabling the commissioners appointed to carry out the work of restoring the ancient and fine old parish church of Darlington, to commence operations, has been received. The subscriptions now amount to £3,302 12s., which will more than cover, according to the estimate of Mr. George Gilbert Scott, the architect appointed to make the alterations, that portion of the work which it has been determined to carry out immediately. The estimated sum is £3,250, comprising £1,550 for restoration of building, and £1,700 for re-pewing. The total estimate to put the edifice in thorough and substantial repair, as well as to make it permanently safe and secure, amounts to £6,200, but the difference between the two estimates is for work which will either admit of some delay, or has been abandoned—perhaps, for ever, but certainly for some considerable period. With a view to promote the object, the Architectural Society and Archaeological Society of Durham and Northumberland have determined to pay a visit to Darlington on Tuesday, the 3rd of June, and Mr. Scott has consented to read a paper on the prominent architectural features of the building; the Rev. J. G. Pearson, the incumbent, to read a paper on its history; and Mr. Longstaff, of Gateshead, and Mr. Abbott, of Darlington, to exhibit and speculate upon some ancient coins in their possession. A number of the members of the Yorkshire Society are expected to join them.

MONUMENT IN YORK MINSTER.—A very elegant Gothic mural monument is now being erected in the south aisle of the choir of York Minster, bearing the following inscription:—"To perpetuate the Remembrance of Two

Members of this Cathedral Church, departed to the mercy of God: William Mason, Canon Residentiary, and Rector of Aston, whose poetry will be his most enduring monument; born, 1724; died, 1797; and his nephew, William Henry Dixon, Canon Residentiary, and Vicar of Bishopthorpe; born, 1783; died, 1854; this Monument is erected by Mary Ann Dixon, widow." This monument has been executed by Skidmore, of Coventry, whose screen in metal work for Hereford Cathedral forms so prominent and attractive a feature in the International Exhibition. The monument now being placed in York Minster is in the same style of workmanship, and will form another to the many beauties of that noble cathedral.

ST. JOHN'S EPISCOPAL CHURCH, EDINBURGH.—A stained glass window, of great beauty, both in the design and in the colouring, has just been erected in this church, by Mrs. Gray, of Carsegray, in memory of her deceased husband. There are three distinct subjects represented on the window—the chalice, surrounded by vine leaves and bunches of grapes (emblematical of Christ, the true vine); an *Agnus Dei*, of the same design as that in Merton College, Oxford (emblematical of the Lamb of God, that taketh away the sin of the world); and (what forms the chief picture on the window) the proclamation of the "good tidings of great joy," by the angels, to the shepherds, on the plains of Bethlehem. The window was executed by Messrs. Chance, of Birmingham.

WALSOKEN.—The laying of the first stone of the chapel-of-ease at New Walsoken, took place yesterday (Thursday) afternoon, Mr. Young, the Mayor of Wisbeach, performing the ceremony.

WORCESTER.—The Baptists of Worcester have purchased, for 2,000 guineas, some property in Nicholas Street, in that city, for the site of a new chapel.

MELBOURNE.—The *Melbourne Herald* says that "the Wesleyan Methodists have built for themselves the finest ecclesiastical structure in Melbourne—a cathedral-like structure—at a very large cost."

EGREMENT CHURCH, NEAR LIVERPOOL.—Mr. Henry Jefferson, of Springfield, has put three large memorial windows, of stained glass, in the east end of Egremont Church, in affectionate remembrance of his late wife. Each square shows some particular incident of our Saviour's life, from his birth to his ascension. These, together with four windows of stained glass, which Mr. McClellan put in a few years ago, give the east end of the church a rich appearance. The stone work, which is very elegant, was executed by Mr. W. Ellbeck.

RESTORATION OF CHICHESTER CATHEDRAL.—Since the spring weather set in, the work at the cathedral has progressed rapidly; of the four piers which are to support the spire, one has already reached a height of fourteen feet from the ground level, and the other three are nearly as high. By the present contract, Mr. Bushby was required to have all four of the piers fourteen feet high by the middle of June, but they will be completed before that time. This looks very hopeful, more especially as the way in which the work has been done has called forth the highest encomiums from Messrs. G. G. Scott and Slater, the two architects. In the course of a few days it will be settled who is to have the contract for finishing the work for carrying the spire up to its original height.

GREAT SWEATON.—The church at Great Sweatton, near Northallerton, Yorkshire, has been reopened, after having been closed for about three quarters of a year; while undergoing a work of restoration, at a cost of about £800. The restoration has been effected from plans by Mr. G. E. Street, of London. The open roof has been slated with green, blue, and red slates alternating, and surmounted on the chancel, nave, and porch with a cross. The nave, paved with blue stone and red tiles at the corners, is provided with handsome open seats of pitch pine, varnished, &c., about 3 ft. in height. All the sittings have shelves in front, whereon to place prayer and hymn books, &c. The pulpit is entirely new, of fine limestone, mounted with a very handsome brass desk. The old Romanesque font, with its massive oaken cover, is placed on the south side of the western end of the nave. The chancel, restored entirely at the expense of the rector, the Rev. M. Anderson, jun., is paved with Minton's tiles, and has a handsome domed roof. The stalls, which are of oak, are fitted up with good taste, and the chancel is enhanced in appearance, having a very handsome and ornamental screen. An oak lectern, from which the lessons will be read, is placed outside the screen, and the prayers will be read from the stalls. The altar rails are of oak; and the altar table, covered with handsome green cloth, has a super-altar of black marble, from the Isle of Man. The reredos, both beautiful and massive, is of marble, inlaid with alabaster, with a Maltese cross of coloured marble in the centre. The east window is of richly stained glass, being a memorial. The old church had no vestry, which was found to be a great inconvenience. That is now obviated by a small but comfortable vestry, built on the north side of the chancel, over the doorway of which is a handsome scroll, with an appropriate inscription.

OPENING OF TREDEGARVILLE BAPTIST CHAPEL, ROATH.—On Thursday this place of worship was opened. The new structure, which is of a very pleasing and commodious character, will cost about £3,200, a great part of which is collected; and as a gentleman has promised with his donation of £110, to add 5 per cent. on the amount collected up to the opening services, the managers are anxious to do the best they can towards clearing the whole off, and to commence their career free from that terrible enemy—debt. Messrs. Habershon and Pitt, of Newport, were the architects, and Mr. Stride, of Cardiff, the builder. The chapel is situated between Cardiff and Roath, and is in the early English Gothic style of architecture, having a transept and nave of equal dimensions, being 70 ft. by 44 ft. There is room for 1,100 persons, and the seats are very comfortably formed as to room, &c. There is no pulpit, but a semi-circular platform, erected after the

manner of the one in Mr. Spurgeon's Tabernacle. The baptistry, which is in front of the platform, and is raised about 3 ft. above the chapel floor, is of Bath stone, with marble seats inside.

PROPOSED ENLARGEMENT OF ALL SAINTS' CHURCH, PAVEMENT, YORK.—It is proposed to extend the whole width of the east end of the church to the extremity of the present flagging, viz., 9 ft., and to give up to the board of health an equal number of square feet of the churchyard on the south-east side of the church, in order that Coppergate might be widened. Any additional ground required by the Council for the further widening of Coppergate, or at the west end of the church for the proposed Corn Exchange, the rector intimates would be sold to them at £1 a square yard, and he also claimed the right of selling the ground now used as a footpath between Coppergate and High Ousegate. The proposed enlargement is opposed, not merely because it would produce an obstruction and a curtailment of the space now used for the corn market, but also on the ground that the church at present is more than sufficient to accommodate the parishioners who attend the above place of worship. There seems to be a strong feeling in the parish against the proposed enlargement.

GENERAL ITEMS.

STATUE OF LORD MACAULAY AT CAMBRIDGE.—We understand that Mr. Woolner has been selected to execute the statue of Lord Macaulay, which is to be placed in the library of Trinity College, Cambridge.

MONUMENT TO THE LATE LADY JOHN MANNERS.—A monument, which is said to have been admirably executed, has been erected by Lord John Manners, in Rowsley Church, near Haddon Hall, in memory of his lady, who died on the 7th of April, 1854. In style it resembles the middle-pointed Gothic, having upon it the figures of a female and child, enveloped in ample drapery, in a recumbent position, with an angel at the head, apparently smoothing the pillow. These figures, with the carved capitals, panels, &c., are of white statuary, the columns of russet marble, and the other portions of Darley Dale stone. The monument is placed in the centre of a mortuary chapel erected specially for its reception, the floor of which is inlaid with rich marble mosaics, displaying the circle and the cross, emblematical of "Eternity and Religion." The whole has been designed and executed under the superintendence of A. Salvin, jun., Esq. The figure was executed by Mr. Calder Marshall, R. A., and the sculpture and architectural part of the monument by Mr. J. Forsyth, of Hampstead Road, London. The beautifully inlaid floor was executed by Mr. A. Tomlinson, of the Museum, Bakewell, and the design and the materials employed—the Derbyshire red and grey marbles—give the interior a very rich effect. The whole of the materials used are from Derbyshire. As a work of art it will doubtless be an object of interest to the tourist when visiting Haddon. Lady John is the only member of this noble family interred in this neighbourhood for upwards of 200 years.

THE McNICOLL MONUMENT.—It is proposed to erect a monument to the memory of Mr. McNicoll, the late steward of the Earl of Airlie. The form for commemoration intended is that of an obelisk, to be erected in Alyth Churchyard. It is not expected any difficulty will be found in raising a sum sufficient to accomplish so desirable an object.

THE STURGE MONUMENT, BIRMINGHAM.—Wednesday next has been fixed upon for the inauguration of the memorial statue of the late Mr. Joseph Sturge, at Five Ways, Birmingham. The pedestal is now complete, and in the course of a few days the central and subordinate figures will be placed. It was intended that Lord Brougham, a fellow-worker with Mr. Sturge in the anti-slavery cause, should have presided at the ceremony, but his lordship does not expect to be in England at the time. The borough members, Mr. Cobden, Sir J. Pakington, Mr. Adderley, and others are expected to be present.

PRINCE ALBERT MEMORIAL AT OXFORD.—The fountain in St. Giles, Oxford, with a statue of the Prince Consort substituted for King Alfred, has been given up; and at a public meeting it has been resolved to add a new wing to the Radcliffe Infirmary, to be called the Albert Wing. There appears to be £3,000 in hand for the purpose, and half as much again is required, the raising of which will constitute the memorial.

DEMOLITION OF THE MARTELLO TOWER AT GILLINGHAM.—A party of Royal and Indian Engineers have commenced the demolition of the old martello tower—erected in the reign of Charles I., at Gillingham, to protect the entrance to Chatham harbour—to make way for the proposed enlargement and extension of Chatham dockyard. The tower is of great strength, and will be destroyed by means of heavy charges of gunpowder.

THE BURNING OF QUEEN'S COLLEGE, CORK.—The preparatory notices to entitle the authorities to seek compensation from the ratepayers of Cork city for the malicious burning of the college have been served on the parties deputed by law to receive them. The estimated value of the property destroyed is £7,060, of which £5,000 is claimed by the commissioners of the Board of Works for the injury to the building and the destruction of public property, and £2,060 by the professors and students, as the value of the personal property belonging to them which had been consumed.

SEWAGE OF TOWNS.—The Select Committee on the Sewage of Towns have agreed to the following first report:—"1. That careful and exact experiments are necessary to elucidate the agricultural value of sewage, and the best mode of applying it. 2. That such experiments have been carried on at Rugby by the commission appointed to inquire into the best mode of distributing the sewage of towns, and applying it to beneficial and profitable use. 3. That it is desirable that these experiments shall be continued during the present year."

CRYSTAL PALACE ART UNION.—Subscribers of one guinea have, in addition to their chance in the forthcoming prize distribution, the right of selecting a presentation work from a copyright series of fifty art manufactures of varied design and great excellence. An illustrated prospectus may be had on application to the London and provincial agents, and at the Crystal Palace, where specimen works are on view.

PROPOSED PLACE OF WORSHIP FOR THE DEAF AND DUMB.—It is proposed to erect a place of worship for the Deaf and Dumb, a Home for the Aged, &c., in connection with the Association in aid of the Deaf and Dumb. The Right. Rev. the Lord Bishop of London is the patron, and the committee appeal for assistance to erect an edifice, which is to comprise a place of worship for the deaf and dumb, as they require religious instruction conveyed in the finger-and-sign language to be profitable; a home for the aged and infirm; and a room for secular lectures, evening reading, &c., as a counter attraction to lower places of resort.

CHRIST CHURCH, PENTONVILLE.—A recent appeal by Dr. Courtenay states that the necessity for this church, for a population of 14,000, all admit. The evils, both physical and moral, sought to be counteracted by it, are known to many, and the materials on the ground must decay if the work is not forthwith resumed. The Bishop of London, to meet the extreme urgency of the case, will consecrate the nave on its completion. £2,000 are required. Churchmen who can sympathise with their poorer brethren, and who love to see their own principles effectively applied, will rarely find an undertaking combining so many points of interest. One metropolitan parish, impressed by the importance of the objects, applied very lately, through their Churchwardens, a portion of the offertory to this church and the mission work at Pentonville.

THE CATHOLIC UNIVERSITY OF IRELAND.—The foundation-stone of the new Catholic University will be laid on the third or fourth Sunday of July. The time has been selected with a view to the presence of several of the prelates of America, on their return from the Eternal City; and, in addition to the Irish episcopacy and clergy generally, some of the most eminent of the bishops of France, and a few of the rectors of the continental universities will be present. Every grade of Catholic educational institution in the kingdom, from the village school to the University, will be represented.

OPENING OF THE NEW BRIDGE AT WESTMINSTER.—On Saturday, at the early hour of 4 a.m., the long-expected opening of the new Westminster Bridge for traffic took place. This early hour was selected as being the hour of the birth of her Majesty on May 24, 1819, at Kensington. But for the lamented death of the Prince Consort, the bridge would have been opened by Her Majesty in person. A salute of 25 guns was fired, corresponding with the number of years which Her Majesty has reigned. The new bridge is very nearly twice as wide as any of the bridges over the Thames. Within the parapet it is 84 ft. 2 in. wide. Of this the footways occupy 28 ft., the road for the light traffic 39 ft., the tramways 14 ft. 8 in., and the space between them 2 ft. 6 in. The tramways consist of iron plates bolted to timbers, and laid upon an elastic bed of cork and bitumen. The kerb of the footway is formed of Ross of Mull granite; the footway itself is of Blashfield's terra-cotta. It inclines towards the parapet with a fall of 1½ inch, and a gutter on each side carries off the water. The value of this material for paving purposes may be estimated by the fact that when rubbed with sand and water against Yorkshire stone the stone lost twice as much as the terra-cotta. The pavement is laid in diamonds, and it has a very pleasing effect. The spans of the different arches are: No. 1 and 7 arches, span 94 ft. 9 in.; Nos. 2 and 6, 104 ft. 6 in.; Nos. 3 and 5, 115 ft.; centre arch, span 120 ft. The arches are formed of seven ribs, which are of cast iron, with the exception of the crown or centre pieces, which are of wrought iron, as owing to their not being so deep at this part, greater strength of metal is required. The foundations of the bridge were formed without the use of the time-honoured coffer-dam, and the large expenditure which the construction of them would have involved has, therefore, been saved. A series of piles were driven into the bed of the river, which form the base upon which the piers were to rest. There are 145 piles in each pier, and they are driven to an average depth of 29 ft. The pressure on the bearing piles of the bridge is 15 tons, while upon the London Bridge it is as much as 80 tons; the pressure on each square foot of ground is but two tons, as compared with five and a half tons at London Bridge. The roadway of the new bridge is 12 ft. lower than that of the old Westminster Bridge, the gradient at the centre arch is 1 in 362, at the two next 1 in 123 and 1 in 75, the two next 1 in 57, and on the abutments 1 in 54. The following is a statement of the quantities of materials used in the construction of the new bridge: Timber in bearing piles, 45,700 cubic ft.; cast iron (in foundations), 1,600 tons; ditto (in superstructure), 2,600 tons; wrought iron (in foundations), 70 tons; ditto (in superstructure), 1,300 tons; Granite and other stones (in the piers and abutments), 165,000 cubic ft.; brickwork (in Portland cement), 21,000 cubic yards; concrete (in Portland cement), 30,000 cubic yards. The old bridge, which has now been superseded, has stood for 110 years, and, with very slight interruption, had during the whole of that period afforded accommodation for the yearly increasing traffic between the two sides of the river. The bridge was commenced in 1739, and after twelve years was completed at a cost of £380,500. It was originally intended to have been built of wood, and some progress was made in the foundation of the piers for a work of that description, when it was afterwards found necessary to build it of stone. Westminster Bridge was the second bridge erected in the metropolis, and at that time there existed only Old London Bridge, with its steep ascent and narrow roadway of twenty feet, a noble gateway, a chapel, and other buildings, which had stood for nearly six centuries, had twenty arches, the

whole water-way being but 450 ft. When Laylodaye proposed, therefore, to open the river by a stone bridge with only thirteen arches, he was considered a bold and rash man. He, however, succeeded, and Westminster Bridge was accounted one of the wonders of the world. The arches were thirteen in number, with two small culvert arches. It provided a clear waterway of 820 ft., or nearly double that of Old London Bridge. The present bridge was commenced in May 1851, but various delays subsequently occurred, and it was not till about the middle of 1859, that Mr. Page was enabled to proceed vigorously with the bridge, which is the fourth constructed by that engineer over the Thames.

BUILDERS' BENEVOLENT INSTITUTION.—ELECTION OF PENSIONERS.—Yesterday (Thursday) afternoon, a meeting of the Builders' Benevolent Institution was held at the London Tavern, Bishopsgate Street, for the purpose of electing three pensioners—two males, and one female. The chair was occupied by Joseph Plucknett, Esq. There were thirteen candidates, and the following were elected:—Robert P. Day, 34 Grey Street, Welberv Row, Blackfriars Road, aged 61; builder, &c. Is paralysed on the right side, with speech affected, and is totally unable to earn his living.—Thomas Lawrence, 9 Desborough Terrace, Harrow Road, aged 66; who for 16 years carried on the business of a bricklayer and builder, in Rolls Buildings, Fetter Lane; has suffered for several years from a chronic affection of the lungs, that incapacitates him for business.—Sarah Wright, 27 St. Paul's Terrace, Camden Town, aged 68; widow of the late W. Wright, plasterer, Camden Town, who died three years ago, leaving her totally unprovided for. She has hitherto entirely supported herself by her own exertions, but from ill health and defective sight is no longer able to do so.

TENDERS.

PUBLIC-HOUSE AT TONGHAM, NEAR ALDERSHOTT.

For additions and repairs to a public-house at Tongham, near Aldershot, for William Cave, Esq. Messrs. Eggar and Stapley, architects, Farnham.

F. Birch, Farnham.....£400 0 0

For building a public-house, stabling, and coach-houses at Aldershot, for Henry Hall, Esq. Messrs. Eggar and Stapley, architects.

F. Birch, Farnham.....£1,100 0 0

HOTEL, UTOXETER.

For alterations to the White Hart Hotel, Utoxeter. Mr. R. Scrivener, architect.

Sheppard, Derby.....£562 0 0 | Mathews, Leek.....£560 0 0

SCHOOL ROOM AND CLASS ROOMS, BEDFORD.

For the erection of a new school-room and class-rooms, attached to Howard Chapel Bedford.

Haynes.....£574 0 0 | Hull.....£475 0 0

Reynolds and Son.....532 0 0 | Houghton.....462 10 0

Corby.....520 0 0 | Francis and Son.....442 4 0

Norman.....490 0 0

The tender of Francis and Son was accepted, and the works, we understand, are to be commenced forthwith.

COUNTY GAOL, HEREFORD.

For additions and alterations to the Hereford County Gaol. Mr. Wm. Chick, County Surveyor, architect.

Pearson and Son, Ross.....£2,070 0 0 | Ruddle and Thompson, Peter-

Wish, Hereford.....1,562 0 0 | borough (accepted).....£1,495 0 0

Bigglestone, Hereford.....1,325 0 0

COMPETITIONS OPEN.

CATHEDRAL.

CORK.—Architects are invited to furnish designs for the erection of the cathedral of St. Finbar, Cork, at a cost not exceeding £15,000. A premium of £100 will be given for the best and most approved plan, and £50 for the second. Plans and designs to be sent to the hon. secretaries, Ven. the Archdeacon of Cork, Rev. J. N. Woodroffe, or T. M. Osborne, Esq., Cork, not later than the 1st of August next. Further information and a plan of the site may be obtained on application to W. C. Bennett, Esq., notary public and Chapter clerk, 15 South Mall, Cork.

CHURCH.

LEAMINGTON.—Plans and estimates, in sections, are required for the completion of the parish church of Leamington. The nave, the chancel, and the north transept being already built, it is intended to proceed to erect the remaining portions of the work in sections. Architects are invited to send in plans and estimates, in sections, for erecting the south transept, the vestry, the lantern tower, and the bell tower; which it is intended to build in strict harmony with the architectural style of those portions of the church now erected. Increased accommodation in the church is most desirable. A premium of £30 will be given for the best set of plans and estimates in the opinion of the Committee, which must be sent, sealed and under motto, to Mr. G. Rogers, Newbold Street, Leamington, on or before the 21st June, of whom all further particulars may be obtained.

SCHOOL.

RADNOR.—Plans and specifications are required on or before the 1st June, for the Knighton National School, Radnorshire, comprising Boys', Girls', and Infants' School and Class Rooms, together with residences for Master and Mistress. For information as to site and other particulars, apply to the Rev. J. R. Brown, incumbent of Knighton.

LIBRARY AND READING ROOMS.

BIRMINGHAM.—The Free Libraries' Committee of the Council of the Borough require plans, sections, specifications, and estimates for the erection of a free reference library and reading-rooms, lending-library and news-rooms, and gallery of art, upon the piece of vacant land adjoining the Midland Institute Building, with an elevation uniform with the said building. Intending competitors are requested to send in their plans, specifications and estimates, under cover, to Thomas Standbridge, Town Clerk, Town Clerk's Office, Temple Street, endorsed "Plans for Free Reference Library Buildings," on or before the 16th June. Particulars of the accommodation required, and of the conditions of competition, together with a lithographed plan of the site, may be obtained on application.

MEMORIAL.

GLOUCESTER.—The committee appointed to carry out the Hooper Memorial, at Gloucester, invite sculptors to submit models of designs for the figure of Bishop Hooper, which is intended to be placed under the canopy of the monument just erected in the churchyard of St. Mary de Lode, Gloucester. The models or statuettes to be carved in stone, and to be one quarter the real height (7 feet). The author of the best design, approved by the committee, will be appointed to execute the full-sized figure, and the sum of ten guineas will be awarded for the second-best design.

ALMSHOUSES.

SALTERS' COMPANY.—A plan is wanted by the Salters' Company for almshouses to accommodate twelve almswomen and six almsmen, on a plot of ground, about twenty miles in the country, comprising two acres. It being proposed to expend on the buildings and the necessary drainage a sum not exceeding £5,000, a premium of £100 is offered for the plan which shall be considered the most eligible for the purpose. The successful party will be expected to furnish a proper specification of the requisite works, and the premium will be paid immediately it is ascertained to the satisfaction of the Court of Assistants that the proposed buildings can be erected for the sum mentioned. A plan of the ground and statement as to accommodation wanted can be seen at the office of the Clerk of the Company, at Salters' Hall, St. Swithin's Lane; at which office the plans must be delivered on or before Tuesday, the 3rd day of June, 1862, before 12 o'clock at noon.

WORKHOUSE.

CARLISLE.—The Guardians of the Carlisle Union offer a premium of £50 for the set of plans approved by them and the Poor Law Board, for a new workhouse, capable of accommodating 500 adult inmates, and designed in such a manner as to allow of enlargement, without interfering with the uniformity of the external appearance. The site for the erection of the said workhouse is situated at Fusehill, on the east side of Carlisle. All plans to be sent to the Clerk on or before June 23.

HANTS.—For the works required to be done in making certain alterations in, and additions to, the Alverstoke Workhouse. Plans, &c., at the Board-room of the workhouse on and after the 15th May, or at the office of Mr. Thomas Hellyer, Bouverie House, Hyde, Isle of Wight, architect, of whom every information may be obtained, and bills of quantities may be had.

GAOL AND HOUSE OF CORRECTION.

EXETER.—The Town Council of Exeter are desirous to be informed if the present City Gaol and House of Correction can be made available so as to satisfy the requirements of the law, as to the construction of gaols and houses of correction; and they invite architects to ascertain if it is practicable that the present City Gaol and House of Correction can be so altered. They offer a premium of £30 for the plan of alterations which shall be considered the best, and if such plan be carried into effect, the architect producing it will be employed to superintend the execution of the work at the usual commission, but in that event his premium is to merge in his commission. A premium of £30 will be given for the plan which shall be considered the second best. Plans to be sent in before the second Wednesday in June.

CONTRACTS OPEN.

BARRACKS.

CHATHAM.—For improvements to soldiers' casemated barracks, St. Mary's. Tenders to be left at the Royal Engineer office, Chatham, where bills of quantities may be obtained up to Friday the 30th inst.

ALDERSHOT.—For painting externally the cavalry barracks, Aldershot, in the county of Hants. Copies of the specification, conditions of contract, and forms of tender to be had at the Royal Engineer office, Aldershot, up to the end of June proximo.

WOOLWICH.—For renewing the slating and lead gutters of the soldiers' barracks, right wing, Royal Artillery Barracks, Woolwich, by measurement. Parties desiring to tender for the execution of these works, to leave their names at the Royal Engineer office, Woolwich, on or before the 4th June.

COAST GUARD STATION.

HAYLING BRIDGE, HANTS.—For the erection of a coast guard station at Hayling Bridge, near Havant, Hants. Drawings and specification may be inspected at the Coast Guard Station, Hayling Bridge, or at the Admiralty Coast Guard Office, Spring Gardens, London, to Saturday, 31st May; and tenders received up to the end of June.

METROPOLITAN MAIN DRAINAGE.

SOUTHERN OUTFALL WORKS, CROSNESSE.—For the construction of engine-houses, a boiler-house, chimney, fifth-boists, coal-sheds, dwelling-houses, wharf-wall, sewers, and other works in connection therewith, at Crossness, Erith, Kent. Plans, &c., may be obtained at the Metropolitan Board of Works office, Spring Gardens, until 3rd July. Tenders to be sent in on 4th July.

CHURCHES, ETC.

SITTINGBOURNE, KENT.—For the erection of a new church at Sittingbourne, Kent. Plans to be seen at the office of Mr. Wimbles, Walbrook, Mansion House, London, and tenders will be received by Mr. Smith, Rose Place, Sittingbourne, up to the 31st May.

IRELAND.—For the erection of a new Catholic church, to be built at Kenmare. The parish priest will show the plans and specifications, and will receive tenders up to June 1.

CROPREY, OXON.—For the renovation and enlargement of All Saints Church, in the hamlet of Great Bourton, Cropredy, near Banbury, Oxon. Plans to be seen at the office of Mr. William White, architect, Wimpole Street, London to the 24th inst., and at 8 High Street, Banbury, to the 2nd of June. Tenders received to June 3rd, by the Rev. the Vicar of Cropredy.

CHAPELS, ETC.

USK, MONMOUTHSHIRE.—For the erection of a new chapel and vestries on the site of the present Congregational chapel at Usk, Monmouthshire. Particulars may be obtained of the architects, Messrs. W. G. Habershon and Pite, 38 Bloomsbury Square, London; Park Square, Newport, Monmouth; and Belvedere, Tredegarville, Cardiff.

PLYMOUTH.—For a new Congregational chapel and schools at Plymouth. Plans to be seen at Norley Chapel School-rooms, Plymouth. Tenders received up to 2nd June.

LEEK.—For the execution of the Stonemason and Bricklayer's work, in one Contract, of the proposed new Congregational chapel and schools at Leek. Drawings, specifications, and particulars may be obtained at the office of Mr. William Sugden, architect, to the 31st inst.

COWBRIDGE, HERTFORD.—For the taking down of Cowbridge Chapel, Hertford, and the erection of a new Congregational chapel and schools on the present site. Plans and specifications at the old Chapel School-room, and at the office of the architects, Messrs. T. Smith and Son, 33 Bloomsbury Square, London, on and after Wednesday, May 28. Tenders to be delivered not later than Thursday, June 5, addressed to the Secretary, Mr. A. Wenham, Port Hill, Hertford.

SCHOOLS.

DEPTFORD.—For making alterations and additions to the school of John Addey's Charity, Deptford. Plans and specifications may be seen, and further particulars obtained on application to Joseph Liddiard, Esq., architect, 5 Kent Terrace, Upper Road, Deptford. Tenders to be delivered at the offices of Mr. W. Sandom, Solicitor, Slades Place, Deptford, on or before 2nd June.

EVERTON.—For cleaning, painting, &c., St. Peter's Church Schools, Sackville Street, Everton. Tenders received to the 31st inst.

VILLA.

HANTS.—For the erection of a villa residence at Botley, Hants. Plans, &c., at Mr. Hardy's, harness manufactory, on and after the 22nd inst. Tenders to the architect, Mr. John Colson, St. Swithin Street, Winchester, on or before the 5th June.

ROAD-MAKING, ETC.

FINCHLEY.—For making road and drains at Finchley. Plans to be seen at the office of Mr. V. France, Solicitor, 37 New Bridge Street, Blackfriars.

DWELLING HOUSES.

STAFFORD.—For the erection of five houses, at Forebridge, for Mr. John F. Bridgwood, Wolverhampton Road, Stafford. Drawings, &c., with Mr. Henry Ward, architect, Bank Passage, Stafford.

PARSONAGE HOUSE.

ABERAYRON.—For building a parsonage house for Henfynnyw, at Aberayron, Cardiganshire. The drawings and specifications to be seen at the Feathers Hotel, Aberayron, from Monday, 19th May, until Saturday, 31st inclusive. Further information may be obtained from the architect, Mr. R. J. Withers, 51 Doughty Street, London. Tenders to be delivered to the architect, on or before Monday, 2nd June.

RESERVOIR.

BLACKBURN.—For the construction of a new reservoir, to be called the Fish Moor Reservoir, adjoining the Guide Reservoir, near Blackburn, for the Directors of the Blackburn Waterworks. The work will consist principally of an embankment of 47 feet in height, containing about 340,000 cubic yards of material, with the masonry, stone beaching, and other work connected therewith. Plans, &c., at the office of the Water Company, Clayton Street, Blackburn; and at the office of Mr. Bateman, engineer, 9 St. James's Square, Manchester, and sealed tenders (a form of which may be had on application), endorsed "Tenders for Fish Moor Reservoir," must be sent in, addressed to "The Chairman of the Company," not later than the 5th June.

POLICE STATION.

SIDMOUTH.—For the erection of a police station, &c., at Sidmouth, Devonshire. Plans, &c., with Henry Ford, Clerk of the Peace, Castle of Exeter, and at the office of Messrs. Radford and Williams, Clerks to the Justices, Sidmouth. Sealed tenders, endorsed "Tender for Sidmouth Police Station," to be sent to Mr. Ford, on or before the 3rd June.

DRAINAGE WORKS AND STREET IMPROVEMENTS.

GRIMSBY, LINCOLNSHIRE.—For the erection of the following works:—Contract No. 1. Works of drainage. For the formation of 4,000 yards lineal of glazed pipe-drains, from 8 to 18 inches diameter, with outfall sluice, penstock, and other appliances. —Contract No. 2. Works of Street Improvement: comprising about 1,200 yards super of Yorkshire stone flagging, and 14,500 yards lineal of kerbing to footways; 17,950 yards

lineal of flagging, and dwarf kerbing to channels, and 425 yards super of pitching to crossings. Plans, sections, and specifications, &c., may be seen at the Office of Mr. Joseph Maughan, Surveyor to the Local Board of Health, in Haven Street, Grimsby, until Saturday, 31st May instant, on which day Tenders for either or both of the Contracts must be delivered at the Office of the Clerk to the Local Board.

IRONMONGERY.

INDIA.—For the supply of Ironmongery for the Director General of Stores for India. Particulars may be obtained at the India Store Office, Cannon Row, Westminster, and tenders received up to the 2nd of June.

FLINTS.

MORTLAKE.—To send to the Surveyor of Highways, Mortlake, Surrey, the price per cubic yard at which Broken Flints can be delivered at the Ship Dock, Mortlake.

REPAIRS AND PAINTERS' WORK.

KENSINGTON.—For Sundry Repairs and Painters' Works to be done to the Vestry Hall, High Street, Kensington. Particulars of Mr. Broadbridge, Surveyor, at the Vestry Hall, and tenders received up to the 6th June.

SEWERAGE WORKS.

HAM COMMON.—The Local Board of Health for the district of Ham Common, in the County of Surrey, are prepared to receive tenders from parties willing to undertake the following contract:—No. 1. For providing earthenware sewer pipes, cast iron pipes, and other materials; excavating for, laying and jointing pipes, constructing man-holes, fixing gullies, and other works. Plans, sections, drawings, and specification may be seen, and duplicate forms of tender, bills of quantities, and schedules for prices, obtained at the office of John Lawson, Civil Engineer, 34 Parliament Street, Westminster. Sealed tenders, endorsed, "Tender for Sewerage Works," must be sent to the office of the Local Board, Ham Common, Surrey, on or before Friday the 6th day of June.

STOKES-NEON-TAINT.—For the construction of certain sewerage works for the Commissioners of Stoke District. Drawings and specification at the Clerk's office, on and after Wednesday the 28th instant, until Tuesday the 3rd proximo, on which day estimates are to be delivered at the office of the Commissioners.

PUBLIC BATHS.

BURY.—The whole of the works required in the erection of public baths, proposed to be built in St. Mary's Place, Bury, are to be let. Plans and specifications may be seen, and printed copies of the quantities obtained, at 2 Haymarket Street, Bury. Tenders to be sent in not later than Tuesday the 3rd of June.

LOCK-UP HOUSE, ETC.

LLANIDLOES.—For the erection of a lock-up house and constable's residence at Llanidloes. Plans and specification to be seen at the office of Mr. J. W. Poundby, County Surveyor, Kerry, Montgomeryshire.

BUILDING LAND.

CHEAPSIDE.—A valuable site in Cheapside, of about 69 feet frontage, and average 45 feet in depth, to be let on building lease, for a term of 80 years from Lady Day, 1863, suitable for the offices of a public company, or for warehouse or business premises. Tenders received up to 24th day of June. Plans, particulars, and conditions of tender may be seen on application to the Clerk, Saddlers' Hall, Cheapside, E.C.; or to Mr. F. W. Porter, architect, 16 Russell Square.

SLATING, ETC.

WOOLWICH.—For renewing the slating and lead gutters of the soldiers' barracks, right wing, Royal Artillery Barracks, Woolwich, by measurement. Parties desiring to tender for the execution of these works must leave their names at the Royal Engineer office, Woolwich, on or before the 4th day of June.

INFANT SCHOOL, ETC.

WARLEY, ESSEX.—For building an infant school and school-mistresses' quarters, at Warley Barracks, Essex. Particulars to be had at the Royal Engineer office, Colchester.

SICK WARD, WORKHOUSE.

CROYDON.—For the erection of a new sick ward at the workhouse, Duppas Hill, Croydon. Plans, with specifications, may be seen on application to Mr. John Berney, architect, North End, Croydon. Tenders must be sent to the clerk by the 2nd of June.

REPAIRS OF SEWERS, ETC.

BERMONDSEY.—For the execution of general works and repairs to the sewers, gullies, drains, &c., within the Parish of Bermondsey, for the term of one year, from the 25th day of June next, to the 24th day of June 1863. Forms of tender may be obtained at the Vestry office, in Maltby Street. Tenders received up to 2nd of June.

SEWERS.

CAMBERWELL.—For the execution of sewers works, comprising about 660 feet run, 3 ft. 9 in. by 2 ft. 6 in., in Brick Sewer, at Queen's Road, Peckham; 570 feet run, 3 ft. by 2 ft., in Grove Lane; 180 feet run, 12 in. pipe sewer in ditto. Tenders received to June 3rd.

MAIDSTONE.—For laying in pipe sewers of various sizes, in the district of Perryfields, Maidstone, about 3,500 yards in length, with cesspools, traps, gratings, and other works. Tenders to Messrs. Beale and Hoar, Maidstone, on or before the 16th of June.

RAILWAY STATION.

HANSTEAD HALL, NEAR BIRMINGHAM.—For the different works required in the erection of new station, offices, platforms, &c., at Hanstead Hall, near Birmingham, on the Grand Junction Section. Plans and specification may be seen of Mr. Woodhouse, Engineer's Office, Stafford Station. Tenders to be sent in on or before Wednesday the 4th of June.

PAVING, &c.

NEWPORT, MONMOUTHSHIRE.—For new paving, curbing, and channelling, to be laid down in Commercial Road, between the Salutation and Frederick Street. The plan, specification, and form of tender may be seen, and any further particulars obtained at the office of the Town Surveyor. Tenders to be sent on or before Tuesday the 3rd of June.

BOGWOOD.

DUBLIN.—The Commissioners of Public Works will receive, up to 12 o'clock, on the 21st June next, tenders for the supply of about 120 tons of Bogwood, to be delivered in such quantities and at such times as may be ordered, up to June 30th, 1863, inclusive, to the various government offices, &c., in the Dublin District.

MALTING AND CORN CHAMBERS.

BEDFORD.—For the erection of malting and corn chambers, Bedford. Tenders to be delivered on Monday, the 2nd June, at the office of Mr. John Day, architect, Gwyn Street, Bedford.

ENCLOSURE IRON WALLS.

CROYDON.—For the erection of a wrought iron fence or fences, about 1,500 feet in length, with iron gates, &c., for internal enclosures to the burial ground of St. John's Church, Croydon. Tenders to be sent to Mr. H. Richards, High Street, Croydon, on or before Monday the 2nd of June.

VICARAGE HOUSE.

ASKHAM RICHARD.—For the erection of a new vicarage house, at Askham Richard, near York. Plans and specifications at the office of Messrs. Pritchett and Son, York, from Friday morning the 23rd instant, where the tenders are to be delivered, sealed, and directed to the Rev. C. J. Denton, at or before 5 p.m., on Monday the 2nd of June.

CATHEDRAL.

RIPON.—For the re-roofing and groining of the choir, and the restoration of the north-west tower of Ripon Cathedral. The plans, specification, and conditions may be seen at the office of Mr. Clark, Clerk of the Works, Kirkgate, Ripon, and further particulars obtained of Mr. G. G. Scott, architect, 20 Spring Gardens, London. Tenders to be delivered before 12 o'clock on Thursday, 5th June, addressed to Samuel Wise, Esq., Solicitor, Ripon.

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favour us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

Received.—R. S., R. H., G. B., A. M., L. Son, and H., Framework knitters, Dean T., W. L., S. T., J. B., T. H., T. C., G. M., J. P. J., W. D., D. H., F. C. & Co., S. & D., P. S., P. & W., W. R., "Annex" will be attended to, L. L. D., J. H., J. A., W. W., J. B., B. & Co., W. & J.

J. T.—The architects of the Grey Friars' Church, Reading, are Messrs. Poulton and Woodman.

**** NOTICE.**—The BUILDING NEWS is now published at 166 Fleet Street, where all Communications and Advertisements should be addressed.

EUSTON AND CAMDEN.

AMONG the tens of thousands of foreign visitors whom the wonders of the International Exhibition will attract to London during the present summer, there will undoubtedly be many who take an interest in the development of the railway system, and those who wish to learn of its prodigious growth in England, cannot do better than pay a visit of inspection to the Euston Square and Camden Stations. We, who are constantly in presence of the wondrous results produced by the locomotive and the rail, are apt to pass them by unnoticed, or at least without comment. The invasion of the metropolis by the "Steam Horse" has, during the last quarter of a century, produced changes, not only in the physical features of the metropolis, but also in the manners, customs, mode of living, and even in the thoughts of its inhabitants, which are almost incredible. For a century previous to the year 1834, stagnation was the order of the day; but then came the locomotive into London, and all was changed. It is singular to note the obstinate pertinacity with which the introduction of the great reformer into England was opposed. Before the locomotive could proceed on its mission of civilisation, its parent, George Stephenson, and his coadjutors, were compelled to run the gauntlet of ridicule, detraction, and slander, and there are many men of eminence still living who expended lavishly money and eloquence, in obstructing the projects of the great railway engineer.

No doubt the obstructives were, many of them at least, conscientious in their opposition to the introduction of the mighty improvement; but the lesson they have learnt should teach them, and most likely it has taught them, to be less confident, and more cautious in giving opinions adverse to mechanical inventions, and scientific discoveries. As a specimen of the argument and declamation by which the railway schemes of George Stephenson were, in the first instance, met and assailed, let us take an extract from a speech made before a Select Committee of the House of Commons in 1826, by Mr. Harrison, then an eminent parliamentary counsel: "Every part," says he, "of this scheme (the Manchester and Liverpool Railway) shows that this man (George Stephenson) has applied himself to a subject of which he has no knowledge, and to which he has no science to apply."

"When we set out with the original prospectus, we were to gallop at the rate of twelve miles an hour, with the aid of the devil in the form of a locomotive, sitting on the fire-horse. But the speed of these locomotives has slackened. The learned sergeant would like to go seven, but he will be content with six miles an hour. *I will show that he cannot go six.* Practically, or for any useful purposes, they may go something more than four miles an hour. The wind will affect them; any gale of wind which would affect the traffic on the Mersey, would render it impossible to set off a locomotive engine (!), either by poking the fire or keeping up the pressure of steam. A shower of rain retards a railway, and a snow storm entirely stops it." We need not at this time of day pause to comment for a single moment on the remarks of Mr. Harrison. They are curious, and they serve to show the ebb tide of scientific and mechanical knowledge which then prevailed. The flood tide has risen since, and Mr. Harrison has enabled us to ascertain the depth from which the tidal wave has sprung.

The greatest possible obstruction was offered, in 1831, to the proposition for forming a line of railway from London to Birmingham, and from speeches made in both Houses of Parliament, and pamphlets published out of them, it would be easy to cull passages at which their living authors would blush, and our readers would heartily laugh. Those speeches are chronicled in Hansard, whilst the bulk of the pamphlets have gone to the buttermilk, and there they may rest.

It is time for us to return to Euston and Camden. When the North Western Railway was designed, it was intended that its metropolitan terminus should be at Camden Town, but a favourable opportunity offered itself, and the Company purchased fifteen acres of ground at a point nearer to that great artery—the New Road. This newly-acquired area became the site of the Euston Station. It is only to be regretted that the noble gateway or propylæum of the latter, does not immediately face the thoroughfare named. This gateway cost no less than £30,000, and the architect who designed it fondly hoped that the station itself would be formed in accordance with its Titanic style of architecture. The station, however, is exceedingly commodious, and its great entrance-hall is appropriately ornamented by a fine statue in marble of George Stephenson. At this point, we need not say, except to visiting friends, the passenger traffic of the line is managed.

In a very few minutes, we had almost said seconds, the trains from Euston reach Camden, and here a perfect wilderness of lines converge and diverge. Mr. Robert Stephenson, not without some difficulty, induced the directors to purchase 30 acres of land at this spot, and well was it for the interests of the company that his counsels were adopted. The whole area is occupied, and the cry is still *More, more!* It may truly be said indeed of Euston, and its dependency, Camden,

that they form the greatest railway port in the world. It is the principal gate through which flows and reflows the traffic of a line of railway which cost more than twenty-two millions sterling, which annually earns more than two millions and a half, and which directly employs from ten to twelve thousand hands. Of course the number of persons to whom indirectly it gives employment is incalculably large. In mines, mills, factories, and iron-works, in steam and in coasting-vessels, workmen or workwomen are kept incessantly busy by the traffic of Euston and Camden. They form the railway metropolis, of Great Britain, so to speak. The interlacing connections of other railways have now become so numerous that it is possible to reach any part of England or Scotland, from Land's End to John O'Groat's, from this vast point of departure.

It is some few years since the provision made for the accommodation of passenger and merchandise traffic, on the North-Western Railway was estimated at the following amount of "rolling stock," and, with the exception of the first item named, it would at this moment be fair to add thereto one third more.

1	State Carriage.
555	Locomotives and Tenders.
494	First Class Mails.
420	Second Class Carriages.
342	Third Class.
25	Post Offices.
242	Carriages, trucks for letters and newspapers.
201	Guards Breaks.
260	Horse-boxes.
7385	Goods wagons.
14	Trolleys.
1155	Crib rails.
5150	Shuts.
162	Cart-horses.
41	Patent breaks.

At Camden there are extensive workshops for the manufacture and repair of carriages, trucks, &c., but at the Wolverton works, the locomotives of the line are for the most part made and repaired. When our statistics were obtained, the passenger carriages afforded eleven miles of seat room, or sufficient accommodation for 40,196 persons! The loading surface—that is to say, the area of truck-room—is extensive enough for the conveyance at one time of 40,000 tons. The annual consumption of gas at Camden equals from six to seven millions of cubic feet. There are sheds and stables which cover a space of 150,000 superficial feet, and the platforms to receive goods from railway trucks on one side, and wagons on the other, occupy 30,000 feet more.

It would be impossible to convey an idea of the miscellaneous character of the merchandise and materials which is every day and night arriving at or departing from Camden. The heaviest forgings and castings from the various iron-works of the kingdom are constantly to be seen at the heels of the "steam-horse," together with coals, timber, machinery of every kind, and last, though not least, truck loads of cattle, destined to supply, in the form of beef or mutton, the cravings of the inordinate appetite of London. The incessant comings and goings of trains of interminable length, and charged with every imaginable commodity, form one of the main wonders of Camden; and those, therefore, who wish to gain some insight as to the industrial activity of the people of England, can scarcely do better than spend an hour or two at this great station.

The extraordinary line of railway, named in the first instance the Docks Junction, but now rechristened the North London, is a great contributor to the never-ending bustle of Camden. Communicating as it does directly with the East and West India and the Victoria Docks, it bears to Camden, *en route* for every district of the kingdom, the productions of all quarters of the globe, and is the medium for exchanging for them the manufactures of this country. Those indeed who are observant of the activity, as regards goods traffic—to say nothing of the quarter-hour passenger trains—on this tributary of the North-Western Railway, and its constant interchange of goods with the great docks aforementioned, will readily agree with the inscription on the south-east transept of the Exhibition: "Each climate needs what other climes produce." Among the list of "Lions" which the coming hosts of visitors may jot down in their note-books for inspection, they will not do wrong in including Euston and Camden.

Taking the train at Fenchurch Street, and booking for Hampstead Road, three-quarters of an hour or so will suffice to deposit the tourist at Camden. There is another attraction, too; the real lions of London—in the Regent's Park Zoological Gardens—are within a quarter-hour's pleasant saunter of Camden.

INSURANCE OFFICES IN MANCHESTER.

IN our larger cities and towns of importance, we find that the offices of the numerous Insurance Companies form very noticeable

features in the architectural works of the place, and contribute in no small degree, by their richness, to render the neighbourhood in which they are situated more attractive and important. Generally speaking, these buildings are carried out in a liberal spirit, and the architect is in most cases enabled by the money placed at his disposal, to design an edifice which shall possess sufficient attractiveness and beauty to stamp it as an establishment of the first class. There is perhaps no class of buildings on which so much taste is bestowed as Insurance Offices, and none which in number, size, and ornamentation add so much to the appearance of our towns. So well is this known, that persons accustomed to travel in England seldom fail to look for them among the principal public buildings of our cities, and those, in particular, who are interested in the architectural progress of the country, are well aware of the prominent position they have taken and the great variety of examples which they present of the taste of our modern designers. In all directions they are springing rapidly into existence; some possessing attractions of no common order, while others, on the contrary, are miserable displays of ugliness, and may be classed with the numerous abortions which are so rapidly accumulating on every side. Want of money is a complaint which almost every architect makes, with an earnestness that is quite refreshing; and we should be wanting in politeness were we to suggest that in many instances an increase of funds at his disposal, instead of furnishing him with power to add to the beauty of his work, would only aggravate the evil, by inducing him to crowd a façade of a bad design with a superabundance of ornament. Yet this is really the case, and in many of the buildings erected by Insurance Companies these remarks are fully borne out by the lavish expenditure of money on misplaced and ill-designed ornaments, which could have been well spared, and their cost saved. But on the other hand, liberal supplies to men of ability are profitably invested, for by such means they are enabled to impart an increased richness to their designs without in any way lessening their beauty or destroying their purity. The spirit of rivalry existing between the different Insurance Companies urges them to erect offices which shall be superior to those of their rivals, and, therefore, in most cases, the architect is not bound by pecuniary fetters, but has at his command ample means for the erection of an imposing building. It is somewhat strange that this emulation among Insurance Companies has not manifested itself in Manchester. The desire of excelling and of producing richly ornamented and handsome façades, fit to stand side by side with the magnificent warehouses which are scattered over the manufacturing metropolis, and which so totally eclipse the warehouses of any other town or city in England, is manifested in Manchester. The offices, however, at present occupied by the various Insurance Companies, are of the most common-place kind, and as designs they are unworthy of notice. In fact, nothing seems to have been attempted, and the majority of them are quite plain, and entirely destitute of any features of interest to an architect. Generally speaking, they do not form separate buildings in themselves, but are either a suit of rooms in a block of miscellaneous offices or chambers, or they occupy the first, second, or third floors over some of the principal shops; and, instead of trusting to the attractiveness of their architectural features, as in London and elsewhere, they seem to depend solely upon the magnitude of their sign boards with gigantic gilt letters, or on their wire blinds, rendered equally conspicuous. The situation, too, of some has been very ill selected, and instead of forming prominent objects to catch the eye of all, they are in many instances placed in back streets, unnoticed except by a few, and those few in all probability uninterested, and of the wrong class to swell their funds or increase their business connections. There is, perhaps, no city in which so great a number of Insurance Companies exist, or in which so many of their offices are to be found.

The Royal Insurance Company and the London and Liverpool Insurance Company have at last disturbed the lethargy which has prevailed so long in Manchester, and we do not doubt that the example they have set will speedily be followed by other companies in that city. Two imposing edifices in Upper King Street are rapidly approaching completion, and will, in a short time, be ready for occupation. They are situated very near to each other, and their relative merits may be readily compared. In the London and Liverpool Insurance Offices a classic design has been carried out, from the designs of Mr. Walters, the architect of the Free-Trade Hall, and a number of other large buildings in Manchester. And in the Royal Insurance Offices, Gothic has been adopted, the architect being Mr. Alfred Waterhouse, who, it will be remembered, was the successful competitor of the Assize Courts, which are now being carried out from his designs, and under his superintendence.

The building erected for the Liverpool and London is the larger of the two, and has considerably more frontage. It is three stories high, the upper one being more ornamental than the two lower. Originality does not appear to have been attempted, except in the balcony in the third story, where we find a design of a decidedly Gothic character,

and though ingenious and good, yet it does not seem to harmonise with the other portions of the façade. The first story is rather plain, but substantial in appearance; the windows are square-headed and without architraves or pediments. In the second story the windows have architraves carried round them, but no entablature. In the third story columns of polished granite are introduced. Festoons of carved flowers and fruit enrich the frieze of the upper entablatures, and a balustrade surmounts the whole. The walls are of light-coloured stone. The floors are fire-proof.

The Gothic design by Mr. Waterhouse is perhaps the best example of domestic Gothic in Manchester. The building is three stories high, with dormer windows above. There are two entrances, over which are small balconies. The windows are round-headed, but the hood moulds form a pointed arch, enclosing voussiers of different coloured stone—a light blue stone alternating with the light-coloured stone of the walling. The carving to the caps of the bold shafts in the first story is a little Byzantine in form and character, but nevertheless good. Polished granite shafts are introduced in the upper stories between the windows, in one story coupled and in the other used singly. The caps of these shafts are more nearly approaching the early English style, and are considerably smaller than those in the first story. The dormers are surmounted by storks, or birds of a similar kind, which form a very agreeable termination to the gables, and have an appearance of newness, which is decidedly an improvement on the conventional forms so generally placed there. The arches of the doorways are of very good design, and some of the details are original and pleasing. The carving throughout is well executed, and a considerable amount of thought seems to have been bestowed upon the designs. The lettering between the first and second stories appears to be the weakest portion, and wants distinctness; the carving around it is not sufficiently sunk. The words, "Royal Insurance Buildings," do not stand out boldly as they should in that position, and the foliage around the letters is rather spiritless. Taken, however, as a whole, the design is most satisfactory, and far in advance of most of the domestic Gothic which is generally produced. The cornice, chimney caps, strings, &c., are well treated, and the returns, or sides of the building, which appear above the adjoining houses, are built of brick, with broad stone bands, in such a manner as to be pleasing to the eye, though less costly and less ornamental than the front. This part is, in most of our modern works, entirely neglected, and frequently forms a disagreeable contrast to the better portions. The practice of throwing all the ornament into the elevation of an edifice facing a principal street, and leaving the other sides bare and unattractive, is one which all must condemn: yet so general is the fault, that it has become the rule rather than the exception, more particularly with those who do not understand their profession, or who look more to the five per cent. from their clients, than to the praise and admiration of a nation.

In Upper King Street can be seen some of the most interesting buildings in Manchester. First, the Town-hall, which is an example of the Grecian Ionic, well designed and well executed, and undoubtedly the purest classic edifice in Manchester. It was designed by Mr. Goodwin, and finished in 1825, at a cost of £40,000. The architecture of the Temple of Erechtheus, at Athens, has been closely followed, and the quiet grandeur of the whole cannot fail to excite admiration.

Nearly opposite the town-hall is the Branch Bank of England, a massive building designed by Professor Cockerell, and completed about the year 1846. The style is Doric, though not in its Grecian purity. The effect of the whole, however, is rather imposing, and is decidedly in character with the uses to which it is applied. The New Insurance Offices, of which we have spoken at length, added to these two important buildings, form a cluster of architectural works of great interest, not only on account of their size, but also as examples of the taste of some of the leading architects, at different periods, during the last forty years.

THE CHAPTER HOUSE, WESTMINSTER.

THE restoration of the Chapter House, Westminster, is of sufficient importance to justify our reverting to the subject this week. The present appearance of the Chapter House was, by Mr. Scott, aptly described as "something between a Methodist chapel and a warehouse." Its carved imageries have been shattered, its vaulted roof destroyed, its "twilight saints and dim emblazonings" are gone. Its windows are blocked up, and its wall-paintings almost obliterated; but eyes accustomed to the beauties of mediæval art, and minds which have pondered lovingly upon them, can recall the stolen graces, and recognise, although sadly, in those mutilated forms, art equal in purity to the best parts of the venerable Abbey. The form of a chapter house is fortunately such as to render its general restoration a matter of no great difficulty. The mouldings of the windows and of the vaulting, can here fortunately be accurately defined. The splendid pavement of encaustic tiles happily remains preserved beneath the

floor. The tracery of the stalls is sufficiently [discernible, and we have, in the appointment of Mr. Scott, the best guarantee for the fidelity and care with which every operation connected with its restoration will be performed.

It is quite plain, however, that nothing can be done without funds, and the question to be settled is, where are the funds to come from. In ordinary cases the reply would naturally be,—from the Dean and Chapter. But in this case we have to remember that the Chapter House does not really belong to the Chapter. It was in Edward III.'s reign made over to the House of Commons, and was used for the deliberations of its members until the reign of Edward VI. An interest quite distinct from its architectural merit is thus inseparably attached to it; one which ought to touch the hearts of those who would not willingly see the only remaining building associated with our early parliamentary history disappear. Moreover, one of the conditions of the loan was that the "Government should keep it in repair." To succeeding Governments its ruin is mainly owing. They have lopped its beauties to fit it for their requirements as a Record Office. They neglected to preserve anything connected with it except the dingy papers which filled it; and even now, when the records are more commodiously housed in Petter Lane, the Government retain possession of the building. To return it to the authorities of the Abbey in its present state would be a scandal and a disgrace to any ministry. To restore it as the Dean and Chapter have restored that portion of the Abbey entrusted to their keeping, would be but a simple fulfilment of the original condition connected with its transfer. In former times the undertaking would have been easily accomplished. A pious old monk, "a man of great sanctity and simplicity of manners," would have had only to dream—which they could do at a day's notice—that Peter, or Paul, or some other favourite saint, had pointed out this work as peculiarly worthy of the king's goodness. "There is a place of mine in the west part [of London, which I chose and love, and which I formerly consecrated with my own hands, honoured with my presence, and consecrated with my miracles. The name of the place is Thorney; which, having for the sins of the people been given to the power of the barbarians, from rich is become poor, from stately, low, and from honourable, is made despicable. This let the king by my command restore." With such a dream Walsine persuaded Edward the Confessor to devote [his] entire energies to the building. We live in different times. Monks will not see convenient visions, and kings would not be credulous even if they did. The pious zeal which did not scorn a lie, when it served the Church's purposes, is unknown to our ecclesiastics. They can only appeal to public opinion, and the appeal of the Dean and Chapter of Westminster is in this case backed by their own useful labours. They can point to their own restorations when they ask the Government to put the Chapter House in harmony with them. They make no claim for the building itself; they only demand the restoration of its beauties. They are not moved by any petty desire to sit in solemn conclave in their ancient house, but they wish to point out to Englishmen that one of their noblest architectural monuments, filled with associations of the highest interest, is rent and torn, and wasting silently away. The building "has become," as the Bishop of Oxford said, "by long usage the property of the nation." Even in its desolation it has preserved the nation's records, and deserves on that account alone some consideration at the nation's hands. Twenty thousand pounds—the cost of a complimentary embassy to attend a foreign monarch's marriage which no one cares three straws about—would defray the whole bill. A fraction of even that sum at the head of a subscription list, would attract contributions from other influential and wealthy quarters, and ensure the accomplishment of the work. Mr. Hope put the matter in its true light when he said, "it was the Government who had originally destroyed and mutilated the building, and he did not see any reason why they should not be called upon to put the place in good tenable repair."

It is somewhat humiliating to know and to be told that such a scandal could not exist in France, that the Emperor would at once, of his own will, order its restoration, and especially so, when we reflect that our Commons' House, whose former connection with the Chapter House we seek to perpetuate, is the very power which, by its proud privilege of holding the national purse, prevents our doing so. A constitutional government may, as in this case, cause us a little inconvenience, but we can afford to suffer it. If the Government will not do the work, we have, in England, the liberty to do it ourselves; and this is just what we would have the public make up its mind to. Our faith in parliamentary sacrifice to art and tradition is not great. Our confidence in the architectural taste of Lord Palmerston and of Mr. Cowper is still less. Mr. Gladstone, with the best wishes, perhaps, in the world, would, we fancy, instinctively clutch the national money-bag, and plead poverty in a clever speech. From the Government we expect but little, if anything; and if the subject should be brought before Parliament, it would, we fancy, stir up all

the loud speaking ignorance in it. Every member desirous of shining as an economist, and of atoning for his indifference when a large grant stalked boldly past him, would open his mouth to smite the small sum. Small wits would throw their little pellets at the church. The dissenting members would be raked together by some metropolitan representative, and the proposal to do an act of simple justice and to preserve a national monument would be altogether obscured by the vast array of economical champions. We would therefore remind the committee of the Persian proverb, "to expect nothing, and thus escape disappointment:" to rely upon their own energies in awakening an interest in the venerable ruin; and if they cannot get the building restored by the Government, to obtain it unrestored from them.

The circumstance of the Chapter House—a Government building, be it remembered, lately the Record Office—becoming year after year more and more dilapidated, without a shilling being expended to stay the ravages of time, or to preserve—except accidentally, as with the boarded floor—its many beauties, strengthens our conviction that there ought to be in England a Minister of Public Works, who should be not only responsible for the expenditure of the money voted specially by Parliament, but under whose charge the conservation of really national monuments should be placed. A small sum annually voted would enable him to assist occasionally in the preservation of many interesting relics of our old English architecture. For the want of such assistance, much has already been for ever lost to us, and more has been injudiciously restored, and thus fatally ruined. In the hands of Mr. Gilbert Scott, the Chapter House, and all connected with it, will, we know, be tenderly cared for. We sincerely hope that a sufficiency of funds will second his exertions.

INTERNATIONAL EXHIBITION.

THE PICTURE GALLERIES.

THE pictures by Turner in the International Exhibition are very inadequate to give a satisfactory idea of his varied and extraordinary powers as a painter. It is true that the objection may be met by referring the visitor to the South Kensington Museum close by, or to the Turner Gallery in Trafalgar Square, but neither of the three collections separately, nor, indeed, were they brought together in one, would enable the general public and our foreign visitors to either appreciate Turner's peculiar talents, nor the bearing the gradual development of his wonderful genius ought to have upon the practice of progressive art. The selection of the pictures by him in the present Exhibition may have been guided, as we have said in our preceding article, by the desire not to confuse the unlearned by placing before them curiosities or eccentricities in painting, but our objection to the pictures which have been selected, is that they do not represent, beyond the mere classic style of composition, any distinct period of Turner's brilliant career; besides which these pictures are either so dirty or low in tone, as not to suggest even his extraordinary mode of depicting distance and atmosphere. It was well, no doubt, to avoid as far as possible renewing the impression that the works of Turner are to be judged only as incomprehensible daubs, and he, himself, as if he were a wonderful being, who had suddenly descended from the clouds well stocked with all sorts of fiery colours, which he smeared upon canvass for his own satisfaction, in a manner that no rational person could understand, and which it was very doubtful whether he could understand himself. The only way under these circumstances, to do him justice for good and rational intentions, whatever may have been his success in carrying them out, is to trace him, as regards his practice, from his earliest time. Turner commenced in the good period of English art, when the old masters were respected, and the principles laid down by Sir Joshua Reynolds were duly appreciated. The earliest efforts of Turner, when he had attracted notice, were like those of his contemporaries in water-colours, merely tinted drawings; the attempt to equal the force and power of oil-colour had not then been made. Many of his views were executed on coloured paper, the sky being represented by a little blue, the middle distance left with very little more than the general colour of the paper, and the foreground rather sharply accented with a touch or two of warm local tint. The effect thus produced would, at the present time, be considered poor and washy, but good judges would in all such works discover the indication of a great mind. If he sketched only a piece of rock with some water near it, and a bank for a foreground, there was always a broad massiveness, with a unity of treatment, that could not be passed without admiration. In course of time water-colour drawings made a nearer approach to oil pictures, and in the new practice Turner led the way, and continued at the head of the movement, until, finding that water-colours were too feeble to express his growing and lofty conceptions, he boldly took up the palette, without previous practice, and, although laughed at in the beginning, he soon became established as a leading painter in oils. From that time his wants increased with the development of his genius, and from what we see, it is but fair to assume, where he fails, or at least, where we fail to understand him, that known pigments were incapable of expressing his conceptions. Our purpose in giving this description of Turner's progress in art, is to suggest that the most incomprehensible of his works were the result of a steady progress, that is, from the most simple method employed by himself and his contemporaries in art, advancing to a

brilliant and gorgeous display of colours, in which he left all competitors behind; but as his progress was so gradually progressive, may he not in his most daring flights, be perfectly rational to his highly cultivated perceptions, and may not the irrationality be with ourselves, in consequence of our own powers being neither so sensitively formed by nature, nor so highly cultivated by practice and study as his were? A broken twig will show an Indian hunter his way through the bush where, for want of the keen eye that detects it, the European traveller would lose himself and perish. So it is with some of Turner's pictures, and therefore they should be respectfully studied with the hope of finding the clue to the labyrinth, and not passed contemptuously by, as the wanderings of a madman, for, as we have suggested, it may be doubtful which of the two is entitled to the unenviable distinction—the painter or the spectator: at all events Turner was perfectly sane when he made his will and bequeathed his "Carthage" to the nation, on condition that it should be hung by the best Claude in the National Gallery. The Trustees need not have had it cruelly skinned by the picture cleaner to give Turner an advantage, because his superiority in every respect is apparent, we should think, to the least cultivated eye. In short, the pictures in the National Gallery, at the South Kensington Museum, and his water-colour drawings, not his oil pictures, at the International Exhibition, place him far above every other landscape painter that ever lived, in the ordinary sense of the term, and as a painter of ideal or mythological subjects connected with landscape, there is no other name, except Wilson, perhaps, that ought to be mentioned as a competitor in that branch of subject. Like Michael Angelo, Turner was a giant in art, and moderate geniuses become pigmies by comparison, the moment they are so rash as to remind us of either of them.

Mulready, although somewhat spoiled by an affected tone of colour—some of his figures appear nearly red-hot—is an artist of whom Englishmen may be proud, whether his figures or his landscape backgrounds be considered; besides which, as may be seen in the present Exhibition, he draws the nude with remarkable delicacy, grace, and purity. "Train up a Child" is really admirable, particularly in the tone and treatment of the group of grim-looking beggars, which, by the way, was no doubt the original of his fine picture, now at the Royal Academy, of the negro offering to sell a toy to a child that turns away alarmed. Leslie, in attempting breadth and simplicity of colouring, too often produces a boldness of rendering, which is not pleasant, but in this respect he may compare with Willems, the Belgian painter of the same class of subjects, although he never rises to story-telling. We think Leslie's "Playing at Horses" is a remarkably happy idea. In order to judge of Barry, the visitor should be referred to his paintings in the great room of the Society of Arts, for his "Adam and Eve" in the International Exhibition is a very feeble production, and, as a historical painter, the less said about West perhaps the better. He drew with firmness and vigour, composed with skill and learning, but his colouring has no sympathy with his subject; his heads are all individual and common-place, and consequently are destitute of the elevated character and expressive dignity essential to Scriptural subjects. De Loutherbourg, who was scene-painter to Garrick, had a fine perception of the muscular flexibility and bony development peculiar to the British seaman of his day. Hence, while his sea-fights are theatrically grand in their volumes of smoke, clouds of bellying canvas, and vivid explosions, if there was a boat's crew landing troops, or sailors clinging to floating spars, they have a breadth of bearing and a recklessness of manner that no other painter ever so completely realised as the manly characteristics of the tars of old, and who won our great naval victories.

Stothard, the prince of designers, as he was called in his day, may perhaps defy competition among our foreign exhibitors for the fanciful treatment of his subjects, the facility with which he groups his figures, and not unfrequently the rich harmony of his colouring. The amiability, if we may be allowed the expression, of his drawing is injured in some degree by its want of vigour in the general forms, and precision in the marking of the joints. He is slovenly sometimes, which arose no doubt from rapid designing for booksellers, and the excellence of the engravers at that time, who could produce a very excellent plate from a very slight drawing. Stothard possessed an elegant fancy, which he exercised in his sketch-books by idealising persons he saw in the streets, as a fishwoman with a basket on her head, and such humble subjects; but this practice was not conducive to the matter-of-fact exactitude required at the present day, and therefore the peculiar excellence of Stothard is not likely to elicit much approbation; but his contemporaries collected his designs as fast as they were published, and we are no doubt often pleased with the effect without thinking of the cause.

The fame of Wilkie is fortunately preserved by the selecting such subjects as present him in his best style to the public. His admirable picture of the "Village Festival" stands unrivalled by any work in the foreign galleries, for its joyous fun and robust hilarity. Wilkie was formed on the Dutch masters, whom, in the early part of his career, he not only copied, but imitated for a living, and the legitimate use he made of the experience he acquired in that occupation, may be judged by the excellent subjects he produced, so entirely English, that no trace of the Dutch origin can be traced. It may fairly be doubted whether his visit to Spain, and consequent change of style, will not prove more injurious than beneficial to his reputation as a painter. He certainly painted with more force obtained by powerful contrasts of light and shade, than before he quitted England; but the tone of colour and want of drawing, especially in his large whole-length portraits, which he painted on his return, and became the fashion, show that humble subjects were much better suited to his talents. In them his drawing was all that could be required, but in his "Alfred in the Goatherd's Cottage"

he had displayed his deficiency for the historical composition; and in his Spanish subjects, when he attempted the masterly style instead of his former feebleness, he only substituted the wooden for the puerile. The finest of his pictures painted in the Spanish style is the "Beadle taking the Monkey-Boy to Prison," which has been extremely well copied as a miniature on an unusually large piece of ivory, to be seen in the large room of the foreign division. When we say the Spanish school, we allude to the art in the time of Murillo or Velasquez, for it is a remarkable fact that not one of the pictures by living artists in Spain sent to the present exhibition has the slightest resemblance to the style and tone of that early school, transplanted by Wilkie, and still cultivated by Hurlston, but on the contrary, they are assimilated to the modern mode of painting now prevailing amongst ourselves, and which seems to be the point to which all schools are directing their energies—namely the perfection of realistic resemblance. Looking at the tendency of pictorial art generally, with its matter-of-fact application at the present moment, we think it may be safely predicted, that those who live to see a similar collection of pictures to that now in the International Exhibition, at the end of another ten or eleven years, will find, as hero-worship is evidently on the decrease, political animosities dying away, and national convulsions becoming less frequent, that the higher style of art will yield to portraiture, domestic scenes, and landscape, and, unless an extraordinary genius should disturb the equanimity of the pictorial mind, that the picture displays on canvas of each nation will so nearly approach each other in style, subject, and treatment, that future critics will find little diversity upon which to exercise their acumen. We may, in support of this opinion, direct attention to the circumstance, that while foreigners are complaining that the English paint no historical pictures—with the exception of the French battle-pieces—the Belgians, who take the lead in the higher branch of art, have no picture in the International Exhibition more recent than the events which followed the abdication of Charles V. of Spain.

Returning for a moment to the works of Wilkie, we think, on such subjects as the "Village Festival," "Blind Man's Buff," and similar productions by which he obtained his fame, he stands unrivalled in the extent of his composition, the skill with which it was conducted, and the hearty homeliness of the prevailing sentiment, and in all of which it is well known that every figure was carefully studied from living models; but, with a few exceptions, those pictures painted in his Spanish manner will rather injure than increase his future fame.

ARCHITECTURAL ASSOCIATION.—MR. R. P. SPIERS ON ARCHITECTURE IN NORMANDY.

(Continued from our last.)

MR. SPIERS proceeded to say that he made Bayeux his starting-point for two short excursions to the small villages which lie north of it, and it is to the northern part of the Calvados the tourist should direct his steps in search of simple Norman churches. The country is comparatively flat, and the small spires or towers serve as guiding landmarks to the route. On his first visit he left Bayeux by the north-west, in a diligence, stopping at Maisons, five miles distant. After a walk of four additional miles, he arrived at Etroham, where there is a pretty little church, with a tower finely proportioned, and of the thirteenth century; but only the western façade of the original Norman church remains. At Villy there are the ruins of a small church; and Huppain has an interesting western front, and is curious for having small arcades interlaced, forming a pointed arch by their intersection; this decoration which is on the tower is very interesting, the latter being probably of the ninth century. Colleville-sur-Mer possesses a very pretty and most remarkable Norman tower; it is composed of six stories, of which the highest is pierced on each face with circular openings, a feature which very rarely occurs. The spire is of later date, and the nave and choir are of the twelfth century. Vierville has a very elegant tower and spire of the fourteenth century; the church had formerly side aisles, and was more important than it is at present. Formigny has a tower of the thirteenth century, with a double-gabled roof—a form which, in his opinion, was rarely met with in England. The tourist was reminded, when visiting this village, by a large inscription on a public monument, that it was here the English sustained a great defeat, in 1450, the consequences of which obliged them ultimately to give up Normandy, which they had held since 1417. Caumont remarks, in his "Researches in Normandy," that the church here, as also those at Belleville and St. Laintant, has a side aisle on the north only. Louvières has a spire and tower somewhat resembling those at Vierville, but having no circular tower at the corner. The nave is of the Norman style, and the spire, which is a lofty structure, is seen for miles around. Asnières possesses a tower and spire of a somewhat similar character, but more pleasing in proportion. It was formerly a Norman church; but being *restored*, a doorway is the only feature of that style which remains. The church of Englesqueville is in the Transition style of the twelfth and thirteenth centuries; the choir retains its primitive windows, but the southern wall has been rebuilt. The tower is a curious building, possessing, like that at Colleville, circular windows. The chapel at Jucoville, near Lacambe, is of the fifteenth century, and possesses some beautiful carving. The lecturer proceeded to say that he then returned by rail to Bayeux. In his second trip he left by the north-east corner of Bayeux, passing by St. Vigor, where there is a fine old abbey-gateway. At Vienne is a charming church, partly belonging to the thirteenth century; the southern façade has a rich doorway; and the tower, situated on the east, consists of four stories, the uppermost of which has a circular arch

pierced with two windows. The choir is of the thirteenth or fourteenth century. Villiers-le-Sec has a fine rectangular tower, with a staircase-tower, also rectangular, at the south-west corner, of the thirteenth century, and the choir belongs to the same period. The rest of the church is modern, and presents no feature of beauty. Tiroville has a church, with an ancient Norman doorway; the tower is of the fourteenth or fifteenth century. Bazenville, which is close to the last-mentioned structure, Mr. Spiers did not visit; but Caumont says it possesses the best-proportioned tower in the district, and is principally of the thirteenth century. The Château of Crevilly is exceedingly interesting, and very picturesque; and Caumont says it is one of the most strongly fortified châteaux in Normandy. The whole of the ground-floor, which is of the twelfth century, is vaulted with circular ribs; the rooms are very low, and serve for vestibules and cellars. The upper parts of the building are of the fourteenth and fifteenth centuries, and the façade of the sixteenth. The ancient moat has been filled up, and a garden planted in its place. The portcullis and remains of a drawbridge blocked up, may be seen at the building. Breey has a fine entrance-gateway, of the sixteenth century; but the old château exists no longer. St. Gabrielle has an interesting Norman chapel, of the eleventh century, now under the care of the French Archaeological Society; here are also an ancient priory, of the fourteenth or fifteenth century, and a tower, nearly in ruins. The gateway of the priory, and other portions of the building, have been converted to the uses of a farmyard. The lecturer, in continuation, said he visited Esquay, where there is a small church, partly of the thirteenth century, the tower and spire having been lately added. There is a fine château, of the seventeenth century, but he had not an opportunity of visiting it. Most of the villages above referred to are about four miles distant one from another. The women living in them are chiefly occupied in the lace manufacture, for which they receive but poor remuneration, a good workwoman being paid not more than a franc a day. From Bayeux Mr. Spiers said he proceeded direct to Cherbourg, the entrance to which is extremely beautiful—its hills, railway, towers, fort, trees, harbour, and shipping forming a pretty picture. He visited the port, where he saw much that is interesting in naval architecture; and inspected the museum, which contains plans of Cherbourg, as it was ten years ago, and as it is now. Leaving Cherbourg, he proceeded to visit other places, amongst them Carentan, which has a very fine church; unfortunately the nave and towers are very low, or it would be one of the finest structures in this district. St. Lo is an attractive town; the principal part of it is built on an eminence, the cliff rising almost perpendicularly by the side of a broad canal. It was formerly fortified, and most of the ancient walls remain. The Hotel de Ville, an edifice of modern construction, tells well its destination. The large church of Notre Dame has a fine façade, with two towers, but presents some curious irregularities, said to have been intended by the architect. The structure dates from the fourteenth century, the two towers are not alike, and what is called the central doorway is not in the centre. The tower on the right has a pointed arch, that on the left a circular one, though not Norman. There are constructional arches turned over the windows above the entrance doorways, which are dissimilar and of different widths. In the interior no two walls are parallel, and the choir is not in the same axis as the nave. There are some singular arrangements of the chapels round the choir. The most beautiful feature of the building is an exterior stone pulpit, with canopy of the thirteenth century; he believed there was only one other of or previous to that period existing in France. There were not many in England, he thought; he knew only of one, which was at Magdalen College, Oxford. The Church of St. Croix, of the twelfth century, which is now undergoing a complete restoration, is, or at least was, a very interesting structure, presenting a complete, though small beautiful Norman erection, with capitals. It formerly had a nave and two aisles, with circular rib vaulting, and a small circular chancel. The church not having been sufficiently large, was placed, for alterations, under the care of an architect, who has pulled down the chancel, added another division to those remaining of the nave, and put an additional side aisle, with a tower in the centre of the south façade, making a kind of façade of his own. The old part of the church has been heightened, by removing a vault, adding a triforium, and doubling the height of the original clerestory. By the side of this church are the imperial stables of St. Lo, kept up by the French Government for the improvement of the breed of cavalry horses, and preserving the Norman horse. Here he found about a hundred animals, including a few fine Arabians, and six or seven English race horses. There is a well-constructed roof in the manege or riding-school. At St.

are to Lobefound several very fine old wooden houses, two of which, situated near the cathedral, and of the fifteenth century, are in an excellent state of preservation.

There being no railway south of St. Lo, he took the diligence and proceeded to Coutances, the cathedral of which, of the thirteenth century, is remarkably interesting, and is perhaps the only cathedral in France which preserves the same style throughout, having been commenced and finished by the same architect, and within a period of about eighteen years. The style is Early English: he said Early English advisedly, for it quite differs from other French cathedrals, except perhaps of Bayeux, and resembles our own English examples. It possesses two towers and spires on the façade, and a large central tower, which, as Mr. Ferguson, in his Hand-Book remarks, "requires only the crowning spire to make this group of towers equal to anything on this side of the Channel." The effect of the interior of this tower is very striking from the nave. The exterior of the choir, as seen from the Bishop's palace garden is insipid, like the choir of Bayeux. There is another church, St. Pierre, which, like the cathedral, has a central tower at the intersection of the nave and transepts, and is a unique example of a central tower of the sixteenth century (Italian Romanesque), at least for its size and beauty. There is only one tower on the façade of this church, and it is of the fifteenth century. St. Nicolas is a singular church, in which he was mistaken as to date. He had put it down as a thirteenth century building, and a beautiful specimen of its class, but an architect of the town assured him it was built in the last century, a statement on which he did not place implicit reliance, however, for the structure had renaissance pendants in the aisle round the choir, which seems to be of the sixteenth century. There are some beautiful encaustic tiles, in perfect preservation in the chapter house of the cathedral. The town itself possesses no other architectural curiosities, the houses being for the most part built in plaster. The stone of which the cathedral was built came from Caen. There are many picturesque views from the town, which is built on an eminence. From Coutances he returned to St. Lo, and thence went on to Caen; stopping, however, on the road, to visit Bretteville and one or two other villages on the route. Bretteville church has a choir of the thirteenth, and a tower of the fourteenth century. Norrey possesses a most interesting and very rich village church; it has a simple nave, transept, with chapels annexed, and a choir, with side aisles and two chapels attached. On the north side is a very elegant porch of the thirteenth century, and the nave is of the early period of the same century. The sculpture in the interior round the side aisles is extremely beautiful, and a good type of the fourteenth century. The pointed arches separating the choir from the side aisles are carried on twin circular columns. There exist in the building two stone altars, the tables resting on a solid triangular block, and the corners being supported by small columns. He next visited Cheux, the choir, transept, and chapels of which are of pure Norman, and the choir is decorated with arcades. The church at Moven dates from the twelfth century; the exterior walls are decorated at a height of eight feet from the ground, with blank arcades continued all round the building, which has a fine western doorway.

(To be concluded in our next.)

COMBINED MACHINE FOR PLANING, TONGUEING, &c.

MESSRS. Powis, James, and Co., exhibit in Class VII. in the western annexe of the International Exhibition, a combined machine for planing, edging, tongueing, grooving, thicknessing, and moulding. The

machine operates upon all four sides at one time, and although so simple in construction, it will do all the work that any ordinary planing machine can do: likewise, having a variable feed, it is well adapted for every class of moulding, large and small. The manner in which the pressure is applied to the feed rollers, gives a great facility when changes are required, to suit the various classes of work. This machine is capable of doing from the deck plank to the most delicate moulding. The cutter heads being all forged solid on the spindle, there is no fear of their flying off, and at one glance it may be seen that free access is given to all working parts. The machine will take in 12 by 5.

MR. G. A. SALA ON THE INTERNATIONAL EXHIBITION BUILDING.

AT the recent meeting of the Society of Arts, when Mr. Hawes read his excellent paper "On the International Exhibition of 1862," Mr. G. A. SALA said, as one of the public, he might be allowed to say a few words on an essentially public question. With regard to the contents of the Exhibition, he had viewed them with satisfaction, wonder, and admiration, but with respect to the building, he might, as one who had given some attention to art, say a few words. Mr. Nelson had characterised the building as a national disgrace; he (Mr. Sala) did not consider it a national disgrace, but a national mistake, and for this reason: It would be in their recollection that in 1851, all eminent men as architects and designers were called upon to send in plans for the Great Exhibition, and they all recoiled at what hideous, monstrous, and abnormal designs were sent in on that occasion, and he remembered how his eyes were horrified by some of these designs. Those designs were mediocre, common-place, every-day things; but it occurred to Sir Joseph Paxton, by what he would term an inspiration of genius, to send in the design of the Crystal Palace of 1851. He repeated, that was an inspiration of genius, and that design threw far into the shade every other architectural plan submitted to the commissioners; but it was due to the architects of the country to state that whilst the design of Sir Joseph Paxton was a marvellous combination of iron and glass, it was common-place in its form, and, as originally conceived, presented a resemblance to three packing-cases piled one upon the other, until the late Sir Charles Barry added the transept, and that addition made it the beautiful thing it was. As regarded the Exhibition building of 1862, he considered that various errors had been committed. The building was certainly not magnificent; indeed, in his opinion, it might almost be called hideous. The picture galleries certainly were light, commodious, and spacious; and albeit he agreed with Mr. Nelson that there was a want of smaller adjacent apartments, in which the cabinet gems could be displayed with advantage, instead of being lost amongst the mass of larger pictures, he must say the picture galleries of the Exhibition were amongst the grandest and most satisfactory features of that otherwise most unsatisfactory building. But in this the error was committed. They did not expect perfection in the building, but they did expect a building which would equal, if it did not surpass, that of Sir Joseph Paxton. But did they go to work the right way to get a building which should either rival or equal the former one? Were the most eminent architects of the day consulted as to the building? As one of the public he was taken by surprise—not at the announcement that another Exhibition building was wanting—but that Captain Fowke had been appointed to construct it. If ever there was a deed done in a corner, it seemed to him to be that which was done by the Royal Commissioners, or by some one, he did not know who, some mysterious body, some conclave sitting in an underground building, meeting together, wrapped in robes of mystery, who said, "Fowke, and Fowke only, is the man." But he might be allowed, whilst decidedly expressing, as he believed, the opinion of a not wholly uninfluential section of the public, that the present building was an infringement of all the canons of good taste, to say that he did not think Captain Fowke was so much to be blamed for what he had done. What more could he do? He was doubtless an able officer of the Royal Engineers; but did the Society of Arts, a hundred years ago, ask an officer of Engineers to paint the pictures in that room? If Barry had been Barry, R.E., instead of Barry, R.A., would he have been asked to paint these pictures, representing the progress of the arts and sciences? That mysterious council which he had referred to, be thought themselves that a Royal Engineer officer was an artist: they were led away by sundry sketches by Captain Fowke—probably prepared at Woolwich—for turning the National Gallery inside out—and that body fixed upon him. Hence this great national mistake—not, however, a national disgrace. That might be repaired by the speedy demolition of the building, after the purposes for which it was unfortunately erected had been served, or else by its conversion to some other useful commercial purpose. He would conclude these few remarks by expressing his admiration of the contents of the Exhibition. His opinion was that the contents of that Exhibition were not a national disgrace, but a national honour, and likely to conduce to the prosperity, the glory, and the honour of England.

INTERNATIONAL EXHIBITION.

NOVELTIES FROM COAL, IN GAS AND LIGHT.

NOVELTY! where does it really exist? Egyptian children, three thousand years ago, amused themselves with marbles and balls. The ancients utilised gold, iron, &c., and, in the instance of copper, hardened it for tools to equal our steel, an art now unknown. The turning to account

coal and its products, particularly illuminating gas, has been left to this era. Within the crust of the earth there may be stored up another wonderful formation, the uses of which will be only unfolded to a future period and condition of mankind.

The twenty years elapsing between the first and next International Exhibition probably covers a period during which there will occur three changes in the raw material for making paraffine. In 1851, the paraffine candle exhibited was made from turf. The considerable display now shown by Mr. Young, Class II., Messrs. J. C. and J. Field, Class VI., and others, of blocks of paraffine produced entirely from coal tar, prove a considerable manufacture has been developed during the past ten years. In 1871, it is probable neither turf nor coal tar will be used for making paraffine, but instead, the lately introduced petroleum, or rock oil.

On the completion of the late French treaty, the trade of Coventry was paralysed by every one appreciating the brilliancy and durability of foreign dyed silk ribbons. The many dazzling colours, now so universally admired, extracted from coal tar, on view in Class II., No. 600, &c., effectually remove doubt respecting the future splendour of British dyes; they can be equalled, but not surpassed.

For some years past steel has been superseding whalebone, once so much used, now almost forgotten. Another change has commenced: the lately introduced rock oil of Canada, as well as coal tar—both of which can be manufactured to supply all oils hitherto obtained from the sperm whale, the oleaginous linseed, and the volatile oil of the pine. The lubricating grease made from coal-tar does not become easily rancid, and is more unctuous when in contact with metals than that made from animals. Within the cases of Mr. D. Dawson, and others, Classes I. and II., can be seen naphtha for melting india-rubber, &c.; benzole, that will cause oil paint to dry as quickly as lime-wash; lamp oil, &c., manufactured from Wigan and Boghead Cannels, also from Newcastle coal.

Before the battle of Trafalgar, oil lamps lighted the streets of towns at night throughout Europe. The comparative recentness of the introduction of gas illumination allows full scope for originality. Changing to Class XIII., No. 2,973, Mr. Sugg's case contains a photometer, eudiometer, exhauster, alarum, &c. The photometer is an apparatus first invented by Count Rumford, for comparing the lighting power of gases with candles, by placing a five-foot gas argand light and a burning candle in the separate compartments of a box with a division; all the inside of the box being blackened, excepting one end, which is to be white. The power of the respective lights can be noticed on the white side, by drawing the gas-burner gradually away, until the appearance of the shadows on it of both lights are uniform. The simple law of light shows that the brilliancy produced by the burning candle and gas is proportionate to the square of their respective distances from the white side of the box. The late Baron Bunsen also invented a photometer, using a piece of white transparent cloth, with an opaque centre, the candle and gas lights being placed on each side. When the appearance of the opaque part of the cloth is similar on both sides, then the difference of the distance of the gas burner and candle from the cloth will give the relative power of their lights. The patent photometer exhibited seems to be that of employing the inventions of Count Rumford and Baron Bunsen in a combined shape. The eudiometer is an instrument for obtaining, by means of bromine, sulphate of copper, and caustic potash, the volumes of hydrocarbon vapours, sulphuretted hydrogen, and carbonic acid impregnating coal gases.

Mr. Sugg also exhibits an exhauster gauge and an alarum. The exhauster acts in the manner of a water force-pump, and the pressure of gas on the retorts is shown on a principle something analogous to the common barometer. Only water is used, which is forced up or drawn down a tube in accordance with the degree of pressure of the gas on water in a case, to which the tube forms a funnel. The rising or falling of the water in the tube is shown by means of a float on a dial.

The unsatisfactory character of the measures formerly in use for the sale of gas, drew the attention of the Legislature to the subject, and caused the passing of the "Sales of Gas Act." Formerly a variation from the true measure, reaching often as high as from 30 to 40 per cent., occurred. The Act referred to limits the range of error in gas meters to 2 per cent. as against the consumer, and 3 per cent. as against the gas manufacturer. In providing an instrument by which the intentions of the Legislature, so far as the testing of meters is concerned, can be carried out, Mr. Glover has conferred a valuable boon alike on gas companies and on the community. In the "Gas Consumers' Manual," which has just appeared, the national standard gas measures are characterised by the Astronomer Royal as capable of being applied to the verification of gas meters of every class, and as accurate as it is possible for human skill to make them. They have now been in use at the "Exchequer" above a year, and found perfectly adapted to their purpose. Messrs. G. Glover and Co. also exhibit a meter adapted for the photometer, remarkable for its simplicity and accuracy. By this meter quantities of gas so minute as from $\frac{1}{100}$ to $\frac{1}{2000}$ part of a cubic foot can be measured each second with precision.

The national standard gas measurer consists of an oval formed brass bottle, capable of holding exactly five cubic feet of gas; when full, the gas is emitted into the meter to be tested by displacing the gas in the bottle with water. The arrangements skilfully devised for performing this simple operation by Mr. G. Glover, are one of the objects well worthy of careful inspection at the Exhibition. Another interesting stall, Mr. Richards', Class XXXI., No. 6,342, contains the first gas dry meter, as manufactured by the Dry Meter Company, in 1835-6. The cylinder or case of this meter is divided by a loose piece of leather, acting as a diaphragm, its

use being to separate the measured from the unmeasured gas. The measured gas is expelled from one side of the leather by the entrance of the unmeasured gas, which distends the leather from the opposite side. When the leather is distended to its limits, the valve changes, indicating at the same time. The reverse action then occurs, and the gas in the filled compartment is expelled by the gas entering the empty one. This is the principle of all dry meters. The dry meter company ceased to exist after losing nearly £100,000. The first successful dry meter is that patented by M. Defries and N. F. Taylor in 1843. Mr. Richards also exhibits his own gas dry meter, and one invented by him in 1844. The description of meter here shown is that made by many of the dry meter manufacturers in the United Kingdom, the production annually being nearly 80,000.

(To be continued in our next.)

LABOURERS' COTTAGES, AND THEIR BEARING UPON ARCHITECTURE.

ON Tuesday evening a lecture was delivered in the theatre of South Kensington Museum, before the members and friends of the Architectural Museum, by the Rev. THOMAS JAMES, M.A., "ON LABOURERS' COTTAGES AND THEIR BEARING UPON ARCHITECTURE." The chair was occupied by the President of the Architectural Museum, Mr. A. J. B. BERESFORD-HOPE, who briefly introduced the lecturer.

The Rev. LECTURER said:—The lodging of our working classes in London and in the great cities is indeed a pressing question, but it is one still more removed from the sphere of art into that of social science, than the one which I have adopted; and so long as our wealthy Londoners care to remain contented with such high art as the 3-windowed houses of Harley Street and its compeers afford, it would indeed be preposterous to think of applying any sense of the term architecture, to the buildings destined for workmen and artisans. It is some hope, perhaps, for the miserably degraded condition of the domestic street architecture of London, that the best recent examples of urban building have been in city warehouses and St. Giles' Schools. Beginning at this end, it may surely in time force its way upwards, and shame our middle and higher classes, with their two or ten thousand a year, from burying themselves in the dingy walls of pointed brick, broken only by those statutable openings for limited light—which can only be explained to the intelligent foreigners, now so thickly congregating among us, as the nation's grateful memorial and perpetual tribute to the memory of the deceased Window Tax.

But while the difficulty of attaining good street architecture seems, judging from its rarity, almost insuperable, everybody supposes that he could build a Cottage. Just as everyone thinks he can write for the poor, so everyone thinks he can build for the poor; so little is required—so few the wants. You have only to take pen or pencil in hand, and the thing is done! But, indeed, the poor man's authors, after his Bible, are but three or four, and they of the very best; and of the thousand cottage plans that have been designed for the country labourer, there are scarcely more than three or four which he really likes, or would care to live in. It is notorious that the old mud hovels of the waste, the concretion of many generations, have far more comforts and charms, for the peasant, than most of the new spick and span new model cottages, premiated at the last agricultural show.

It would be a waste of time, yet almost amusing, to run over the marvellous mistakes which have been made in prize cottages, even by our leading societies. Some of the very worst models which I know have been ushered into the world as model designs. Some without any pantry—one with an ornamental verandah over the scullery—another with separate chimney shaft to nearly every grate—another with classical pediment to the gable, and Gothic moulded battlements to the pigsty. I pass over the outrageous bargeboards and extravagant hipknobs and other absurdities, added with the idea of giving an architectural character, and some quite impracticable; and I must own myself to a share in one which appeared in a leading review, in which the only way upstairs was apparently through the window.

Till within the last twenty years very little thought was given to cottage-building. Even improving landlords had little notion except of making them picturesque. The Lady Bountifuls, fresh from the side scenes of a London opera, tacked on, by the aid of the village carpenter, barge boards and rough bark, put sham latches on the front doors, which were nailed up to make all look neat and tidy, and then believed that they had effected a Swiss cottage, and a creditable improvement. But this was all in reference to themselves, and not to the occupiers, who were often put to great inconvenience for the sake of this outside show. Even when the best motives actuated the proprietors, there was a lamentable want of proper adaptation to the end proposed; and I scarcely know an instance where extensive cottage-building was effected, five-and-twenty years ago, where there are not evidences, in pseudo-Gothic, and classic accessories, of an unreality about the work, and, at best, but a feeling after an object which was not attained. The late Duke of Bedford was one of the first who systematically set to work in a practical spirit to solve the problem how a substantial and convenient house could be erected for the labourer, at a cost which would pay a reasonable interest on the outlay. He took the broad and liberal view which became a man who recognised the principle, that property has its duties as well as its rights. "Cottage-building," he says, "is, we all know, a bad investment of money, but this is not the light in which such a subject should be viewed by landlords, from whom it is surely not too much

to expect, that while they are building and improving farmhouses, home-steads, and cattle-sheds, they will also build and improve the dwellings of their labourers, in sufficient number to meet the improved and improving condition of the land."

His example was very widely and quickly followed; and indeed there were many other landlords, of greater or less acreage, doing the same good work independently, at the same time; but the Duke of Bedford will always stand out conspicuous in the movement, from the personal attention he himself bestowed upon the details of the plans, and from the book of designs that he published.

These are still among the very best before the public, and greatly to be preferred to the majority of those put out by professional architects. They range from a single cottage to groups of five or more; meeting almost every conceivable requirement of numbers and condition of families. They are thoroughly unpretentious in character, and they are cheap. The great agricultural societies, especially the Royal Agricultural Society, and the Yorkshire Agricultural Society, took up the subject of cottages about the same time, offered prizes for the best designs, and published the results. But by far the greatest share in promoting the cause of Cottage Improvement, and providing a large variety of commodious and inexpensive plans, must be assigned to the "Society for Improving the Condition of the Labouring Classes" (which has its office at Exeter Hall, and its publication, "The Labourer's Friend"), and more especially to the late honorary architect of that Society, Mr. Roberts, who, at home and abroad, in town and country, has done more than any individual, and I may say, any body of men, to disseminate reliable statistics and information about the dwellings of the labouring classes, and to carry out practical measures for their improvement. His pamphlets and lectures are generally too well known to require me to specify more than one, the last, just published by Ridgway, and entitled "Essentials of a Healthy Dwelling." I might have been charged with direct plagiarism, if I had seen his pamphlet more than a week ago, for it contains a design almost identical in general ground-plan with the one which I exhibit; but my own has been in the course of modification for the last two years, though no doubt indebted to some of Mr. Roberts' earlier plans for many features of its arrangement.

The one before you was, however, more directly modified from a ground-plan given in Mr. Strickland's most valuable pamphlet on "Cottage Architecture," being an examination of the best designs sent in to the Yorkshire Agricultural Society in 1859.

I could not have greater confirmations of the excellence of this plan than the facts, that almost the identical arrangement has been sanctioned by Mr. Roberts, in his latest publication, as the best which his matured experience can recommend; that so practical a man as Mr. Strickland adopts the same; and that the latest prizes awarded by the Leeds and Royal Agricultural Society embody its main features.

Such a concurrence of authority almost settles the question as to the best general arrangement for a double cottage; and is the more remarkable from the great divergence of the earlier prize designs, one from another, and all from this. I wish most explicitly to disclaim for myself any claim of originality in this plan. I put forward a much stronger claim on public gratitude if, after having carefully examined many hundred plans (as I have done), I have selected that which has the concurrent approbation of the best authorities on the subject, and will bear the criticism of the present meeting.

It is from the sources I have indicated, that I have drawn out (by the assistance, originally, of my friend Mr. Slater, and now by the aid of my friend Mr. Pedley, who has kindly made the elevations for me—and these are entirely my own) what I will not call a "Model Cottage" (for I should be very sorry to see any one type repeated and repeated over the whole country), but yet one which combines all the requirements that I have found to be demanded by those who have studied the subject, and from the experience which I have gained by enquiries among the agricultural labourers of my own parish. I think it better to exhibit only this one design than to complicate the matter by a variety of plans of elevations, with which I should have to find more or less fault. Of course this which I exhibit is open to criticism; and I hope that it may call forth discussion from those who have given attention to the subject of cottage-building. This design, then, professes to be for a pair of cottages for agricultural labourers. It is not suited to be built singly, or in a row of three or more. But a pair of cottages is the most frequent requirement for the country; because the single cottage would of course be comparatively dearer; and, from having all its sides outer walls, would, with the same thickness of brick, be much colder; while a row of cottages, besides being by association less country-looking, is also far less convenient for having a garden allotment attached, of sufficient size to enable the tenant to pay a remunerative rent.

It is in that way that I could meet the difficulty of the landlord's gaining a fair return for his capital. For the mere house, it cannot be done from the ordinary pay of a field labourer. Eighteenpence a week is as much as a man can well pay for rent, out of 12s. or 14s. a week wages; but £4 per annum is poor interest for £120 or £150 laid out by the landlord on a cottage which he has to sustain in repair; but add a quarter or half an acre, at ordinary farm rent, and the extra £1 or £2 which the cottager has to pay is more than compensated to him by the market-garden value which the land at once gains in his hands. Thus, by converting the grass or arable ground into garden, and affixing it to the cottage, the extra rent which the landlord may at once put upon the whole makes up to him for the insufficient return of the house singly. I need hardly observe how doubly valuable to the cottager is the land attached to his dwelling, compared

with the field allotment, which, as all who know country customs are aware, is almost always staked out in the most distant and inconvenient corner of the parish.

I enter into this part of the subject, because it meets the financial point of the question—in this as in every other matter—the one on which all eventually turns. If it were not that cottages are required to be built cheap, we need not consider the matter at all. Or let me not say "cheap." Let us only make a cottage *remunerative*; and we have not to consider whether it is cheap, but whether it is good. The plan I have indicated will unfortunately only meet the cases where land is at its natural value as land, and is at the disposal of the builder—but this is the case in nine-tenths of our rural parishes, and it is with these that I profess to have most to do.

(To be continued.)

WEST BROMWICH SCHOOLS.

OUR principal illustration this week represents some projected Church schools at West Bromwich. Messrs. Green and De Ville, of 36 Ormond Street, architects, say:—We propose to construct the walls of the building of the new red sandstone, with occasional bands and arches of coloured bricks or stone, and the dressings of oolite, the roofs being covered with slates of various colours. The schools are planned according to the requirements of the Committee of Council on Education, and are designed to accommodate 450 children. On the ground floor is placed the infants' school, with a south-west aspect, accommodating 150 infants, and the girls' school, with a south-east aspect, accommodating 150 girls, over which is a schoolroom for 150 boys, reached by a stone staircase in one angle, surmounted by a bell-turret. The infants' and girls' schools are divided by a double curtain, which allows of the two being thrown into one large room for assembling all the children at one time. All three schools would have a separate playground, and adjoining the building is a master's residence with a garden attached. The schools are provided with class rooms, and fitted up, warmed, and ventilated in the usual manner. The estimated cost of the buildings is about £2,000.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary general meeting of this body was held at the rooms, 9 Conduit Street, on Monday evening; Mr. ARTHUR ASHPIEL, V.P., in the chair. Mr. John Henry Parker was introduced as a newly-elected honorary member of the Institute.

The CHAIRMAN announced that the annual *conversazione* of the members of the Institute was to be held on the 25th of June, and that notices of contributions of works of art for use on the occasion should at once be sent in to the honorary secretaries.

Mr. JOHN W. PAPWORTH then read a paper, ON AN *ÆSTHETIC PRINCIPLE IN DECORATION*. The paper, which is not to be published at present, was illustrated by a number of drawings. The lecturer endeavoured to establish the following points:—first, they had no safe guide in decoration except that which arises from a careful study of executed examples, judged upon principles that were easily found; that those principles were opposed to the enrichment of sculptured ornaments by colour under any other pretence than that of gilding (and he contended that he had on a previous occasion established the fact that gilding was a barbarism in statues and in ornament); that gilding in all its branches was not a falsehood, and that in most of the cases in which certain persons had raised the cry, "A sham, a sham!" the sham had really been their apparently virtuous indignation.

Mr. WILLIAM WHITE proposed a vote of thanks to the author of the lecture. The lecturer asked them whether they would construct their decoration, or decorate their construction, as though the alternative lay between these two matters; but there might be a thousand other compositions equally to be taken into account. Again, he thought there was one point in respect to that from which the lecturer had rather held himself aloof, and that was the need of positive colour as attested by the universal taste of mankind. People would have colour in all their rooms, and in all other places where they were to be for any length of time. In many mediæval works there was a very common decoration, which consisted of stencilling out in stone without any under lime-wash. There could be no doubt whatever as to the accuracy of the principle laid down by the lecturer in reference to the truth of construction. But that did not argue against the truth in construction, and he hoped that Mr. Papworth would have shown them some principle as to what was truth in construction, because there were many truths which were not paraded, and might be worse for being paraded. In nature the most beautiful things were those that had no utilitarian advantage in the way other constructive art had. Look at the petals of flowers, and the delicate texture of the flowers themselves; they had no positive utilitarian use, and yet they were some of the most beautiful things in nature.

Mr. J. H. PARKER, having been called upon by the Chairman, said his study had been confined chiefly to the history of architecture, without extending to its æsthetics, or principles. He had always thought that colour was meant to bring out the forms.—Mr. W. BURGESS said, colour was a gift of the good God, and if a man had not that gift, all the world could not make him a good colourist.

Mr. MORRIS said, he thought they should look at architecture in its grandest light and aspect, and then they would find that decoration and

bits of fancy colour were all very subordinate indeed. If they looked at the works of the ancients, they would find that all the durable decorations were in relief, and it appeared to him that architecture should be kept up and looked to in that way as a decorative art, without depending upon painting or sculpture. And he thought the more this independent character was kept in view, the grander and more important would architecture be as an art.—Professor KERR said, they should both decorate their construction and construct their decoration, but they were in the infancy of the study of the real principles of decoration. He disputed the doctrine of Mr. Burgess, about colour being a particular gift. He did not think every man wanted colour, and he did not like Gothic colouring. When they copied nature they did wrong, but so long as they followed nature to the idea of conventionalism, then they did as much as they could in the present infancy of decorative science.—Mr. C. F. HAYWARD said, there were very large portions of educated people, who desired to have good and proper coloured decoration, and that the uneducated mind desired colour was quite clear to everybody.—Mr. MAYHEW thought all liked colour more or less, especially the ladies. He would not like to sit long in a room where there was not colouring, but the chief thing to be avoided was false colouring.

The CHAIRMAN was of opinion, that if proper attention were paid to the matter, it would be found that there was not so much difference between the Gothic and the Classic as to decoration. As to nature, they could not follow nature in an arch or roof, but what they should bear in mind was accuracy and propriety. There was very little genuine authority to show that the Greeks used polychromy outside, although they did so inside the building. We should not ourselves polychromise the outsides of our houses, and he believed with Mr. Parker, that the great use of colour was to enrich and to enhance the beauty of a building.

The following gentlemen were, on ballot, admitted members of the Institute:—Mr. John Samuel Phené, of 34 Oakley Street, Chelsea; Mr. Gore Ouseley Lane, of 4 Dawson Place, Bayswater.

CHURCH, CHAPEL, SCHOOL, AND OTHER BUILDINGS.

WALSOKEN.—On Thursday afternoon, at New Walsoken, the first stone of the new Chapel-of-ease, was laid by Mr. R. Young. The architect is Mr. W. Adams, and the builder Mr. J. H. Andrews. A brass plate was enclosed in a cavity in the stone, recording the particulars of the event.

EATON CHURCH, NEAR CONGLETON, CHESHIRE.—A beautiful western window was placed in this church last week, on the anniversary of the death of the lamented Mr. G. C. Antrobus. The window, which is a memorial one, is the united offering of the tenantry and inhabitants of Eaton, headed by the incumbent, the Rev. J. P. Firmin. It is from the studio of Messrs. Edmonson and Son, of Manchester, and represents the parable of the good Samaritan, with the suggestive words underwritten, "Go thou and do likewise." Beneath the subject is the inscription, "In memoriam Gibbs Crawford Antrobus. Obiit 21st May, 1861." In the upper tracery of the window are foliage and other ornaments, surmounted by the shield of the deceased. The colouring of the window is clear, but well tempered and toned into harmonious general effect; and though the whole appearance of it is highly pleasing, it very properly does not vie in brilliancy with the beautiful chancel window by the same artist, erected four years ago by the masonic body in the neighbourhood as a mark of respect to the late Mr. Antrobus. We understand that in addition to the window it is intended by the parishioners to place a monumental cross in the body of the church.

ST. GILES, EXHALL.—The old parish church of St. Giles, Exhall (anciently Eccleshall), near Alcester, Worcestershire, has been restored at a cost of about £900. The works have been completed very satisfactorily. The Rev. H. C. Carleton, rector of Arrow and Exhall, has subscribed handsomely to the restoration fund. Mr. Solomon Hunt, of Harvington, was both architect and builder.

HIGHWORTH, NEAR WINCHESTER.—The restoration of the fine old church at Highworth, near Winchester, is nearly completed, and reflects credit on the architect, Mr. Hugall, and the builder, Mr. Pedley. The opening takes place to-day (Friday).

ST. PETER'S, MARLBOROUGH.—A vestry meeting was held last week to consider the plans and specifications furnished by Mr. Wyatt, the diocesan architect, for repairing, amending, and re-pewing the church. The rector occupied the chair. The churchwardens, Dr. Fergus, W. C. Merriman, Esq., John Halcomb, Esq., and a large number of ratepayers attended. The plans, &c., were produced by the rector, and the proposed alterations having been explained and discussed, the meeting was adjourned for the purpose of obtaining further information from Mr. Wyatt. A working committee, consisting of the rector and churchwardens, and a committee of reference were appointed.

NEW CHURCH AT WARTER, NEAR POCKLINGTON, YORKSHIRE.—The corner-stone of the new church at Warter, was laid a few days ago. For the removal of the old church (which for years had been in a dilapidated condition), and the building of a new one, the parishioners are indebted to the liberality of the principal landowner in the parish (Lord Muncaster, of Warter Priory). The stone was laid on the south-west angle buttress of the church, which will be built in the Gothic style, and consist of a nave and chancel 89 ft. long by 33 ft. 6 in. wide, with a tower and spire 120 ft. high. The architects are Mr. William G. Habershon and Mr. Alfred Pite, of London; the builder, Mr. Ralph Weatherley, of York.

HOLY ISLAND PARISH CHURCH, DURHAM.—As the restoration of this

PROJECTED CHURCH SCHOOLS, WEST BROMWICH.

C. NEWELL, L. P. 1864.

church proceeds, matters of interest and beauty are constantly discovered. The arches of the nave have been cleared of centuries of whitewash, and exhibit an architectural construction of rare excellence and beauty. The pillars on the north side are circular, on the south octagon. Some of the arches are constructed with alternate white and red stones, while the masonry is of the most perfect kind. The arches on the north and south are different in architecture, construction, and size. Altogether this church will exhibit some of the most extraordinary freaks of ancient architecture yet discovered in the kingdom.

HOLME CHURCH, NEAR STAMFORD, LINCOLNSHIRE.—The church at the village of Holme, having been found too small for the requirements of the parish, has recently been considerably enlarged. The edifice comprises a nave and aisles supported by Norman arches, and has a light and elegant appearance. The benches are entirely of oak, the ends nicely carved, the whole facing the pulpit. The floor is tessellated with red and dark-coloured glazed tiles. Iron gratings run up the aisles, under which are pipes conveying hot water for warming the building. The roof is ribbed and vaulted, and, as well as the lectern and reading desk, is of red pine stained to resemble oak. The pulpit is of marbled alabaster with carved bosses running round the base, emblematical of the four evangelists, and mounted on a pillar of Helpstone stone. The entire cost of the building is about £2,000, the greater portion of which has been met by Wm. Wells, Esq., the lord of the manor, and the rest by a rate of 1s. in the pound, extending over two years. The church, which is calculated to hold about 350 people, was erected by Messrs. Perkins, of Easton, and Bradshaw, of Stamford, under the superintendence of Mr. Browning, architect, of Stamford. The iron building formerly used at Millfield, Peterboro', for a Sunday school, having been purchased of Mr. Stanley's executors, was appropriated to the purpose of public worship during the progress of the erection.

WAKEFIELD CHURCH INSTITUTION.—On Tuesday evening, the building erected for the purposes of the Wakefield Church Institution at the top of Westgate, in that town, was inaugurated. The building may be called geometric Gothic, and has been erected from the designs of Mr. Higham, of Newcastle-on-Tyne. The cost of the building, apart from the site, has been about £2,000. The lecture hall is acoustically well constructed, and there are a reading room and library on the ground floor, as well as several large and well ventilated class rooms on the basement story.

ST. JOHN'S, DURHAM DOWN, BRISTOL.—A writer to the *Bristol Daily Post* says:—"It is stated that funds are being raised for the erection of transepts, and for effecting other alterations and improvements, with a view to meet the necessity for additional church accommodation in this rapidly increasing parish."

CLASS OF DESIGN OF THE ARCHITECTURAL ASSOCIATION.

A MEETING of this Class took place on Friday last, when there was a large attendance of members. The President of the Class, Mr. T. R. SMITH, occupied the chair. The subject for the evening was "A Parsonage House," designs for which were contributed by Messrs. Beesley, Davies Hack, Julian, Molecey, Paris, Payne, Ridge, Sills, Spiers, Tarver, and Walter, and which were freely criticised by the chairman and members of the Class. The designs were accompanied, in the majority of cases, by plans of the several floors, and several of the drawings had been carefully studied, and were very meritorious. After the examination of the sketches, the Class proceeded to elect officers for the ensuing session. Mr. T. Roger Smith was unanimously re-elected President, and Mr. R. O. Harris, Vice-President. Mr. E. J. Tarver was re-elected honorary secretary, in conjunction with Mr. L. W. Ridge, and a vote of thanks was passed to Mr. Walter, the retiring secretary. The meeting then adjourned to Friday, the 13th of June.

Reviews.

Second Annual Report of the Society for the Acclimatisation of Animals, Birds, Insects, and Vegetables within the United Kingdom. 1862. Offices, Duke Street, Adelphi.

From the report before us it appears that the anticipations of the success of the Society have been so far realised, and that, considering the short time that it has existed, and the difficulties that usually beset an attempt to introduce novel ideas and novel experiments, the condition of the society is highly satisfactory. The number of members and subscribers has increased largely since the last annual meeting.

The Assurance of Diseased and Doubtful Lives on a New Principle, more Advantageous and Equitable to Policy-holders than the System hitherto adopted. By MONNIE A. BLACK, Actuary to the London and Yorkshire Assurance Company. *With Observations on the Characteristics of Assurable and Non-Assurable Lives.* By A. P. STEWART, M.D., F.R.C.P., Physician to the Company.

Life Assurance, a matter often sadly neglected even by those who are most eligible both as to health and means, is the subject of this pamphlet. The writer's object is to indicate the general principle on which lives are selected for assurance, the system on which "diseased and doubtful" lives have hitherto been assured, and to develop a new principle with relation to the latter class of lives more equitable than that hitherto adopted. The system hitherto observed, it may be stated in brief, in the case of all

assured diseased lives, is to add a certain number of years to the natural age of the candidate for assurance—five, ten, or fifteen, as the case may be; thus making a candidate, as an assurance subject, so many years older than he really is. Mr. Black entirely discards this method. He argues that the estimate of the value of a life is often false, still oftener mistaken, and generally unreliable, as positive data. He proposes, therefore, in all cases, to give the assurer the benefit of the doubt. Instead of adding to his nominal age, and by so much increasing the premium, Mr. Black's plan is to accept candidates at their real age, that is to say, at the ordinary premium, and charge the estimated depreciated value of the life on the policy, to be deducted in case it becomes a "claim" within a specified number of years; and if the life survives the specified number of years, no deduction from the sum assured is made. This plan, it must be confessed, is both easy and equitable. It gives the candidate whose life is assumed to be diseased the chance of assuring on the ordinary terms, and the further chance—if his life should prove a good one—of escaping altogether any additional charge.

The Church's Floral Calendar. London: DAY and SOX, Lithographers to the Queen.

This is one of the most beautifully executed works we have ever seen. It is compiled by Emily Cuyler, with a preface by her brother the Rev. F. Shelley Cuyler. The illustrations are designed and chromo-lithographed by W. R. Tynms. The object of the book is to associate flowers with principles. The theological spirit of the book may be seen indicated in the following sentences, which constitute the concluding paragraph of Mr. Cuyler's preface. "It must, however, be borne in mind, that with some holy days, more than one flower is connected with tradition; as, for instance, in the case of the Annunciation, to which appertains the flowering almond, the white lily of the Annunciation, and the cardamine flower. In such cases the compiler has confined her choice to the one which seems best adapted to the festival, or the most sanctioned by use."

THE REV. GEORGE WILLIAMS, B.D., ON ECCLESIASTICAL ARCHITECTURE IN GEORGIA AND ARMENIA.

(Concluded from our last.)

THE CONVENT AND CHURCHES OF SAFFARA.

WARDSIA.—Still ascending the Kur, which here runs through a rocky gorge, dominated by the picturesque castle of Tionmoule or Inogvi, situated on an almost inaccessible hill on the left bank of the river, we reach the rock-hewn convent of Wardsia by a road scarcely practicable. This convent is entirely excavated in a precipitous rock, which rises from a narrow plain on the left bank of the Kur, and consists of nearly 400 chambers of various dimensions, among which are found one large cathedral church and six or seven small chapels. The whole place has been given over to centuries of desolation or desecration, during the occupation of this part of the country by the Turks; but quite recently, a vigorous lay-brother, a Greek from Trebizond, has been earnestly employed in clearing it of its pollutions. The cathedral has been restored, so to speak, and furnished with a new iconostasis; and the Divine offices, with the Liturgy of S. Chrysostom, are again celebrated there by a Greek priest, also from Trebizond, in the presence of a few of the orthodox villagers from the neighbouring village of Tsounda. I can only briefly notice the cathedral, which is situated about the middle of the convent. It has a kind of porch, opening into it from the south, supported by two pillars left in the live rock, and is lighted by apertures pierced in the same. It measures about 45 ft. by 25 ft., and is about 40 ft. high; the rock at the east end is formed into an apse. On the north is a kind of aisle of irregular shape, in which is the mausoleum of the renowned Queen Tamar, who passed much of her time at this place, and whose spacious apartments, with their wide divans, all excavated in the natural rock, once communicated with the church by a passage and stairs, still to be traced. This queen, who died in A.D. 1212, was daughter of George, who reigned from 1156 to 1184, and is said to have commenced this monastery, which was finished by his more renowned daughter. Of the chapels I can only mention one, which is entirely covered with frescoes, evidently executed by a Greek artist, probably a monk of Mount Athos, for not only are all the subjects treated, and all the figures represented in the conventional style of the Greeks, but the names and legends attached to each are certainly in the ancient Greek characters, though Brunet has pronounced them to be Georgian. The only piece of masonry in this extensive convent is found in the entrance gateway, which may also have served for a belfry; but the upper story is now destroyed. This building which is comparatively modern, may date from the restoration of the monastery, after its violation by (Tamerlane) Thab-Thamraz, about the middle of the eighteenth century.

Mtzhetha.—I have yet to describe the most venerable, and to me the most interesting of all the ecclesiastical monuments of Georgia, situated also on the Kur, but at a distance of little less than 200 miles from the convent last described. Only one post short of Tiflis, at the confluence of the River Aragva with the Kur, is found the site of Mtzhetha, once the civil and religious capital of the Georgian kingdom, the venerable cradle of the national church, and the seat of its Catholicos, until, within the last few years, the Russian bureaucratic rage for centralisation, most unhappily, as I think, transferred the metropolitan see to Tiflis, and merged this ancient independent branch of the orthodox Church in the holy governing Synod of St. Petersburg.

Meanwhile, the material landmarks of this much enduring church still remain, mutilated and debased no doubt, and grievously shorn of their ancient dignity, but only the more dear on that very account to those who cherish a feeling of veneration and love for what presents the noblest example which ecclesiastical history has preserved of allegiance to the faith of Christ, under hardships and privations and persecutions which have no parallel in any other church in Christendom.

I have two churches to describe, the "Ouspenshi Sabor," or church of the Assumption, and the Cathedral of the Twelve Apostles. The Ouspenshi Sabor, is the conventual chapel of a small nunnery, which doubtless occupies the site of a more numerous and influential religious house attached to this abbey

church, in the palmy days of Georgian Christianity. It stands in a court of some considerable size, surrounded by a high wall, within which, on the south and south-west of the enclosure, stand the houses of the nuns and the hospitium and guests' house, which are modern constructions, and demand no notice.

The north-east angle of the close is occupied by a very small chapel dedicated to the memory of S. Ninia, the apostle of the Georgian nation, who, a humble slave girl herself, emancipated the king and people of the land of her captivity with "the glorious liberty of the children of God." At the north-west angle is a square tower, with a polygonal lantern, with a conical roof, which may formerly have served for a bell-tower, similar to that over the chapel of S. John Baptist, at Saffara.

But I must proceed now to notice the church itself, which is of the same type precisely as that of Timotheisméne, and as the principal church of the Convent of Saffara. I shall, therefore, notice only those features which are peculiar to this church. Externally I have to notice a double base-table, the lower 4½, the upper 9 in. deep; each 9 in. wide, serving as a continuous pedestal for the pilasters, which support an arcading that runs round all that part of the original wall of the church which is still exposed to view; for additions, of which I have to speak presently, have been made to the church, both on the north and south sides. This arcading is common to this church and the cathedral, and I see, from drawings, that it was applied also to other churches in Georgia. It is admirably executed, and indeed the whole construction of these walls is a masterpiece of masonic art. The east wall is arcaded in five, giving one arch to each aisle, and three to the chancel, which rise much higher than the side arches. There is a curious angular recess between the two shafts that support the side arches of the chancel, the only exterior indication of the apsidal termination within, for these recesses are formed in the thickness of the wall formed by the apse. But the most remarkable feature in this church is the chapel abutting upon its south wall, and forming, in one of its bays, the porch of access to the church itself. This chapel is covered with a gabled roof at right angles to the roof of the church, and tiled, while all the other roofs are of the same solid ribbed stone as we have noticed elsewhere. There was formerly a brick porch at the west end, which is now in ruins, and a lean-to cellar-like building covers the northern wall for a length of 65½ ft. from the west end, being only 14 ft. wide. The church measures externally 90 ft. by 56 ft., not including the chapels. I must not quit the exterior without mentioning the very rich arabesque ornaments which cover the gables of the transepts, which are arcaded in three; the wall border, the middle arch being pierced with two lights, while the side arches, which are much narrower and lower than the centre, serve as frames for double blind lights, which seem never to have been pierced.

Entering into the interior through the second bay (from the west) of the south chapel, the arch of which is nearly double the width of the others for the purpose of forming a porch, we find this chapel highly ornamented with good stone carving of the Byzantine character. It is divided internally into four bays; whereof the easternmost has an apsidal termination, the next bay to this has a flat dome vault resting on pendentives, exquisitely sculptured, and its walls are richly arcaded and recessed. The interior of the church itself corresponds in all its main features with Timotheisméne and S. Saba, already described, but a low stone screen of Byzantine character, with the arches entirely open, in place of the usual iconostasis of closed panels, is a peculiar feature of this church. The synthronus here is more developed than in the church of S. Saba. There is in the centre of the apse a large throne, to which is an ascent by four wide steps, which run entirely round the apse, and seem to have formed a double row of benches for the chapter of the convent. Besides the episcopal throne in the apse, there is an ancient canopied throne, richly carved in stone, raised two or three steps, attached to the eastern face of the pier which supports the lantern on the south side of the nave; and in the corresponding position on the north side is a very massive chair in black marble, without any carving. The former of these was said to be the throne of the Metropolitan, the latter of the hegumen.

This church was undergoing very extensive repairs when I was there, and was entirely denuded of furniture, which considerably facilitated my survey. The nuns were meanwhile assisting in the offices at the cathedral, which I have next to describe. I shall be as brief as possible.

The Cathedral of the Twelve Apostles is a building of the greatest interest to the sacred archaeologist and ecclesiologist, as being that which undoubtedly occupies the site of the first church of Georgia, erected during the reign of Constantine the Great; while the existing building, though often ruined by accident or violence, and as often restored, yet unquestionably exhibits in its main features the identical church in which many generations of the orthodox kings of Iberia received their coronation unction, and in which the mortal remains of the royal family have been interred for centuries. But we are at present engaged with the architecture, not with the history and antiquities, of Georgia. The church is situated within a kremlin—a name common in Russia to any fortified enclosure surrounding a church, such as that most celebrated one at Moscow: the Acropolis at Athens, or the Capitol of Rome, would have been kremlins to the Russians. The high wall of this enclosure is flanked with square and circular towers, which give it quite the character of a fortress; and the buildings occupied by the priests and servants of the church are situated on the west and south sides of the close; the palace of the Metropolitan I did not distinguish amid these half-ruined habitations.

The church itself has the same double base-table, and an arcade running round the walls, with niches in the east end, similar to the Church of the Assumption; but it has also some curious sculptured stones placed in the wall at random, as it would appear, by way of ornament—some carved in arabesque patterns, others rude representations of animals unknown to zoology—possibly recognised in Georgian heraldry. I found the church to be 160 ft. by 66½, interior measure. The height of the lantern, I read, is 112 ft.

It has these peculiarities. A narthex, covering the whole of its west front, besides the square porch which we have found in the other churches. This narthex has a roof of its own, lower than that of the church, so that the aisles of the nave have windows in their west walls, above the roof of the narthex. The church has also double transept aisles, which within appear like an extension of the nave eastward, and of the sacarium westward, one bay each; it is only the roofing that indicates that they really are what I have stated them to be. The iconostasis is advanced westward of the eastern aisle of the transept, and stands between the two eastern piers of the lantern. A modern and tawdry iconostasis has lately been substituted for the old one, the fragments of which

were resting against the south wall of the transept, and the grim-visaged figures of the old national saints in their picturesque costumes appeared to me much better to harmonise with the genius loci than these miserable specimens of modern art and debased taste. The lantern is a polygon of sixteen sides, and springs immediately from the pendentives, without the intervention of the circular drum which is found in the Church of the Assumption. Between the piers of the nave on the south side is a low square column, surrounded by a wood frame, canopied and covered with ancient paintings—an object of special veneration to the Georgian Christians, as being the place where a miraculous flow of ointment indicated the presence of the seamless coat of our Lord, the most precious relic of the Church and nation. Close by this, on the east, is the throne where the Georgian kings were crowned by many successions of Catholic, from the days of Miriam, their first Christian King, until the last of the royal line, George XIII., at the close of the last century. There is an ascent of two steps to the synthronus, which is divided into stalls, five on each side of the throne in the apse, with an extension eastward along the flat wall of the sacarium. Immediately behind the altar is a large and massive silver cross, used in processions, covered with Byzantine chasing, very rich and of great antiquity. The church also possesses a reliquary of ancient date, which the Catholics was wont to wear as a breastplate on great occasions, in imitation, it may be presumed, of the Urim and Thummim of the Jewish high-priest.

This allusion has carried me again to Jerusalem, and I must not leave this interesting church without directing your attention to a stone model of the Holy Sepulchre, which is erected against the south wall of the narthex—another memorial of the old communion between the Georgian Church and the Holy Land, to which I have already more than once referred, and to which I must further allude, in conclusion, in order to call to your notice the remarkable resemblance that is still found to exist between those churches which I have described, and two of the eleven churches which still exist at Jerusalem, which are historically known to have belonged originally to the Georgians. I allude to the Church of S. James, now held by the Clemenians, on Mount Sion, and the Convent Chapel of S. Salvador, occupied by the Franciscans since the sixteenth century. I am enabled, through the kindness of Signor Pierotti, to exhibit ground-plans of both these churches, and a section of one, a glance at which will at once show you how remarkably, in this instance also, architectural science confirms historical testimony.

I was to have said something on Armenian as well as on Georgian Ecclesiology, but have left myself less than no time to do so, having already exceeded the limits assigned me. I regret this the less, because, having been prevented by illness from exploring the Armenian churches of Tiflis, and from prosecuting my contemplated journey into Armenia Proper, I could only have reported upon them at second hand, from books, which probably are accessible to all, in the reading-room of the British Museum. I thought I should be doing better service if I confined myself to the results of my own actual surveys of buildings which have either never been described and illustrated at all before, or in so very slovenly and careless a manner as to mislead rather than to guide the student who would investigate this almost untrodden, but most interesting and instructive, field of ecclesiological research. I feel that I have done but scanty justice to my subject, but I trust I have furnished you with elements for the investigation of the curious question of the place which Georgia occupies in the development of religious architecture—a question which appears to me to offer some problems not very easy of solution, and which I gladly leave in abler hands.

ON THE LIFE OF WELBY PUGIN.*

THE remainder of the chapter of this great artist's manhood need not take much time to tell. In 1843 he published another book, entitled "An Apology for the Revival of Christian Architecture in England." The character of the book is the same as before: the same style of enthusiastic exaggeration, mars its merit. To such a degree does he in fact give way to the old spirit of "contrast," that in presenting, in comparison with a standard Mediæval gateway, the majestic Doric portico of the Euston Square Railway entrance, he draws it in a manner literally that of a common shop-card engraver.

The "Glossary of Ecclesiastical Ornament and Costume," which he published in 1846, elaborately illustrated in chromolithography, is considered to be a very able, and indeed learned compilation. It is in that light the only one of his works which is of permanent value as a book of reference. As regards our present view of the author's place in art, we need only remark, that the tendency of the "Glossary" was still toward the resuscitation of ritual symbolism, and still, in its application, confined to the Roman Catholic church: and that it was deemed at the time to be another successful effort towards the earnest purpose of his life,—in some respects the most successful of all, seeing that the nature of the work kept in check that tendency to exaggeration of argument which was the great fault of his heated enthusiasm. His immediate object was to promote the amendment of art in the vestments, vessels, and furniture of the Romish ritual; but it might safely be said that its ultimate effect was much greater in the Protestant church than in the Catholic.

We have not time to dwell upon a visit that he paid to Italy in 1847; but it may be remarked that his reflections were characteristic as ever. He came home much improved in his style of drawing, much incensed at Pagan churches in Rome, much pleased with Italian Gothic buildings; but not in any degree changed in his opinions or subdued in his enthusiasm. To the end of this chapter of his best days we have to place Pugin in the same relation to his heart and his faith with which he set forth upon his career; to assign him still the same transcendental enthusiasm, developed still with the same passionate argument, springing still from the same root of artistic religion, and tending to the same rich and refined exuberance of mystic ritual. Every successive year of life confirmed him in his convictions all the more. That his fanaticism was the fire of real genius his persistency proved; for he withstood all assaults successfully. He could even acknowledge that in his practical work he found it frequently beyond his skill to adhere to his theoretical principles; and he could do this without giving the advantage to his opponents. The fervid and natural eloquence of his writing proves that he was neither vain nor affected, as many men of genius are. In a word, his spirit was in the clouds: his most intimate associates had but little knowledge of his thoughts,—passionate, eccentric, fanatical thoughts that were above them.

* See p. 361, ante.

It forms a striking episode in his biography, but fortunately demands no particular notice in such an argument as ours, that in 1844 he became once more a widower, at the still early age of thirty-two; that the superior connection which he enjoyed in Romanist society prompted him to seek a fresh alliance, where on two occasions his eccentric character caused him to be disappointed; that his irritation on the failure of the second proposal led him to publish a most injudicious pamphlet on the subject, which, however, the advice of a more prudent friend led him to suppress; that he at length, in 1818, found another consort, now his widow; and that, amongst other oddities, he then issued a dainty Medieval wedding-card, which, by itself alone, simple as it is, must be pronounced a charming work of genius.

At St. Augustine's Grange, at Ramsgate, Pugin still dwelt in such manner as from his past habits we should expect.

From 1841 forward, for about ten years, his life was one that will long be a not unpleasant legend of the seaside town. He lived in a quaint Gothic asceticism, which one might not irreverently call the habits of a hermit with a large family and an extensive business. In early morning at prayers in his domestic chapel punctually as the bell tolled the Angelus; at prayers again at half-past seven, habited in cassock and surplice; at breakfast for seven minutes, and no more; at mass on feast days at eight; taking the simplest possible dinner of fifteen minutes, at one to a moment, still abjuring beer, and none the less more noble wine; at work, work, work, between these hasty meals and prayers all day and evening; at Commune at ten; for an hour afterwards at his books; then to bed till six again. Hating, as he alone could hate, with what his biographer calls "an intense and holy horror," all public charities, as unlicensed, uncanonical, unritual, unmythical "abominations" (to use a word of his own), he set up at this St. Augustine's an odd, independent, self-willed sort of charity, as essentially Gothic, artistic, ritualist, as all else about him. He kept a great stock of clothes, and gave them away to ragged men in suits; he would rush at any instant's notice to the rescue of the shipwrecked sailor, and out in his boat to help some shattered vessel in a gale upon the fatal Goodwins; he would carry on his shoulder, on a Sunday afternoon, such a thing as a load of bedding, and in his hand a bag of provisions, because some ragged shipmate had sprained his leg, and was laid flat on his back like old Bill Barley; he would provide for an entire shipload of poor foreign emigrants driven to port by stress of weather, so that one of them, their elected spokesman, being unable to make himself otherwise understood, could only place his neck under the benefactor's foot for gratitude; and all the while he stuck to Christian art and his boat; played quaint Gothic miracle plays at Christmas and Twelfth-night, and sailed out cheerily in sunshine or in breeze, to stretch his spirit in a long and bracing run upon the open sea.

IV.—THE END.

All through his life, let me repeat again, I have found myself compelled to regard Pugin as a mystical ritualist: his religion ritual, ritual his art; his religion and art therefore the same—a combination of the fanatical zeal of the one with the poetic passion of the other, which has probably never been otherwise met with, at least in the world of the present day, and in the atmosphere of England. It was on account of ritual alone, as I hold, that he chose in his early youth the Romish Church. Now what would be the effect upon his mind if in the course of time the English Church were to begin the earnest encouragement of ritual reform; to do so in obedience to his own teaching; to apply to the task all that wealth, social influence, public spirit, political respectability, which the great Established Church alone commands; to work in the cause with such a will that before he himself had attained the age of forty it had outstepped the Romish ritualism altogether, and left it lagging behind in apathy; and what would be the effect upon his mind if, at the same time, as the meditation of more experienced age and deeper learning became more assured and more profound, the feeling had been forced upon him that his idolised Romish Church was, in respect even of the ritualism for which he had embraced it in his youth, very much of a make-believe after all? And what would be the effect upon him if he had had controversies with infallible divines—paper wars, bitter personalities, in which he had been ridiculed by the priesthood itself as a fanatical materialist, whose notions were out of date in these days of plain faith and doctrine; when the gaudy bedizenment of cathedrals for the glory of God had given place to the building of numerous rather than costly houses of prayer for the accommodation of practical people?

Whether I am right or not in the suspicion which is implied in these questions; whether better informed persons—his connections at the time—were right or wrong in their declarations of his true and secret feelings; at all events, it seems to be acknowledged that, about the year 1850, there arose serious misunderstandings between Pugin and his ecclesiastical rulers. The proper submission of his fallible judgement to the infallible authority of the Church began to be considered questionable. Why are our priesthood, he may be imagined to have asked, so apathetic in respect of the venerable mysticism of their holy ritual? The priesthood, would be the answer, are the sole guardians of that matter. But they are dull and inanimate—dead and cold. In your fallible judgement they may be so; that does not affect the question. And, in fact, the rumour began to spread that Pugin had at length become troublesome with his crotchets, and must be kept in his place. In the Romish Church it is understood that a man is very peremptorily dropped out of confidence, favour, and patronage, when he becomes restive; and we will all agree that, if Welby Pugin began to suspect that he was being so treated, the effect upon himself would not be of a soothing, certainly not of an intimidating character. When he undertook to assist Sir Charles Barry in the finishings and furnishings of the Palace of Westminster, I know not whether his independent practice had begun to fall off or not; but it is understood that, for the last few years of his life, his Roman Catholic connection in business was not what it used to be, and that his reflections thereon were not of a conciliatory kind.

The year 1851 was very full of incident to Pugin. He took charge of the Medieval Court of the International Exhibition; and his design and arrangement of the objects were much admired. This, and his employment at second-hand upon the Houses of Parliament, may be called his first public engagements. Hitherto his bigoted faith, his secluded mode of life, and his bitter pugnacity, had made him a sort of public enemy; and the greater his ability the more dangerous his character: but time had cured this; still more than time, the change in public opinion upon his favourite subject had changed his estimation; and, consequently, the author of the "Contrasts," when he became the

commissioner of the Exhibition, and the honoured colleague of Barry, was a popular man. The Anglican church critics, who in bygone years had carped and cavilled at his failings all the while that they pored over his teaching, were becoming his open admirers. This may all have had its influence upon his mind. In a word, it is the opinion of many that, if not distinctly contemplating a return to the Protestant Church, he was at least wavering very much in the subordination of his fallible judgement. Upon the purely religious question, however, we may touch but very briefly.

At the very time when he was occupied with the Exhibition court, he brought out two literary works. One was a "Treatise on Chancel Screens and Rood Lofts." In this he openly attacked the Romanist priesthood for their shortcomings in the matter of ritual, and the consequence was much displeasure on their part. They threatened to put his book upon the "Index" of the Pope's excommunication. The second publication was a pamphlet, "An Earnest Address on the Establishment of the English Catholic Hierarchy." The object was to induce the Romish church to meet the famous appointment of prelates, with English titles, by a grand united effort to increase the power and pecuniary resources of the bishops, and of course to promote ritual dignity. An apparently innocent object; but the "Earnest Address" made matters worse than ever. It would seem as if in these two works the despairing enthusiast were giving the church of Rome a last chance for amendment. To quote his stormy paragraphs is what we cannot now do; suffice it to say, that all the vigour with which the "Contrasts" had battered the foe without, was now brought to bear against the foe within. The rapidity with which he delivered his blows was marvellous. It was still early in 1851, when he wrote thus to a friend:—"I am almost distracted; for, in addition to all other labours, I have a most important work on the real cause of the change of religion in the sixteenth century, which will place matters in a totally new light," and so on. This work he did not live to publish; or, rather, its publication was prevented by authority. The title was to be this,—*"An Apology for the Separated Church of England since the Reign of the Eighth Henry; written with every feeling of Christian Charity for her Children, and Honour of the glorious Men She continued to produce in evil Times."* By A. Welby Pugin, many years a Catholic-minded Son of the Anglican Church, and still an affectionate and loving Brother and Servant of the true Sons of England's Church." We can gather from the account given of this by Mr. Purcell, that he began at once with the old ritualistic principle,—the primitive rites, the style, plan, &c., of churches and altars; the form of vestments and ornaments; and that, after pursuing a long and searching argument in that laboured style of conciliation which is more offensive than open scorn, he concludes with invoking his readers "to speak and think with gratitude of the old bridge that has brought us over (the Church of England), and to lend a pious help to restore her time-worn piers." It is alleged by private evidence that he declared, not long after, that "the rest of his life must be one of penitence, to seek forgiveness for the wrongs he had done to the English Church."

It is quite reasonable that those about him should include all this perplexity of opinion amongst the symptoms of the mental aberration which soon supervened. On the other hand, it is open to others to argue that this was but the natural process of development of the great idea of his life, and that the unhinging of his mind was produced by the mighty internal struggle which the derangement of that process occasioned. What might have happened if he had lived in full vigour of intellect for a few years more, we ought perhaps scarcely to inquire. That he would have voluntarily seceded to the Protestant Church I do not believe. That he would have held his peace is no more likely. That private admonition might have led on to public disavowal is possible. He might have then become an aimless broken-hearted man,—as many a great genius had been before him; but he had lived out the term of his mission; his work was done. Amongst the many diverse workers who weave the web of human progress his share was done—honestly done—manfully and well done. Within a little time the dark cloud came over him, as it had come over many another, and will do to the end. It was the oft-told tale of the sudden going down of the sun at noon. The overstrained intellect had broken in pieces. Only one fragment of the once unsullied mirror reflected the light. They calmed his violence by pretending that a church of his was being delayed for want of a drawing. He took the pencil once more in his hand, and drew a clear intelligent design, that the work might wait no longer. There were a few months more of trouble and sorrow, and then there gathered a curious crowd in his Church of St. Augustine, to lay him where the weary are at rest.

Our story is ended; what is its moral? We have followed the history of a great genius,—a very remarkable leader in art—one whose character appears to stand alone in our generation, for the peculiar vigour of its fervid ardour, meditative power, persistent aim; and we reflect that the world is not degenerating yet, but very much the reverse, and that no amount of labour, no amount of success, no amount of fame, seems beyond the attainment of a clear head and a resolute will. But we have also traced the career of the man; and our pride in the great wrestler must be dashed with pity for his broken heart at last. He was born out of due time. Five hundred years before, perhaps five hundred years after, might have suited better this impetuous and reckless spirit,—impetuous and reckless beyond the comprehension of a cold and calculating age like ours. We start at the time during which he seeks to soar above all that is of the earth earthy; we deplore the unhappy fate which brings him to disappointment and despair; we feel a sense of relief when we see him fairly dead and buried, and his vagaries done; we admire his flight amongst the clouds, but we thank God that we ourselves can only read the ground.

At the close of the lecture a vote of thanks was passed to Professor Kerr.

INFLUENCE OF INTERNATIONAL EXHIBITIONS ON WORKMEN.

ON May the 29th, Mr. WILLIAM HAWES read a paper at the Society of Arts on "The International Exhibition of 1862." He demonstrated by facts and figures its superiority to the Exhibition of 1851. In speaking of the influence of such exhibitions on international progress, he said:—"In every department progress since 1851 is manifested in a degree unexpected by the most sanguine. Our trade has in the same time increased more rapidly than in any similar period in the history of the empire. How far this is to be attributed to the stimulus the Exhibitions of 1851 and 1855

gave to the industry of the world, each must form his own opinion; the old jealousy of allowing rivals, especially foreigners, to see what each was doing has passed away, and every intelligent manufacturer now relies upon a reputation gained by the most universal appreciation of his skill. But for International Exhibitions we should not possess a vast amount of useful information, gathered from all countries, of great value to art and industry. It is by comparing each Exhibition with its predecessor that we are able to ascertain, to record, and to profit by the progress of every country in each ten years; and this interchange of useful information enables all to appreciate the advantages belonging to the pursuit of each industry where it can best be conducted, and must lead to economy of production, to the advantage of labour, to the extension of commerce, and to improved commercial relations between manufacturers and producers in all parts of the world.

We have next to consider whether we are making the best use of the great advantages this wonderful collection of human industry places within our reach. I think it cannot be disputed that the highest object of an International Exhibition is the collection and dissemination of the most accurate information concerning the arts, manufactures, and commerce of all countries, thus illustrating the political, social, and commercial condition of their people. Another purpose is the collection of specimens of the mineral, animal, and vegetable productions, or of raw materials, from all parts of the world; but this is of secondary importance, as they can always be procured in the ordinary course of business by those interested in any particular branch of trade. But our workmen cannot obtain the information they require by any other means than those afforded by International Exhibitions. A workman may occasionally see a specimen of foreign handicraft, but he has no particulars on which he feels he can rely of its cost or the mode of its production. It may be a specimen only shown to him to depreciate the value of his labour, and, by reason of this uncertainty, it is sure to excite his jealousy and prejudice against foreign workmen. He cannot know the real position it holds in the country where it has been made, or whether it fairly represents its available mechanical skill. This information he can only acquire by the examination of foreign labour in various stages and forms of manufacture, and where can he obtain such knowledge but at an International Exhibition? To him the comparison of manufactures from all countries, and of many different specimens from each, is invaluable. No Mechanics' Institution can give him such useful knowledge, no teaching in the Department of Science and Art can give him such instruction, as he will derive from a few hours spent in inspecting the work, in its various forms, of his foreign rivals. To the intelligent and skilful workman an International Exhibition is an industrial college, teaching in the most practical manner—educating the eye, the hand, and the taste, stimulating industry and ingenuity—removing prejudices, and, by enlarging the sphere of observation and giving new ideas, making better workmen.

The importance of this inspection is very strongly felt in France, not only, as I shall subsequently show, by the numbers admitted to the Exhibition in 1855, but by the arrangements now being made for the careful examination of every branch of industry at this Exhibition by working men. Independently of clubs to bring over numbers of working men cheaply, there is a special sum appropriated by the Imperial commission to pay the fares of deputies to be elected from the great body of each trade by their fellow-workmen.

Feeling, then, as strongly as I do the invaluable effect which the inspection of this Exhibition must produce on working men, I am led to ask if it can produce results of the same national importance on the upper classes. I think it cannot; nor is it necessary that it should. No doubt it will elevate the estimation of the manufacturer in the minds of many it amuses; surprise and excite wonder by the intrinsic beauty and exquisite workmanship of the articles exhibited, and by the wealth of which it gives such striking evidence; flatter the national vanity to see England's superiority in so many branches of industry; but where, among these classes, can it afford industrial instruction, or stimulate industry, or produce any permanent result calculated to maintain the supremacy of England's manufactures?

But when we turn to the middle and industrious classes we find, besides the pride they feel in common with all, in the collection of the world's industry, a high appreciation of the great benefits they must derive from the practical instruction they receive at these International Exhibitions. They prove their sincerity by providing the security on which the money is raised for the erection of the building—they supply it when erected with the wonderful collection it contains, and then, by their anxiety to inspect the works of all countries, of their rivals at home and abroad, find a large portion of the funds by which the expenses of management are to be paid.

In 1851, Season tickets, and 20s. and 5s. admissions, produced	£67,514
The 2s. 6d. admissions	72,447
And the 1s. "	221,271
In 1855, the 5fr. admissions produced	£6,735
2fr. " "	7,663
1fr. " "	83,904
4 sous " "	17,459

So that the working classes of Paris, at 4 sous each, paid more than the 5 fr. and 2 fr. admissions together, and besides being visited by more than 2,000,000 of people paying but 4 sous each, the Exhibition was open free on one Sunday before it closed, when a vast number were admitted

who would not otherwise have seen it. The numbers then admitted were enormous, but no account was taken of them.

I have drawn this comparison because I conceive it to be true and just, and necessary to illustrate the view I take of the proper mode of making the utmost use of these most valuable of modern institutions. Their object is undoubtedly to disseminate information among the great mass of master manufacturers and men in all countries, to improve their taste and stimulate their industry. Any arrangement which excludes the great body of those for whose benefit such institutions were inaugurated, is inconsistent with the broad principles of universality upon which they are based; such exclusion is in antagonism to the publicity which is demanded now-a-days in every sphere of action. It checks the operation of the principles of free trade, for what is the use of free trade by law, if, when we have the opportunity of teaching our workmen how to compete with their foreign rivals, we refuse to allow them to take advantage of it. Unless this is done, a demand is created for foreign works and our own producers are prevented from learning how to compete with them. You thereby injure the workman, the dealer, and the merchant.

Now, then, do I apply these observations to the present time? I say we open the Exhibition too many days in proportion to the rich, and too few to the workmen. We do not give to our workmen the advantages given to the French workmen. I believe in the low tariff to produce good pecuniary results. The penny postage stamp produces more than the eight-penny or shilling letter. I have greater faith in the realisation of a large sum by a low tariff than by a high one. I would not open the Exhibition every day at the lowest rate; but whilst, in the interest of science and of instruction, and I may say of fashion, I would have one day weekly at a comparatively high-rate of admission, and other days at one shilling for the general bulk of the visitors, I would devote certain days weekly to still lower rates, and as exclusively as possible to working men. Let them feel that an International Exhibition has a truly national object—that they are to derive benefit from it, and then they will learn to appreciate more thoroughly the sacrifice of time, the labour, mental and bodily, which have been required to bring such collections of industry together, and they will retire from the examination of these triumphs of skill and manufacturing industry better satisfied to contribute towards and to aid the exertions which are being made to improve general education, and to enter more fully into the importance and the utility of the large votes for educational and artistic purposes which every year pass the legislature.

GENERAL ITEMS.

MOLYNEUX ASYLUM, DUBLIN.—The new Molyneux Asylum and National Institution for blind females of Ireland, at Dublin, was opened last week. Accommodation is provided for about 100 blind females. The chapel, which will be opened to-day (Friday) will contain seats for 1,250 persons. The new asylum, it is calculated, will be supported thus:—£250 per annum will be derived from the interest of legacies to the old Molyneux Asylum; £300 yearly will probably be obtained from collections in the chapel, being $4\frac{1}{2}$ per cent. on the cost of its erection; and it is hoped that £1,500 will annually be subscribed by all Ireland for the support of the institution. The asylum is a handsome building, in the Tudor Gothic style of plain character, with high pitched roofs and gables, and dormer and mullioned windows. Granite is the material used, the window and door dressing being chiselled, and the general face of the walls of hammered stone. It has three floors. On the lower or basement floor are the kitchen, dining-room, laundry, and servants' apartments. On the ground floor are a day-room, a music-room, and a board-room; these three chambers being divided by folding doors, so as to admit of being thrown into one large apartment for Sunday school and other meetings, capable of accommodating 300 or 400 persons. To each room there is a distinct side entrance. The rest of this floor is occupied by the secretary's room, library, and matron's apartments. The upper or highest floor contains the dormitories, lavatories, and bath-room: also the infirmary, which has a distinct entrance from the main staircase, and is quite separated from the rest of the house. Mr. Rawson Carroll is the architect, and Mr. Bolton is the contractor for the works.

ANCIENT JERUSALEM.—According to the *Jewish Chronicle*, the foundation of the inner wall of Jerusalem has lately been discovered. As far as it has been laid bare it consists of very large stones, and the solid masonry is just the same as that of the western wall of the temple. It is about four yards distant from the present wall.

CURIOS DISCOVERY.—The other morning, while some workmen were engaged lowering the ground in a yard connected with Messrs. Southwell's factory, at Bridgnorth, they discovered the skeleton of a man in a most perfect state of preservation. It rested in a rude sarcophagus hewn out of the rock, and was evidently the remains of either a young man, or one in the prime of life, the teeth being perfect and regular. The vertebral column and the back ribs were perfect, as also were the arms, legs, and feet, but the front ribs had fallen in. This grim relic of a bygone age had, when in the flesh, been one of the order of Grey Friars, which was introduced into this country in the reign of Henry III., six hundred years ago.

BUILDING FOR MARINERS, AT MARGATE.—A committee has been formed, with the Archbishop of Canterbury as patron, to obtain the means of erecting, on a freehold site close to the pier, a building which on week days can be used as a reading-room, and on Sundays as a place of worship. The site has been purchased for £200, and it is estimated that another £500 will be required for the contemplated buildings.

ART UNION OF GREAT BRITAIN.—The fifth drawing of the Art Union of Great Britain is announced to take place in the Free Trade Hall, Manchester, on Saturday, June 28, when upwards of 1,000 works of art, including 250 paintings, will be allotted. We notice from the prospectus that 302,168 tickets were sold in the four previous drawings, and 4,200 prizes distributed, including 853 paintings, in amounts varying from £150 downwards, being one prize in each 71 tickets. Each purchaser of a shilling ticket has a chance for each of the prizes, and we would therefore recommend this institution to the support of the working classes, to whom it offers an opportunity of possessing a valuable painting or other work of art which they could not otherwise obtain.

THE ROMSEY EXHIBITION.—This interesting exhibition was finally closed last Monday week, when the *fête* at Embury Park very appropriately signalled its termination. Lectures have been given without intermission since the opening on the 25th of April.

THE STONE-CUTTING MACHINE.—The *Dundee Advertiser* states that a meeting of the Master Builders of Dundee was held there on Friday, at which the introduction of the stone-cutting machine was discussed very fully; and it being found that entire unanimity prevailed, a committee was appointed to make the necessary arrangements for the formation of an association to procure and work one or more of the machines in Dundee. The association, although it will be supported, no doubt, principally by builders, is intended to be wrought as a distinct concern, with a share capital, which will be employed not only in obtaining the necessary machines, but in purchasing and dressing the various kinds of stones employed in building in this quarter, of every variety of which a large dressed stock will be kept in hand, from which the builders may be supplied in any quantity. In Edinburgh, also, the master builders have resolved upon procuring several of the machines, which are manufactured by the Messrs. Munro, of Arbroath.

MONUMENT TO THE YOUNGEST DAUGHTER OF THE LATE SIR HENRY HAVELOCK, OF INDIAN RENOWN.—A tasteful monument has just been placed in the Dean Cemetery, Edinburgh, in memory of the youngest daughter of the late Sir Henry Havelock, K.C.B., who died in August last. The monument, which is the work of Mr. S. McGlashan, sculptor, Canonmills, has been erected by Lady Havelock.

THE CONSERVATIVE LAND SOCIETY IN NORTH ESSEX.—The forty-fourth purchase of this Society, and the first in the northern division of Essex, has just been made at Colchester. It is an excellent building property, situate just outside the town on its southern side, beyond the camp and Government barrack lands, and comprising five fields between the roads which there fork—the left leading to Aberton, and the right to Berechurch. A new branch railway, from the Stour Valley branch of the Eastern Union, is contemplated, having its terminus in the neighbourhood of St. Botolph's Church, which will greatly enhance this property for building purposes.

ANCIENT RELIC.—The editor of the *Falkirk Herald* states, that he has been shown a casting from an old stone which was discovered amongst the rubbish of the ruins of the parish church at Falkirk, immediately preceding the present one. The stone was discovered in 1810, and from the interesting description it bore, was sent to the British Museum in Edinburgh. Two castings from the stone were made at Carron by Mr. M'Luckie, now clerk in the Falkirk Iron Works. The inscription on the old stone (of which the casting is a *fac simile*) is as follows; "Hic funeratus D E Z N Rob Graham. Ille eversus vall Severus A.C. 415—Fergusius II., R. Sco;," and of which the following is a translation: "Here was interred (the thane) Robert Graham; he overthrew the wall of Severus, in the year 415.—Fergus II., King of Scotland.

ARCHITECTURAL EXHIBITION.—A lecture was delivered on Tuesday evening last week, at the Architectural Exhibition, Conduit Street, Regent Street, on "Conventionalism in Ornament," by Mr. J. P. Seddon.

LIGHTHOUSES IN THE RED SEA.—The works for the execution of lighthouses in the Red Sea, says the *Moniteur de la Flotte*, are being executed with rapidity. The *Zafarana*, situated in the Gulf of Suez, has been lighted since the beginning of January, and the *Ushrufee*, which is placed in the Jubal Strait, and the *Dedaley* on the rock of that name in the middle of the Red Sea, will be in use before the end of the present year. Those three lighthouses belong to Egypt, and are maintained at the expense of the Egyptian Government. The Peninsular and Oriental Steamship Company has undertaken to deliver by its vessels in passing the oil for lighting, and the necessary provisions for the keepers.

THE LIGHTHOUSE AT GREAT ORMSHEAD.—The works of excavation, construction of roads, raising of smithies and workshops, preparatory to the erection of a Lighthouse on the summit of the huge rock on the Great Orme, usually called "Y Pen Mawr," have been commenced. The site selected for this long-needed aid to navigation, is on the most northern point of the Gogarth promontory, and commands a view of Beaumaris Bay and Menai Straits, with the Anglesea coast, as well as the headlands of Flintshire, &c. As part of the mountain lies nearest the direction of vessels sailing up and down the borders, the danger has been much felt by the mariner, and hence the necessity of proper lights and signals for protection against wrecks and damage, especially when the heavy sea peculiar to the place, at certain tides, becomes uncontrollable, and breaks against the rock with much fury. The spot is a little below the walk round the Head, near the half-way mark, on the east side. When completed, of course, it will be an edifice of much attraction and interest to the public.

METROPOLITAN BOARD OF WORKS.—A meeting of the Metropolitan Board of Works was held at the offices, Spring Gardens, on Friday last, Mr. Alderman Lawrence in the chair. On the motion of Mr. Dixon (member for Limehouse) it was ordered "That it be referred to the Committee of

the whole Board on the Covent Garden Approach, and Southwark and Westminster Communication, who are already authorised to put in force the powers in the Victoria Park Approach Act, 1858, necessary for obtaining possession of the property required for the formation of the Victoria Park Approach, reporting their proceedings from time to time to the Board (all warrants upon the treasurer, for the payment of moneys under such reference, being signed by nine members of the Committee), to consider the great advantage of purchasing, for the sum of £200, four lots of freehold building land, adjacent to a very narrow slip of frontage belonging to the Board in the Victoria Park Approach, which would not only improve the road, but likewise recoup the Board to the amount of from £400 to £600 of the £750 paid to Mr. William Sykes."

MINT AT CALCUTTA.—Considerable progress has been made with the building for the new Mint at Calcutta. The walls have reached the height to which it was intended to carry them, and part of the roof is completed. The machinery, which was constructed by James Watt and Co., of Soho, near Birmingham, has all reached its destination, and the boilers are already set. Two steam engines of 40-horse power each are intended to propel the rolling mills, cutting-out machines, and stamping-presses, of which latter there will be twelve. There are in all five boilers, on the Cornish principle. These are each 30 ft. in length, and 7 ft. in diameter. There are two flues of 2 ft. 6 in. diameter, running longitudinally through each boiler. So admirable will be the arrangements of the new Calcutta Mint, that it will undoubtedly form, when completed, the most perfect establishment for coining money in the world. There is already, and has been for many years, one mint in the capital of Bengal, of considerable productive power, but this will probably be devoted, after the new mint shall have been started, to the copper coinage only. The new establishment will be in that case employed exclusively in the creation of gold mohurs, and silver rupees, with their smaller relative denominations of coin.

On Monday last, a meeting of the Inventors' Institute was held at the temporary offices, 26, Great George Street, Westminster, when the rules and regulations of the Society were agreed to. Its objects are:—1. To protect inventors' interests, and defend the privilege of obtaining letters patent. 2. To promote improvement in the patent laws. 3. To facilitate the diffusion of information in reference to inventors and other subjects beneficial to inventors and patentees. A subcommittee was formed to complete the organisation.

PRITCHARD MEMORIAL.—The fund collected at Broseley, Bridgnorth, and the neighbouring parts of Shropshire, amounting to nearly £3,000, is to be devoted to two distinct objects, in memory of the late Mr. Pritchard, high-sheriff of the county. Firstly,—In the erection of a memorial church, at Jackfield, near Broseley, for which a design by Mr. Blomfield, architect, of London, has been selected in competition. Secondly.—Designs have also been invited for a memorial building, to be erected in the centre of Broseley, over a well and reservoir that have lately been constructed for the purpose of supplying the town with water. The first premium of £20 has been awarded to Mr. R. Griffiths, architect, of Bridgnorth. A second premium of £5 was also unanimously awarded to Mr. W. Thursfield, of Broseley, accompanied by a vote of thanks from the Memorial Committee, "for the time and attention he has given to the preparation of the admirable set of Working Drawings for the Memorial Building."

SOUTH KENSINGTON MUSEUM ART OBJECTS EXHIBITION.—A private view of the "SPECIAL EXHIBITION OF LOANS OF ART OBJECTS" took place on Tuesday, at South Kensington, and was well attended. The show is such a good one that, despite the counter attractions of the International Exhibition, it will probably always draw a large number of visitors. Her Majesty has lent some excellent porcelain vases; Baron Lionel de Rothschild sends a complete case; and a host of the best-known names in England are represented by articles of more or less interest. There are massive golden shields, and china cups; as well as majolica ware, ornolu, and marqueterie. An infinite variety of objects, indeed, is the chief characteristic of the display—drinking-cups, vases, match-boxes, spoons, caskets, tankards, teapots, coloured glasses. We might reprint some pages of the Industrial Catalogue, and yet fail to give an adequate idea of the articles here collected. Of course, many of them are merely interesting, either for the value of the material or the quaintness of the design; but on the whole they are really beautiful. Among those who have kindly lent *objets d'art* are most of the prominent members of the aristocracy; and the list of contributors also includes the names of public corporations and of the universities.

THE FLOOD IN THE FEN DISTRICTS.—It appears that, unless some unfortunate catastrophe should occur, the inundations in the fen districts of Norfolk have reached their utmost limits. The high tides have passed without the eastern bank of the drain giving way, so that the districts opposite to those that are under water have thus far escaped the calamity with which they were threatened; and the speedy completion of the cofferdam will, it is believed, effectually stop the progress of the flood, and form a barrier against the attacks of the sea water. This work is being prosecuted with great activity and success.

MEMORIAL TO THE LATE PHILANTHROPIST, DR. ANDREW REED.—Shortly after the demise of this divine and philanthropist, a suggestion was made that a monument should be erected over his grave by the young men and women educated in the various orphan asylums of which he had been the founder. On application to his family, they very readily consented to the proposal, and arrangements were in progress to this end, when a very pleasant incident occurred to alter the form of the project. Some

members of the Board of Management of the London Orphan Asylum (the first of Dr. Reed's institutions, but one from which conscientious differences had caused his retirement) heard of the proposal, and suggested that the chapel of the asylum at Clapton was the most suitable place for a memorial from such a source, and they offered to erect a tablet, if that should be desired. As all the promoters of the scheme, and all who had contributed, were London Orphan Asylum ex-boys, this arrangement was gladly entered into. Mr. Felix Miller, sculptor, an old London Orphan Asylum pupil, has undertaken the execution, in white marble, of an emblematical design for a tablet, in bas-relief, representing, in full length figures, a widow seated with two young children at her side, and Dr. Reed in the act of handing to the children, with one hand a book, and with the other bread — education and maintenance. The expense will be considerable, but there will, doubtless, be no lack of funds for the purpose.

THORPE MALSOR.—A beautiful stained-glass window has been recently placed in the picturesque little church of Thorpe Malsor. It is intended as a memorial of the late Hon. Caroline Eliza, wife of T. P. Maunsell, Esq., and mother of the late Recorder of Stamford. The four principal lights represent the Nativity, the Crucifixion, the three Marys, and the Ascension. Above these are four smaller lights, which contain symbols of the four Evangelists. These are surmounted by two angels bearing scrolls, and by an emblematical representation of Christ in Glory. The whole presents a rich appearance, strangely at variance with the rude appearance of the pews and other portions of the edifice. Underneath the window is a band formed of glazed encaustic tiles, on which are inscribed "In memory of the Hon. Caroline Eliza Maunsell, who died March 14th, 1860, aged 73." The letters are yellow and white on a chocolate coloured ground, edged with a yellow line, and bordered with green. The whole was designed and completed by Messrs. Ward and Hughes, of Frith Street, London.

HASTINGS MEMORIAL TO THE LATE PRINCE CONSORT.—The meeting of the subscribers for the purpose of finally selecting the design for a proposed clock tower at the Priory, Hastings, as a local memorial of "Albert the Good," has been held, and out of thirty-seven designs, one sent by Mr. Edward Heffer, of Liverpool, was chosen, and a guarantee given that the cost of erection should not exceed £500. It is to be built of Bath stone in the late period of Gothic architecture, height of clock chamber 30 ft., total height 65 ft. Above the entrance and side panels, in quatrefoils, is introduced the arms of Hastings, cut upon appropriate shields; above the gable, inserted into a niche, a statue six feet high, of the late Prince Consort, in his robes as Chancellor of the University of Cambridge; and in the panels below the dials, the arms of Saxe Coburg and Gotha. The dials are to be inserted in an octagon, giving variety to the lines in the composition; and on one side of the tower a granite basin for a drinking fountain is proposed.

THE EUROPEAN ASSURANCE SOCIETY.—At the last annual meeting of this Society, Mr. H. W. Wickham, M.P., in the chair, the report stated the policies issued during the past year to have produced £13,674 in new premiums; that the total amount of premiums received was £130,087; and that the assets had been increased £40,437; also, that in the Fidelity Guarantee Branch the balance carried over upon the year's operations was £6,431.

CIIPS.

TWO new rooms have just been opened in the Museum Napoleon III., at the Palais de l'Industrie, Paris. They contain the objects obtained by Mr. Ernest Renard, during his mission in Phœnicia. The contents of the first room comprise sixteen magnificent sarcophagi in white marble, and almost all intact, a quantity of jewels, in gold and precious stones; bronzes, glass, pottery, inscriptions, and fragments of monuments in marble, stone, and lava. In the second room is placed an enormous mosaic, 33 ft. long, and about 20 ft. wide, found at Djebet. It is divided into square compartments, containing representations of human heads of almost natural size, and figures of animals and fish. A very wide and handsome foliage forms the border.

A large number of masons and other workmen are employed in the erection of the Royal Mausoleum in Frogmore gardens, destined to receive the ashes of the late Prince Consort. The base of the structure is nearly completed, and scaffolding of 100 ft. in height is in course of construction, for raising and depositing the heavy blocks of stone. Accommodation will be afforded within the Mausoleum for nearly 100 coffins.

In quarrying what is called the Black Rock for building stone, for the formation of portions of the Severn Valley Railway, an interesting discovery has just been made. The rock is one of the sand-rocks belonging to the lower coal measures, which in this locality are known to be rich in the fossil flora of the carboniferous period, and during last week the workmen have exposed to view a fossil tree of large dimensions. It is eight feet in circumference, and stands perfectly upright. It is probable there are eight roots, although five only have as yet been uncovered. Each root is 2 ft. 10 in. in circumference, and each at a distance of eighteen inches from the trunk divides into two. These strike down into a yellowish shale or underclay. The tree appears to have decayed down to within thirteen inches of the root, for there is a clear impression of a branch which had fallen across. Another tree is now being uncovered within a few feet of this one. This is also of large proportions, and on the same coal. The rock for nine feet above is full of other fragments, and smells strongly of petroleum, with which it is strongly charged. Above this rock is a seam of coal twenty-one inches thick, and above that a whitish clay.

On Friday morning a party of navvies commenced sinking a shaft at the western end of the proposed site for the goods station under the intended dead meat and poultry market at Smithfield.

The next congress of the Archaeological Institute of Great Britain will be held at Worcester, July 22nd. A special exhibition has been formed of specimens of enamel and niello, which will be open to the 14th inst.

A scaffolding has just been erected at the west front of York Minster, for the purpose of easing the magnificent decorative window with plate-glass. Opinions differ as to the policy of this proceeding, but the ostensible object is to protect the beautiful stained glass.

The new bank to be erected in the market-place of Spalding, Lincolnshire, on the site of the shop lately occupied by Mr. John Cave, is to be constructed by Mr. Sneath, of Baston, his contract for the building having been accepted by the Board of Directors. The amount is £2,067. The building is to be handed over to the directors by the end of December next.

An application has been made on behalf of the proprietor of a novel style of tram or street railway, to the Marylebone council, for permission to lay down, as an experiment, 100 yards in Oxford Street or some other public thoroughfare. The principle is said to be in operation in Salford, near Manchester, and obviates the objections of Mr. Train's tramway, no trams being above the surface, and the carriages kept steady by a lifting centre wheel, running in a centre groove.

The opening of the line of railway known as the Colne Valley Railway Extension, between Hedingham and Yeldham, Essex, took place last week under the most auspicious circumstances.

The council and members of the Institute of Civil Engineers, and several scientific men of eminence, at the invitation of Mr. Bazalgette, engineer to the Metropolitan Board of Works, paid a visit of inspection to the Northern Outfall Sewer, in connection with the Main Drainage, on Saturday. About eighty gentlemen attended, among whom were Captain Vetch, R.E., Professor Donaldson, Alderman Rose, Dr. Arnott, Mr. Scott Russell, Mr. W. Haywood, Mr. Joseph Cubitt, Mr. Bunning (city architect), Mr. Vulliamy (superintending architect to the Metropolitan Board of Works), Dr. Letheby, Mr. R. P. Brereton, and Mr. Furness, contractor of the work.

The Metropolitan (Underground) Railway was inspected on Saturday by the Chancellor of the Exchequer and his lady, and about twenty of the nobility. The inspection was commenced at Paddington, and continued to Victoria Street, Clerkenwell. At Euston Square the visitors were received by Mr. Jay (contractor), Mr. Cordell (manager), Mr. Fowler (engineer-in-chief), and Mr. Johnson (resident engineer).

The iron-work outside the great dome of St. Paul's Cathedral has been painted with Messrs. Peacock and Buchan's composition for the preservation of iron.

A young sculptor, Mr. George Maccallum, has just completed a model, in clay, of a statuette of the late Principal Cunningham, of Edinburgh; which, with the pedestal, stands about two feet high. The principal is represented in the moderator's dress, sitting with legs crossed. He holds a book in his left hand, and his right arm is thrown carelessly over the back of the chair. The attitude is easy and natural, and the likeness very characteristic and truthful.

An elegant and extensive suite of rooms has been recently erected as a Soldiers' Home or Club-house, for the military stationed at Chatham garrison.

A drinking-fountain of a handsome character has just been opened at Hastings. The cost, about £200, was defrayed by public subscription — voluntary in every respect, as no person was asked to give — and it was raised as a testimonial to the worth of the Countess of Waldegrave. The fountain adjoins the Holy Trinity Church, Robertson Street, with which edifice it is in keeping, and is eighteen feet high, erected of Portland stone. Three sides of the basement are inscribed panels, and beneath the panels are the jets and basins; and an open canopy, supported on four granite pillars, covers a sculptured group of our Lord and the Woman of Samaria. Figures at the corners, outside the pillars, represent the four evangelists; and the monogram, "I H S," is carved on the drapery of the canopy.

The first drinking-fountain in Durham was opened a few days ago. The fountain was erected by Mr. Joseph Taylor, and is situated at the bottom of Elvet Bridge leading to the baths and washhouses — a very convenient spot. It is of a neat and elegant design. The front is composed of bronzed metal, surmounted by the Queen's head in bas-relief, with wreathed figures on each side.

On Monday morning the North London Railway opened a branch to Kensington in connection with their line. A number of trains run direct from Bow to Kensington, stopping at all intermediate stations, accomplishing the entire distance in a little under an hour.

A return just issued shows that of the £2,000,000, as the first instalment towards the expense of coast fortifications authorised to be raised by loan by the Act of 1860, £989,000 have been actually expended up to the present upon works and land, and that purchases of land have been made involving further liabilities to the amount of £695,000, thus leaving a balance of £316,000 unexpended. The amount of contracts which have been entered into for works of fortifications, up to the present date, is £5,680,000, including £1,220,000 for completing works in progress before the passing of the act; and the estimated cost of the land to be paid for is £1,030,000. These fortifications comprise seventy-one distinct works, and are to be constructed at Portsmouth, Isle of Wight, Plymouth, Pembroke, Portland, Gravesend, Medway and Thames, Chatham, Dover, and Cork.

In the House of Commons on Tuesday night, Mr. B. Cochrane gave notice, that on an early day he would call the attention of Her Majesty's Government to the state of the Chapter House at Westminster.

Those who have so often laughed over the productions of Mr. Leech, have now an opportunity of seeing his life-like sketches reproduced in oil colours, and on a greatly increased scale. The present series consists of sixty-five pictures, selected from the more recent numbers of *Punch*; and on the walls of the Egyptian Hall may be seen specimens of the "Swell," the street boy, the modern young English lady, and that parental type "Paterfamilias," painted in a bold effective manner, the character of the original sketches being in most cases excellently preserved.

The annual dinner of the Architectural Association will be held in the Whittington Club, Arundel Street, on Wednesday evening next.

The annual conversazione of the Institute of British Architects will be held on the 25th instant.

The arrangements for the great social science Congress are now complete. The proceedings were opened by a special service in Westminster Abbey, on Wednesday, when the Dean of Chichester preached. The members assembled in the Jerusalem Chamber previous to the service, and proceeded in a body into the Abbey. The opening meeting was held in Exeter Hall in the evening, when the president, Lord Brougham, delivered the address. To day the departments will assemble at Guildhall, at 11 o'clock, for the reading of papers and for discussion. The evening discussions at Burlington House on subjects of special interest are arranged as follows:—Friday, June 6—Education Department, National Education; Trade and International Law Department, Belligerent Rights. Monday, June 9—Punishment and Reformation Department, Convict System; Social Economy Department, Habitations of the Working Classes. Tuesday, June 10—Education Department, Middle-class Examination; Public Health Department, Effect of Occupations on Health. Wednesday, June 11—Workhouse Visiting Society, Report of Society. Lord Lyttelton will take the chair. Thursday, June 12—Jurisprudence Department, Marriage Laws of the United Kingdom; Public Health Department, Sanitary Statistics. Tickets for the entire meeting can be obtained at the offices, at 12 Old Broad Street, and Guildhall; and also special tickets, for ladies only, for the grand *soirée* in the Palace at Westminster on Saturday evening.

TENDERS.

WEST KENT INFIRMARY, MAIDSTONE.

For alterations and new wing to the West Kent Infirmary, Maidstone; Mr. Henry Blandford, architect.

Girmstead and Bridge.....	£4,182 0 0	Cobb.....	£3,582 0 0
Sutton and Vaughan.....	3,447 0 0	Chambers.....	3,340 0 0
Anscumb.....	3,401 0 0	Naylor.....	3,293 0 0
Clements and Wallis.....	3,386 0 0		

The tender of Mr. Naylor, of Rochester, was accepted.

WORKS AT ABNEY CHAPEL AND SCHOOLS.

Mr. John Tarring, architect, Bucklersbury.

Woodward.....	£1,611 0 0	Dove, Brothers.....	£1,497 0 0
Little.....	1,589 0 0	Richards.....	1,479 10 0
Wood.....	1,577 0 0	Saunders.....	1,428 18 0

CATTLE MARKET, COLCHESTER.

For the construction of a shed and other works, to complete the market.

Orrin.....	£317 0 0	Everitt.....	£304 10 0
Shepherd.....	303 18 0	Dobson.....	287 0 0
Hum.....	300 10 0	Lee and Baker.....	279 0 0

The lowest tender was accepted, and the whole work is to be completed by Saturday, 5th July.

TUNBRIDGE WELLS.

For a detached villa residence, with conservatory, &c., Tunbridge Wells, for Captain Bingham, R.N. Mr. W. Bond, architect. Quantities supplied by Mr. Charles M. Strang.

Grover.....	£1,592 4 0	Messrs. Pink.....	£1,534 0 0
Perigo.....	1,561 2 0	Walker.....	1,505 5 3
Mercer and Canfield.....	1,550 0 0	Edwards and Walking.....	1,428 8 11

WORMLEY, HERTS.

For building a new south aisle to St. Laurence's Church, Wormley, Herts. Mr. Joseph Clarke, F.S.A., architect, 13 Stratford Place, W.

Mr. G. F. Arnold.....	£248 0 0	Mr. Hunt.....	£651 0 0
Mr. J. W. Barnes.....	721 5 5	Messrs. Bowley, Brothers.....	646 0 0
Mr. Smith.....	680 0 0	Mr. Cousins.....	516 0 0
Mr. Dickinson.....	655 0 0		

LEICESTERSHIRE.

For rebuilding a portion of the tower and spire of North Kilworth Church, Leicestershire. Mr. Joseph Clarke, F.S.A., architect, 13 Stratford Place, W.

Mr. J. Bromwich.....	£614 0 0	Mr. J. Law.....	£385 0 0
Messrs. Bowley, Brothers.....	570 0 0	Mr. J. Finn.....	370 0 0

WORMLEY, HERTS.

For building new schools and master's residence, at Wormley, Herts. Mr. Joseph Clarke, F.S.A., architect.

H. W. Dickinson.....	£1,125 0 0	Hunt.....	£1,075 0 0
J. W. Barnes.....	1,121 0 0	Bowley.....	1,050 0 0
Cousins.....	1,118 0 0	Arnold.....	928 17 6
Smith.....	1,080 0 0	Nicholls.....	800 0 0

JOHN ADDEY'S CHARITY ESTATE, DEPTFORD.

For alterations and additions to house and schools for the trustees of John Addey's Charity Estate, Deptford; Mr. Joseph Liddiard, architect.

T. O. Todd.....	£1,800 0 0	T. Rodkin.....	£1,525 0 0
B. Stone.....	1,649 0 0	H. George.....	1,431 0 0
J. and F. Coleman.....	1,584 0 0	J. Walker.....	1,420 0 0
H. and C. Bird.....	1,565 16 0	W. T. Hunt.....	1,385 0 0
C. Hudson.....	1,539 0 0	J. and T. Todd.....	1,375 0 0
A. J. Smith.....	1,530 0 0	W. Pearson.....	1,355 10 0

ST. JOHN'S CHURCH, BATTERSEA.

Mr. E. C. Robins, architect.

Marsland and Son.....	£3,250 0 0	Nicholson.....	£2,980 0 0
Newman and Mann.....	3,115 0 0	Maers.....	2,973 0 0
Brass.....	3,075 0 0	Dove.....	2,867 0 0
Lathey.....	2,987 0 0	Sharpington and Cole.....	2,847 0 0

NATIONAL SCHOOLS, ISLINGTON.

For the erection of new girls' and boys' National Schools and class rooms for the district parish of St. Paul, Islington. Messrs. H. and J. D. Mathews, architects, 10 Cloak Lane, City. Quantities supplied.

Foranores.....	£1,215 0 0	Foster.....	£169 0 0
Rudda.....	1,150 0 0	Nash.....	967 0 0
Hanney.....	1,120 0 0	Hill and Son.....	945 0 0
Fox.....	990 0 0		

The above include the value of the old materials of the present buildings.

PUBLIC PARKS, SOUTHAMPTON.

For laying out ground in the public parks, Southampton. Messrs. Guillaume, Parnento, and Guillaume, architects and surveyors.

Cox.....	£100 0 0	Croft.....	£98 0 0
Hewitt and Beaman.....	100 0 0	Barnes (accepted).....	92 0 0

HAVELOCK ROAD, SOUTHAMPTON.

For making "Havelock Road," through the Macland's Park. Messrs. Guillaume, Parnento and Guillaume, architects and surveyors.

Croft.....	£104 10 0	Barnes.....	£97 10 0
Hewitt and Beaman.....	102 0 0	Cox (accepted).....	95 0 0

PREMISES, HIGH STREET, SOUTHAMPTON.

For alterations to the premises No. 3, in the High Street, Southampton, for Mr. E. M. Passenger. Messrs. Guillaume and Co., architects.

Scott.....	£279 0 0	Adams (accepted).....	£254 0 0
------------	----------	-----------------------	----------

COTTAGE, SOUTHAMPTON.

For erecting a cottage on the Belle-Vue Estate, for Mr. G. Calnes. Messrs. Guillaume, architects.

Evans.....	£230 0 0	Philps (accepted).....	£197 0 0
------------	----------	------------------------	----------

MANSION, NEAR TOTTON.

For erecting a mansion near Totton, without offices, &c., for W. F. Wingrove, Esq. Messrs. Guillaume, Parnento, and Guillaume, architects.

Scott.....	£5,267 0 0	Gambling.....	£4,650 0 0
Phillips.....	5,175 0 0	Bull (accepted).....	3,983 0 0
Fletcher.....	4,935 0 0	Adams.....	3,785 0 0
Stevens.....	4,897 0 0		

SHOP AND RESIDENCE, SOUTHAMPTON.

For building a shop and residence in the Above-Bar Street, Southampton, for A. Andrews, Esq. Messrs. Guillaume, Parnento and Guillaume, architects.

Blackman.....	£1,562 0 0	Bull (accepted).....	£1,046 0 0
Philps.....	1,222 0 0	Martin.....	1,000 0 0
Adams.....	1,192 0 0	Evans.....	600 0 0
Bailey.....	1,050 0 0		

A LODGE, MUSWELL HILL.

For erecting a lodge at Fortis Green, Muswell Hill, for Mr. H. Smith. Mr. F. G. Widdows, architect.

Langmead.....	£450 0 0	Jeffs.....	£350 0 0
Flint.....	418 0 0	Plowman.....	333 0 0
Greenwood.....	375 0 0	James and Ashton.....	323 10 0

STABLING, BAYSWATER.

For the erection of stabling, Westbourne Grove, W., Bayswater. Mr. W. Sim, Dane' Inn, architect.

Fish.....	£470 0 0	Cooper.....	£379 0 0
Cowland.....	391 0 0		

THE CITY.

For the erection of three warehouses in Bow Lane and Watling Street, City, for William Vivian, Esq. Tillott and Chamberlain, architects. Quantities supplied.

Turner and Sons.....	£3,979 0 0	Wills.....	£3,497 0 0
Laurence and Son.....	3,740 0 0	Brass.....	3,465 0 0
Fish.....	3,697 0 0	Cannon.....	3,393 0 0
Piper and Wheeler.....	3,553 0 0	Ashby and Sons (accepted).....	3,358 0 0

VILLA, BENWELL.

Tenders for a new villa at Benwell Park, for Mr. Joseph Carr. Mr. J. E. Watson, architect, Newcastle Square.

Masonry and Carpentry— W. Gibson (accepted).....	£1060 0 0	J. & W. Gibson.....	£1187 0 0
E. B. Reed.....	1074 0 0	Scott & Reed.....	1170 0 0
Masonry— Thomas March.....			£564 16 0

Carpentry—
Bornup..... £398 6 0 | Waite & Howard..... | £550 0 0 |

Dobson.....	565 12 0	Cowsay.....	536 0 0
Slating— Beck (accepted).....	£24 0 0	March.....	£85 10 0

Plumbing, &c.—
Gibholm (accepted)..... £100 0 0 | Scott & Reed..... | £92 15 0 |

Plastering—
Wilkinson (accepted)..... £156 0 0 | Mead..... | £157 0 0 |

March..... 170 8 0 | Scott & Reed..... | 144 11 3 |

Painting & Glazing—
Cawson (accepted)..... £87 10 0 | Gibson..... | £115 6 0 |

Richardson & Co..... 96 0 0 | R. Richardson..... | 118 12 0 |

COMPETITIONS OPEN.

CHURCHES.

HOLYWELL, NEAR ST. IVES.—For the restoration of Holywell church, near St. Ives, Hants. Plans, &c., may be seen at the office of Mr. Hutchinson, architect, Market Place, Hantsington, who will receive tenders to June 10.

SOUTHAMPTON.—The churchwardens and church committee of St. Mary's, Southampton, are desirous to receive tenders for cleaning, colouring, painting, and repairing the parish church. Specifications may be seen at the vestry, on application to Mr. Bromley, the sexton, St. Mary's Street, on and after Monday, June 2. Tenders to be forwarded to Mr. R. E. Page, 95 St. Mary's Street, on or before Saturday, June 14.

LEAMINGTON.—Plans and estimates, in sections, are required for the completion of the parish church of Leamington. The nave, the chancel, and the north transept being already built, it is intended to proceed to erect the remaining portions of the work in sections. Architects are invited to send in plans and estimates, for erecting the south transept, the vestry, the lantern tower, and the bell tower; which it is intended to build in strict harmony with the architectural style of those portions of the church now erected. Increased accommodation in the church is most desirable. A premium of £20 will be given for the best set of plans and estimates in the opinion of the Committee, which must be sent, sealed and under motto, to Mr. G. Rogers, Newbold Street, Leamington, on or before the 21st June, of whom all further particulars may be obtained.

FARMHOUSE, ETC.

HEAVITREE, DEVON.—For the erection of a farmhouse and buildings at Heavitree, in the county of Devon. Plans and specifications at the offices of Messrs. Geare, Mountford, and Geare, Queen Street, Exeter. Tenders, endorsed "Tender for farmhouse and buildings at Heavitree," to be sent to Messrs. Geare, Mountford, and Geare on or before June 14.

ASYLUM.

FAREHAM, HANTS.—For enlarging two day rooms at the County Asylum, Fareham. Plans and specifications at the office of the County Surveyor. Tenders, endorsed "Tender for enlarging day rooms, County Asylum," to be sent to Mr. Thomas Stopher, County Surveyor, on or before Friday, June 13.

HARBOUR.

SOUTHAMPTON.—For taking down and rebuilding a portion of the watergate, quay wall, timber piling, &c., of Southampton harbour. Plans and particulars may be seen at the office of the surveyor, Mr. Geddes, Above Bar Street, and tenders to be delivered at the clerk's office, 3 Lower Bugle Street, on or before Saturday, June 14.

PAINTING.

LITTLEPORT.—For painting the timber bridge across the River Ouse, at Littleport. The specification of the work may be inspected on application to Mr. John Ellingham, at the Bridge House Inn, Littleport, or at the office of Mr. R. Reynolds Rowe, Surveyor General of Bridges, &c., in the Isle of Ely, 10 Emmanuel Street, Cambridge. Tenders to be delivered at the office of the Clerk of the Peace, Wisbeach, on or before Tuesday, June 10.

VILLA.

GRESFORD.—For the erection of a villa at Gresford, near Wrexham, in the county of Denbigh. Drawings and specifications at No. 12 Temple Row, Wrexham. Tenders to be delivered on or before Monday, June 16, endorsed "Tender for villa at Gresford," to Mr. Gummow, surveyor, Wrexham.

OFFICERS' QUARTERS.

SANDHURST.—For the erection of additional officers' quarters at the Hospital, Royal Military College, Sandhurst, Berks. Parties desiring to tender for the erection of these works must leave their names at the Royal Engineer Office on or before the 13th day of June, and pay the sum of 10s. 6d. for the bills of quantities, which will be forwarded to each party as soon as prepared by the government surveyor.

STAFF SERJEANTS' QUARTERS.

FLEETWOOD.—For the erection of staff serjeants' quarters, Fleetwood. Parties desiring to tender for the adoption of these works must leave their names at the Royal Engineer Office, 225 Stratford Road, Manchester, on or before the 9th of June, and pay the sum of 10s. 6d. for the bills of quantities, which will be forwarded to each party as soon as prepared by the government surveyor.

BARRACKS.

HOUNSLOW.—For alterations to the west wing of Hounslow Barracks. Parties desiring to tender for this work must leave their names at the Royal Engineer Office, London District, 11 James Street, Buckingham Gate, from 11th to 14th of June, both days inclusive, between the hours of 11 a.m. and 3 p.m., and to pay the sum of 10s. 6d. for the bills of quantities, which will be forwarded to each party as soon as prepared by the government surveyor.

PIER.

FORT VICTORIA, FRESHWATER, ISLE OF WIGHT.—For the erection of a new wooden pier at Fort Victoria, Freshwater, in the Isle of Wight. Parties desiring to tender for this work must leave their names at the Royal Engineer Office, Hill Lodge, Freshwater, on or before the 10th of June.

RAILWAY STATIONS.

DUMFRIESSHIRE.—For the erection of the following stations on the line of the Dumfries, Lochmaben, and Lockerby Junction Railway:—1. A station house, goods' shed, pointsman's box, and other works at Lochmaben. 2. A station house at Shieldhill, in the parish of Tinwald. 3. A station house at Amisfield, in the parish of Tinwald. Plans, specifications, and schedules of measurement may be seen at the office of the Secretary of the Company, English Street, Dumfries, and tenders received till Wednesday, the 18th day of June.

PUBLIC-HOUSE, ETC.

ANCASTER.—Plans and specifications of a public house, stable, and cart-shed, to be erected on ground near the railway station, Ancaster, may be seen at the offices of Kirk and Parry, Sleaford, Lincolnshire. Tenders, addressed to Mr. John Newton, care of Kirk and Parry, Sleaford, to be delivered not later than noon on Monday, June 9.

HOSPITAL.

PATH.—For making alterations in the Bath Mineral Water Hospital. Plans and specifications at the offices of Messrs. Manners and Gill, architects, Bath. Tenders, either for the whole of the work, or for one or more of the separate trades, to be sent to the architects by one o'clock on Monday the 16th of June.

IRONMONGERY, ETC.

BRIGHTON.—For the general and usual supply of ironmongery, bricklayers' and carpenters' materials, and for the performance of plumbers', painters', and glaziers' work required at the Brighton Workhouse, Industrial Schools, and Parochial Offices, for one year, commencing the 25th day of June 1862, and ending the 24th day of June 1863. Tenders to be left at the clerk's office, parochial office, Church Street, Brighton, on or before Tuesday, the 17th of June.

CATHEDRAL.

CORK.—Architects are invited to furnish designs for the erection of the cathedral of St. Finbar, Cork, at a cost not exceeding £15,000. A premium of £100 will be given for the best and most approved plan, and £50 for the second. Plans and designs to be sent to the hon. secretaries, Ven. the Archdeacon of Cork, Rev. J. N. Woodroffe, or T. M. Osborne, Esq., Cork, not later than the 1st of August next. Further information and a plan of the site may be obtained on application to W. C. Bennett, Esq., notary public and Chapter clerk, 15 South Mall, Cork.

LIBRARY AND READING ROOMS.

BIRMINGHAM.—The Free Libraries' Committee of the Council of the Borough require plans, sections, specifications, and estimates for the erection of a free reference library and reading-rooms, lending-library and news-rooms, and gallery of art, upon the piece of

vacant land adjoining the Midland Institute Building, with an elevation uniform with the said building. Intending competitors are requested to send in their plans, specifications and estimates, under cover, to Thomas Standbridge, Town Clerk, Town Clerk's Office, Temple Street, endorsed "Plans for Free Reference Library Buildings," on or before the 16th June. Particulars of the accommodation required, and of the conditions of competition, together with a lithographed plan of the site, may be obtained on application.

MEMORIAL.

GLOUCESTER.—The committee appointed to carry out the Hooper Memorial, at Gloucester, invite sculptors to submit models of designs for the figure of Bishop Hooper, which is intended to be placed under the canopy of the monument just erected in the churchyard of St. Mary de Lode, Gloucester. The models or statues to be carved in stone, and to be one quarter the real height (7 feet). The author of the best design, approved by the committee, will be appointed to execute the full-sized figure, and the sum of ten guineas will be awarded for the second-best design.

WORKHOUSES.

CARLISLE.—The Guardians of the Carlisle Union offer a premium of £50 for the set of plans approved by them and the Poor Law Board, for a new workhouse, capable of accommodating 500 adult inmates, and designed in such a manner as to allow of enlargement, without interfering with the uniformity of the external appearance. The site for the erection of the said workhouse is situated at Fuschill, on the east side of Carlisle. All plans to be sent to the Clerk on or before June 23.

DORRINGTON.—For executing certain additions and alterations proposed to be made at the union workhouse, Dorrington, North Whiteford Union, according to plans and specifications lying for inspection at the workhouse. Tenders to be delivered to the Clerk of the Board, on or before Tuesday, June 10.

HANTS.—For the works required to be done in making certain alterations in, and additions to, the Alverstoke Workhouse. Plans, &c., at the Board-room of the workhouse on and after the 15th May, or at the office of Mr. Thomas Hellyer, Bouvierie House, Ryde, Isle of Wight, architect, of whom every information may be obtained, and bills of quantities may be had.

GAOL AND HOUSE OF CORRECTION.

EXETER.—The Town Council of Exeter are desirous to be informed if the present City Gaol and House of Correction can be made available so as to satisfy the requirements of the law, as to the construction of gaols and houses of correction; and they invite architects to ascertain if it is practicable that the present City Gaol and House of Correction can be so altered. They offer a premium of £30 for the plan of alterations which shall be considered the best, and if such plan be carried into effect, the architect producing it will be employed to superintend the execution of the work at the usual commission, but in that event his premium is to merge in his commission. A premium of £20 will be given for the plan which shall be considered the second best. Plans to be sent in before the second Wednesday in June.

CONTRACTS OPEN.

METROPOLITAN MAIN DRAINAGE.

SOUTHERN OUTFALL WORKS, CROSSNESS.—For the construction of engine-houses, a boiler-house, chimney, filth-hoists, coal-sheds, dwelling-houses, wharf-wall, sewers, and other works in connection therewith, at Crossness, Erith, Kent. Plans, &c., may be obtained at the Metropolitan Board of Works office, Spring Gardens, until 3rd July. Tenders to be sent in on 4th July.

CHAPEL.

USK, MONMOUTHSHIRE.—For the erection of a new chapel and vestries on the site of the present Congregational chapel at Usk, Monmouthshire. Particulars may be obtained of the architects, Messrs. W. G. Habershon and Pite, 38 Bloomsbury Square, London; Park Square, Newport, Monmouth; and Belvedere, Tredegarville, Cardiff.

ROAD-MAKING, ETC.

FINCHLEY.—For making road and drains at Finchley. Plans to be seen at the office of Mr. V. France, Solicitor, 37 New Bridge Street, Blackfriars.

DWELLING HOUSES.

STAFFORD.—For the erection of five houses, at Forebridge, for Mr. John F. Bridgwood, Wolverhampton Road, Stafford. Drawings, &c., with Mr. Henry Ward, architect, Bank Passage, Stafford.

LOCK-UP HOUSE, ETC.

LLANIDLOES.—For the erection of a lock-up house and constable's residence at Llanidloes. Plans and specification to be seen at the office of Mr. J. W. Poundby, County Surveyor, Kerry, Montgomeryshire.

INFANT SCHOOL, ETC.

WARLEY, ESSEX.—For building an infant school and school-mistresses' quarters, at Warley Barracks, Essex. Particulars to be had at the Royal Engineer office, Colchester.

SEWERS.

MAIDSTONE.—For laying in pipe sewers of various sizes, in the district of Perryfields, Maidstone, about 3,500 yards in length, with cesspools, traps, gratings, and other works. Tenders to Messrs. Beale and Hoar, Maidstone, on or before the 10th of June.

WESTMINSTER.—For the execution of general works and repairs to the sewers, gullies, drains, &c., within the Westminster district, under the jurisdiction of the District Board, for the term of one year, commencing from Midsummer-day next. Printed conditions of contract, schedules of prices, and forms of tender, may be obtained at the offices of the Board, Great Smith Street, Westminster, where tenders are to be delivered by, or before, Wednesday, the 11th day of June.

BOGWOOD.

DUBLIN.—The Commissioners of Public Works will receive, up to 12 o'clock, on the 21st June next, tenders for the supply of about 120 tons of Bogwood, to be delivered in such quantities and at such times as may be ordered, up to June 30th, 1863, inclusive, to the various government offices, &c., in the Dublin District.

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favour us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

Received.—W. H. B. P., W. W., A. Constant Reader, G. R. & Co., H. T., J. M., G. H. C., G. and de P., H. J. Jun., M. & Co., H. and J. D. M., J. L., C. J. A., Architect's Assistant, J. T. W., J. W. B., J. R., C. M. S., W. B., Provincial, E. J., J. V., W. H. B., R. A., Ph. D.

* * NOTICE.—The BUILDING NEWS is now published at 166 Fleet Street, where all Communications and Advertisements should be addressed.

THE GREAT THAMES SEWER.

AMONG the essentials to our existence, next to air, there is nothing at once so necessary, so common, and of so little intrinsic price as water — pure water — yet how difficult it is to get, and what an enormous price is paid for the mixture of water and filth which daily finds its way into our houses! In towns it is usually taken from the nearest river or stream, which is at the same time generally considered to be a convenient deposit for the sewage and refuse of the town. In country houses, where the supply may be from wells, they will, in nine cases out of ten, be found sunk within a few feet, and of course at a lower level than, a farm or stable-yard, or, wanting one of these, near to a cesspool, or ditch, into which the sewage is conveyed, to remain during the summer months, a pestiferous nuisance, and in either case to percolate slowly, but surely, into the well whence water is drawn for domestic purposes. The fact is, we seldom drink pure water, and it is equally a fact that there is no reason whatever why we should not be able to do so at all times. There is no difficulty in getting it; we have it supplied to us bountifully, and far beyond our wants; but we do what we can to pollute and render it totally unfit to serve the purposes for which it is provided. Take London alone — why pure water is unknown here, and has been unknown for many many years. We have built a vast city on the banks of a noble river of pure water, that is more than ample to supply every want, but the drainage of thousands of houses has been constantly poured into it, until it becomes absolutely useless, except for the passage of vessels. Then water was taken from a point higher up the river, where it was supposed to be uncontaminated; by and by, the water there was found no longer good, and other points were selected, and water conveyed thence to the metropolis, after being filtered and conveyed through pipes, at an enormous cost, leading to sad deficiency in the supply to certain poor districts. But in every attempt to take water from the Thames for house use, it seems to have been wilfully forgotten that everywhere along its banks, right up to the source, there are towns and villages which, though in less quantities than London, continue daily to pour into the stream, from which a large metropolitan and suburban district is supplied, volumes of drainage from streets, factories, slaughter-houses, and closets. The deposits from water taken from the highest points, whence it is sent to London, and where, by what would be an amusing fiction, were it less injurious to health, it is supposed to be fit for the purpose, are sickening to a considerable degree.

Nor are the water supplies from sources independent of the Thames unobjectionable, it is impossible for any open conduit on the ground-level, which passes by towns and villages, and is at the same time used for the passage of boats, barges, &c., to escape being fouled.

It is, however, with the Thames that we have now to deal; and, with the main drainage works approaching completion, and the commencement of the Thames embankment, as we hope, drawing near, there could be no more opportune time for the present shameful condition of our river to be fully investigated, and for steps to be taken for its preservation in such a state as will make it what it should and might well be, a blessing and source of health to us, instead of what it has so long been, a generator of disease and death.

We are glad to know that a deputation, fully aware of these facts — indeed who is not? — has waited upon the Home Secretary to represent the urgency of the case, and to ask what the public are certainly entitled to. After the vast expenditure incurred in the construction of the main drainage works, it would seem altogether too bad that, having ceased to convey the sewage of London into the Thames, the water at that portion of the river should still be fouled by the drainage and refuse of the towns and villages above the metropolis; therefore the deputation very properly have asked, that government should issue a commission of enquiry into the condition of the Thames and its tributaries, the immediate district of the metropolis being excepted from such enquiry, as being already under special jurisdiction; to enquire what defects exist, and to report what remedies can be applied to such defects, having regard generally to all purposes by which the river and its branches, or lands adjoining to them, may be improved: the deputation asked that the enquiry should be especially directed to the purification of the Thames waters for the use of the metropolis, and of the towns in the Thames district.

The area of the Thames and its tributaries is estimated to contain 6,000 square miles, yet, as we have before pointed out, no systematic, or indeed any provision at all, has as yet been made either for regulating the several branches of the waters in the Thames basin on a common plan, or for deterring the towns and villages on the several parts of it from casting their sewage into the streams, and many towns, say the deputation in their memorial, we say nearly all, do so cast in the whole or part of their sewage. Besides the sanitary view of the question, there is another which may well be considered at the same time; it is, that the unregulated action of floods inflicts damage on

many lands adjoining the river; but in point of fact this also is part of the former question, for it is an ascertained fact, that the health of the population residing in districts subject to floods, is injuriously affected.

But, unfortunately, our hands are not even now quite so clean in the matter as could be wished. It is quite true that we are not going to continue to drain London into the Thames just at the point where it concerns us as inhabitants of the metropolis not to have a vast tank of fermenting sewage right in our centre; but we propose to do, and on a very extensive scale, that which the proposal for the enquiry contemplates preventing others doing. No doubt the deputation was immediately concerned with the state of the Thames at London in consequence of the practice of the towns higher up the river, rather than with the state of the water at any particular town, and London, no doubt, as being most densely populated deserves prior consideration; but what will be the sanitary condition of the district into which the sewage of this vast area is discharged? We have serious misgivings as to the practical result, and believe that the Thames will, sooner or later, be found to be not the proper receptacle for London sewage.

THE SOCIAL SCIENCE CONGRESS.

IT is with some regret that we find the National Association for the Promotion of Social Science has, at the present, its sixth congress, devoted less consideration to sanitary matters than the importance of the subject demands. There is nothing of more consequence than health, since, without it, other possessions are comparatively valueless. The fourth department, whose province is "public health," has limited its attention chiefly to drainage; while the fifth, "Social Economy," treated of little more than dwellings for the working classes. We do not underrate the importance of either subject, but surely there are many other matters to which the Association might have directed attention. There is another point to which we must revert: we know not with whom it is left to decide what papers should be read, but certainly some discretion should be exercised in selection; and we are led to the remark from a knowledge that, in one instance, at least, a paper was read in which it was the author's sole object to obtain notoriety for a so-called invention, which he has long tried to bring prominently before the public by the aid of the press, and vainly, simply because the plan is utterly worthless, and the inventor a person who is not very particular as to the means he employs to force himself into notice.

Mr. RAWLINGS read an interesting paper on "House Drainage and Sewage," a subject with which he is well acquainted, and took occasion to remind his hearers that even in Belgravia, a flat district, the sewers are full of deposit, and that the trapping of drains is a "complete mockery, a delusion, and a snare;" and were it not for the escape of exhalations from the sewers in the streets, he predicted a fearful and raging epidemic. Not only in Belgravia are matters in this state — bad enough for those who stay but a few months in town — but in poor, close, overcrowded districts, many alleys and courts, where people, pale and wan, live through their lives and never see the green fields, there are no sewers in which deposits can accumulate, no drains to be trapped, but simply a cesspool, often uncovered and as often overflowing. This is the direction in which efforts should be made, at the same time that the exhalations from the Belgravian sewers are shut in, which have been sending some unwary passengers over them to a sick-room, perhaps a death-bed.

Are there no other evils to which a department considering public health might devote some attention, forcing on sluggish vestries and other authorities a conviction of the necessity of a change from the olden customs? How far is the dust of our streets, when raised in clouds by a March wind, or such winds as we have had lately, and blown down our throats, conducive to health? Who looks upon street-watering as anything more than a pleasant idea that he would like to see carried out as regularly as the collection of the rates for it? Then there are our cabs and omnibuses. Is no reform needed there, having regard to public health? How many have suffered for years owing to the difficulty of finding a public convenience? In the matter of building, too, it is most injurious to health to live in damp houses; perhaps on a clay soil, with the floor joist touching the earth, and a mock dry area which serves to keep the basement walls damp rather than dry. Then the walls of half the houses erected by speculative builders are plastered with road mud, or "scrapings" used instead of sand, and full of animal and vegetable matter decaying and decayed. These, and many others that need not be particularised, are matters for which there is no legislation. The only remedy is to be found in publicity in every possible direction, and we trust at the next congress to find that the Association have more fully recognised their importance.

BATTERSEA FIELDS. — ROYAL AGRICULTURAL SOCIETY.

TWENTY years ago it would have been difficult to find, in the immediate neighbourhood of any great city in England, a more desolate and unpromising locality than that known as Battersea Fields. Along the river's bank, from Nine Elms to Battersea Bridge, and extending inland to the Wandsworth Road, lay at that time a marshy, uncultivated, and unprofitable tract of land, unsightly to the eye, and by no means conducive to the health, of the visitor. It was, in fact, the resort of the dangerous classes of the metropolis, who considered it as their own especial recreation ground; and devoted it frequently to unconsecrated and most illegitimate practices. The march of improvement has, however, overtaken and metamorphosed Battersea Fields.

The marsh, erstwhile redolent of malaria and miasma, has given place in one quarter to an admirably arranged park, with ornamental water, shrubberies, and glades, in which the old may find enjoyment, and the young healthy recreation; and in another, to the vast and handsome workshops, carriage manufactories, and stores of the London, Chatham, and Dover Railway Company. A handsome suspension bridge, built by Mr. Page, connects the park with the fashionable and aristocratic Belgravia, thus enabling the denizens of the latter, to extend their drives from Middlesex into Surrey; and a railway bridge, of not inelegant proportions, carries the traffic of the above-named railway, to and from the Great Victoria Station at Piccadilly. These changes, it cannot but be acknowledged, are gratifying and satisfactory in the highest degree. They conduce, without doubt, to the moral as well as the physical good of the inhabitants of the metropolis, as they also add to the beauty of the Mammoth city itself.

Before the erection of Page's Suspension Bridge, the neighbourhood of Battersea Fields was as unexplored, by the inhabitants of the opposite bank of the Thames, as is Salisbury Plain by dwellers in the borough. But now, not only do those classes of persons who are fortunate enough to ride in their own carriages, visit the new found land, but pilgrims of a lower grade wend their way by thousands to view and revel in its charms. There are, indeed, few points within a radius of five miles from the Royal Exchange, from which a better panorama — so to speak — of London, can be obtained, than from that part of the Wandsworth Road, known as Battersea Rise, and which extends to Lavender Hill, next Wandsworth. Far down to the extreme right, as one faces the river, is seen the Tower of London, with its venerable, though blood-stained associations; the Monument, commemorative of the Great Fire; the innumerable city churches pointing to heaven, and with St. Paul's, gigantically and grandly presiding over them. Then, carrying the eye still forward, the towers of the Legislative Palace at Westminster, and those of the ancient Abbey, meet it. The first conveys to the mind a startling idea of the wealth of a country, which has expended already over two millions sterling, in providing sitting-rooms for its legislators, and the second, a conviction of the architectural greatness of a bygone age.

Higher up the river, but yet apparently at no great distance from it, are seen — glistening, it may be, in the sun's rays — the domes of the International Exhibition. We will not say that these are glorious proofs of the genius of their designer, but they are extraordinary specimens of the skill and ability of those who erected them. In the background are visible the heights of Hampstead and Highgate, and, on a clear day, and to the extreme left, the tower of the church of Harrow-on-the-Hill may be discerned.

Let us now descend from the elevated ground from which our bird's-eye view of some of the main features of the architecture of London has been taken, and re-enter the park from which the ascent was made. Battersea Park covers above one hundred acres of ground. In these are to be found accommodation for boaters, bathers, cricketers, and riflemen, and these classes of the community have all been in the habit of employing the advantages afforded them with considerable zest, and it may be trusted with advantage. For a time the last-named body will be obliged to dispense with their practice grounds, for, as our readers are probably aware, the annual exhibition of implements and cattle, promoted by the Royal Agricultural Society, will this year take place in Battersea Park.

The spot chosen for this interesting and very important display is, in fact, the large level space of green sward upon which the various rifle corps entitled to the *entrée* have been accustomed to exercise. This piece of ground has been already enclosed by a hoarding of ten feet in height, and inside this are arranged in twenty straight lines, each of about one thousand feet in length, erections for sheltering the implements of all classes and kinds connected with agriculture which it may be expected will be sent there for exhibition. Of course the sheds are of a temporary character, and their roofs will be of canvas, but the amount of material and labour consumed in their construction is

very great. Mr. Manning, of Holborn, was the contractor for the work, as well as for the erection of a series of more substantial wooden buildings — separated by a temporary bridge from those of which we have spoken — and intended for the protection of the "Live Stock," which will form no inconsiderable part of the Exhibition.

In all, something like thirty acres are covered by the stores and stables of the Agricultural Society, and though these are tenantless at present, they have a novel and singular appearance. On the 23rd inst., and during the following days of the show, we can imagine that the interior of the hoarding will present a scene of bustle and excitement such as neither Battersea Fields of the olden, nor Battersea Park of modern times, has before witnessed. It will be our task probably to report upon the achievements of the Exhibitors at the coming display, although the deposits of agricultural implements in the eastern annex of the International Exhibition are of a nature to lead us to suppose that they can scarcely be excelled at the Park.

We cannot conclude our present observations on this subject, without a few commendatory remarks upon the Royal Agricultural Society. There is no doubt whatever that it has been instrumental in furthering, fostering, and promoting the science and the practice of agriculture in Great Britain and Ireland to a very considerable extent. The working arrangements of the Society have been for the most part excellent, and the experience of each year's exhibition has led to improvement, and the strengthening of weak points in the succeeding one. Last year the annual meeting was held at Leeds, and it proved to be most successful.

Whatever Mr. Sidney Smith and his supporters may say about the Prize System generally, we have no doubt that it has worked well in reference to agricultural implements, to say nothing of cattle. The application of steam-power to field culture may be regarded as a great triumph of the prize system, for without the hope of recompense it was scarcely to be expected that manufacturers would have devoted so much time as they have devoted to the making of experiments in that direction. It is probable that the adaptability of steam to the purpose of the cultivation of the soil will be demonstrated more fully at Battersea than at Leeds; but we scarcely see how actual trials of the Steam Ploughs are to be made there, except at the expense of the ornamentation of the Park. "Smashers-up" and "Scarifiers," though very useful in some places, would be rather out of place among the flower-beds and foot-paths of the people's garden. In all probability, therefore, the meeting will comprise an Exhibition of Implements not in motion, but at rest; and the trials for fixed and portable steam engines, fixed and portable finishing machines, hand-dressing machines, barley-hummellers, &c. &c., will be postponed till next year.

The Royal Agricultural Society of England increases in nominal strength yearly, and thus its means of promoting the interests of all engaged, directly or indirectly, in agricultural pursuits is constantly extending. At present the total number of governors and members of the several classes is 4,719, showing an augmentation to the extent of 96 names since 1861.

THE INTERNATIONAL EXHIBITION.

WOOD-CUTTING MACHINERY.

PROBABLY no department of the Exhibition is more practically important to the building profession than the Western Annex, with its rich stores of machines for working in iron and wood. In these days of fireproof factories and warehouses, iron, indeed, has become as essential an element in the operations of the builder, as stone, brick, or wood, and iron planing, punching, and riveting machinery is as interesting to the architect as to the mechanical engineer. Very few years have elapsed since the whole of the manipulations connected with carpentry and joinery were effected by means of hand labour, and what was vulgarly termed "elbow grease." Now, however, all is changed, and there are very few processes in relation to the two branches of building just named, which are not, or which may not be, effected by the aid of the steam-engine and wood-cutting machines.

To the persevering endeavours, and unflinching ingenuity of a few London firms this advancement in the economy of the builder's shop is principally due; and foremost among these may be named that of Worssam and Co., of King's Road, Chelsea. Their establishment is replete with machinery for the accomplishment of almost every operation of useful and ornamental carpentry and joinery. In the Western Annex, they make a large display, but as it was utterly impossible for them to transfer to that place specimens of all the machines which may be seen at work in their factory, we shall not confine our observations to the contents of their stand in the Exhibition, but speak also of those tools of which drawings only are exhibited at Kensington. One of the most massive appliances of Messrs. Worssam and Co. for dealing with wood, in its primary stages of conversion, is their Patent Timber Frame. This is adapted for sawing round or square logs of any description of timber into boards or planks of any required thickness. The bulk of timber, to be operated upon is brought forward under the saw frame by means of what is termed a *silent feed*. The title serves to dis-

tinguish this part of the apparatus from the *ratchet* feed originally used in sawing frames, and to which it is far superior both as regards quietness and exactness of action. It is the subject in itself of a patent. The patent silent feed consists of a wheel corresponding to the old ratchet wheel, but instead of being indented, or serrated on the rim, it has a V groove turned on its periphery, into which is fitted an eccentric V pall, to which motion is communicated, as in the ratchet system. When moved forward, the V edge of the pall presses against the sides of the groove in the wheel, and by the silent force of friction compels it to move forward, and thus propel the timber. Another V pall working upon a fixed pin is added, and this answers to the "dead catch" of the ratchet feed. It is clear, therefore, that by this arrangement the timber may be advanced at any rate of speed which its hardness, or thickness, renders most desirable.

Another patented improvement in this kind of sawing machine consists in attaching the frame to the crank by means of two connecting rods. One of these passes on either side of the swing frame, and thus compactness, and consequent economy in the cost of foundations are effected. The parts of the contrivance requiring great strength, such as the swing frame connecting rods, crosshead, the jaws of the timber clips, &c. &c., are made of wrought-iron, and thus it is capable of carrying one saw to every inch of its width. Thus the 36-inch frame will work with 36 saws, and the same rule holds good with any other sized machine.

The Double Deal and Planking Frames are constructed after the above plan, with some slight modifications, whilst Portable Deal Frames are made, as their name implies, for ready movement to any place where their services may be needed. The Veneer Saw is of course circular in its form, and the largest, we believe, which has been fitted up by Worssam and Co., is 8 ft. in diameter. This consists of a cast-iron disc, keyed upon a wrought-iron shaft of sufficient strength. The disc is turned perfectly true, and to it are screwed a series of wrought-iron plates, intended to receive the saw segments. These latter are attached by copper screws, and they may be readily removed in case of accident or otherwise. The segments are ground to a thin edge by means of a lap made for the purpose, and which usually accompanies each machine. Below is a traversing carriage for feeding forward the timber.

Circular Saw Benches of every size, and fitted with saws of every pitch of tooth, to meet the varying requirements of the workshop, are to be found in the establishment of the firm in question. Perhaps the self-acting saw-bench is the most generally useful of the series, and there are many points of detail about it which deserve a more extended notice than we are at present able to give them. The rate of speed may be made to vary with the character of the material dealt with, but from 12 ft. to 15 ft. per minute is that at which the feed is usually arranged. One of these benches will cut 2,300 superficial feet of deals in an hour. Thus much of the Sawing Machinery of Worssam and Co.; and now let us notice some of that employed in the performance of ulterior operations. The first appliance of this second series which invites attention, is the Roller Planing Machine. It is intended principally for acting upon floor-boards of soft wood, and these it not only planes, but grooves, tongues, edges, and reduces to uniform thickness, at one operation! The plane-irons are fixed in planed cast-iron drawers, and are easy of removal or adjustment. The pressure of the board while passing over the plane-irons is subdivided by means of a number of small rollers, and these are so effective that the boards require no finishing after leaving the machine. Its productive power is great. The Chain Planing Machine is another contrivance of a cheaper kind than that just referred to, and used for similar purposes. It is more serviceable in the case of thick boards than thin ones, and is less productive. Other modifications there are of wood planing machines, all exhibiting considerable ingenuity, but they cannot here be individualised.

A remarkable machine is that for carving, moulding, and shaping irregular surfaces. This is constructed on the copying principle, and a dummy or feeler is made to move over a pattern, and thus govern the movements of the cutting tools. It is peculiarly adapted to the requirements of cabinet-makers and coach-builders. It is also useful in planing and shaping Gothic work, for builders, cutting housings and string-boards for stairs, and similar purposes. What is termed a Nurling Machine, is another ingenious application of mechanical means for accomplishing ornamental effects. It is principally adapted for making waved or zig-zag mouldings in hard wood, for pianofortes, cabinet-work, &c., or for cutting imitative basket-work for ear-rings. A template or copy plate is used in this instance, and the wood to be moulded is fixed upon a cast-iron rack travelling bed, which vibrates at any required speed under the cutters. The result is an exact imitation of the pattern, of whatever kind it may be.

Mortising Machines of various kinds go to make up the complement of Messrs. Worssam's wood-cutting machinery, and these, as may be imagined, are not dissimilar in principle to the slotting machines of the engineer's shop. A very beautiful contrivance, known as Whine's Dovetailing Machine, is manufactured by the firm whose works are under review, and this is the only one yet invented that is adapted for the finest descriptions of cabinet work. It is of almost too complicated a nature to be described without illustration, but it may be stated in its behalf, that it will finish off dovetails in any kind of wood in less time than would be occupied by an ordinary workman in setting them out. It must not be imagined that we have mentioned more than a moiety of the woodcutting machinery of Messrs. Worssam and Co., for their mechanical ability has been devoted, and successfully devoted, to the erection of machines for performing all the processes in relation to wood-work, known to the carpenter, the cabinet-maker, the coach-builder, and the joiner.

Great in the same department of industrial economy are Powis, James, and Co., of the Victoria Works, Blackfriars Road. This firm exhibit in the Western Annex numerous specimens of their admirable machines for metamorphosing rough timber into all the multifarious forms which our high state of civilisation demands. The useful, ornamental, and architectural shapes into which wood has now been brought in the fittings of our dwelling-houses, appear to have been well considered by Messrs. Powis and James, and nothing in this direction seems to be beyond their power. They have constructed machines of peculiar excellence for sawing, planing, mortising, tenoning, rebating, and carving wood. Their horizontal steam engines for putting the woodcutting machines in motion are well adapted to their purpose, being at once simple and inexpensive.

To railway companies, or wagon builders, it may be particularly interesting to know that Messrs. Powis and Co. have devised a Double Tenoning Machine, whereby both sides or ends of two wagons may be completed in one minute from the time the cutters strike the wood. This is a triumph in the art of automatic woodcutting undoubtedly, and one which those interested will know how to appreciate. The Band-Sawing Machines of this firm are remarkable for their adaptability to a great variety of purposes, and are justly prized by those who employ such contrivances. In fact, it is probable that in this department Powis and James are unrivalled. They have patented a plan for preventing the breaking of the saws, which occurrence was attended with much danger to those who were using them, and at the same time regulating the amount of tension necessary for their exact action. This contrivance ensures steadiness and regularity in working, because it acts mechanically and with certainty. As the saw heats and expands, what may be termed the "slack" is taken up, and as it cools its contraction is accommodated.

Other machines and other manufactures in this branch of mechanical art must await another opportunity for a visit to the Western Annex. The subject of woodcutting machines, is one of so much consequence to our readers, that we feel assured they will thank us for directing their attention expressly to it.

THE CHEMISTRY OF BUILDING MATERIALS IN OUR INTERNATIONAL EXHIBITION.

OUR readers must not suppose that it is our intention to devote a page of this journal to technical chemistry, or enter into the details of any delicate analyses performed by our savans. Yet we would call their attention to this most important branch of the science, and ask for a more careful consideration than has hitherto been bestowed upon it in its relation to the requirements of the building profession generally, and the development of that progress which alone is the indication of the presence of that healthful energy our age demands from every profession as its share towards the universal standard, *Excelsior*. In some of the discussions of our various Architectural Societies, we have been surprised at the ignorance tacitly displayed of the first laws of this beautiful science by the credence given to many statements put before the public by ignorant charlatans.

How many aids of a most valuable character might be rendered available to those who should be in a better position than any others to judge of the adequacy of the auxiliary to meet their requirements? Why should the architect be at sea with regard to the quality of a stone or the part of a quarry from which to choose his blocks? or why should an amorphous stone be only discovered to be amorphous when it has deteriorated one of our finest edifices, and become the bugbear of the nation? Why should our builder be at the mercy of his merchants who supply materials *en gros*, without knowing or caring for the circumstances under which they are to be used? Why should the artisan not know the peculiar qualities of the bricks, limes, and cements that pass under his hands, and the best treatment of them, to secure their durability and perfect fitness for the position they are to occupy? We are fully aware that the several branches of the profession have their men of careful and attentive research, but we opine that if many more were to make a careful study of not only this, but of all other branches of science that bear directly or indirectly upon their profession, we should see most satisfactory, not to say startling, results arising therefrom.

Perhaps none have had more to do with the product from which so many brilliant results have been obtained to adorn our Class 2 in the International Exhibition than our readers themselves, and whilst viewing the Magenta or Acetate of Rosaline crowns, must often be reminded of that gorgeous film of surpassing beauty in its rainbow radiance that indicated the presence of tar upon the surface of water in the bucket or the stream. Many are the utilitarian results builders have secured from the use of tar, but a pleasing degree of astonishment, we think, will follow an examination of Mr. Perkin's and Messrs. Maule and Nicholson's cases. The alum in the trophy will recall the progress in the manufacture of cements from gypsum, this having been the first material used to harden the so-called plaster of Paris, the Borax Serpent will show the next step, that being one of the constituents of the Parian; and still further progress has provided sulphate of potash instead of sulphate of alumina (alum) in the cement so well known as Martin's cement, the greater insolubility of the latter salt producing the results that appear in its favour. Aluminium, the highly esteemed substitute for silver, shown by Bell and Co., reminds us of billions of tons that pass through the hands of the builder of the silicate of that base (clay), and its combination in the form of the oxide (alumina) with so many of the substances with which he is called upon to deal. A series of most useful products are exhibited by Bartlett Brothers, of Camden Town, consisting of this alumina and its

applications in combination with silica; and, before going further, we would name three substances which will familiarise our readers with the character of the materials in question, and their extreme hardness and durability. Jasper is silica, ruby is alumina, and garnet (as also corundum) is silicate of alumina. Knowing the extreme hardness of the first of these, every effort has been made to apply it to utilitarian purposes. Chemists succeeded in dissolving it, and cried "Eureka," but experiment soon showed that to be but a partial success. Then others tried by neutralising the solvent (an alkali) to secure the silica in its crystalline form, but all failed from the breaking up of the silica when so precipitated into a powdery mass; then calcium in solution, producing lime and combining with the silica, was tried, still with the same powdery result. It is, however, pleasing and satisfactory to find that silica has at last found a mate, and has been wedded by the before-mentioned firm to alumina, the second of our hard friends, and the offspring is the silicate of alumina, our third. This has been effected by using the same solvent for both substances, and as the one is the reagent or decomposer of the other, an union of the most permanent character takes place in so slow and controllable a manner that we think the two great objects are fully attained,—that of time for manipulation, and a crystalline production, as may be seen from the samples exhibited. The application of this invention to the preservation of stone, and the recombining of waste stone, are the principal objects to which the proprietors have applied their discovery.

But we must not pass the silicates of soda and potash without giving a few hints that may be found exceedingly useful to our readers. Portland and Roman cement having silica, lime, or alumina, or the whole in combination, for their base, are materially aided in strength and duration by the addition of a small quantity of the silicates; and the reason is thus explained—silica has a great affinity for its own substance, and greedily appropriates it when presented in certain forms, and the condition securing the greatest degree of affinity is the soluble one; and this appropriation not only serves to concrete the particles of silica, but also the alumina, lime, or any other substances of which the cement may be composed, for they are dependent for their concretion, and highly so for their durability, upon the affinity they have in themselves for silica, which is presented to them as a silicate of an alkali in the best possible guise. In the decoration of buildings everything remains to be done with the silicates. Stereochromy proper should stand externally; and our celebrated painter, Maclise, having so well succeeded with his last painting in our Westminster Palace, surely is an encouragement to our architects and builders to try, by judicious tests, how far this art may be rendered available; and, whilst on the subject of colours, we may remark that this class contains some of the finest in the whole Exhibition—indeed the artists' colourmen have a most gorgeous display. Varnishes are here also well represented, and we are not surprised to learn from the French themselves that the last coats of all fine work are in varnish of London manufacture. To those who are fond of crystals and crystalline forms, a great treat is given in the crystals of soda, sugar of lead, bichromate of potash, red and yellow prussiates of potash, and others of more delicate form and even yet greater beauty. Fine masses are also displayed of the sulphate of iron and copper. The latter, we would remark, is largely used by our continental friends for the induration of wood, by cutting off the tops of their trees and providing a receptacle for the solution of sulphate of copper, so arranged that as the sap descends from the trees the sulphate may take its place. By this ingenious method the whole mass may be most effectually impregnated and preserved. Space, however, warns us that we must recommend the class to the close attention of those of our readers who visit this Great Exposition, and who, we are sure, will appreciate the great taste and care so evidently displayed by Mr. Charles Quin, the superintendent of the class, and his active and energetic assistants.

INTERNATIONAL EXHIBITION.

NOVELTIES FROM COAL, IN GAS AND LIGHT.

(Concluded from our last.)

THE comparatively obscure man to whom the world is indebted, through his inventions, for the development of coal gas-making, is the late Mr. Samuel Clegg—styled the father of gas-lighting. This engineer first purified gas by lime of sulphuretted hydrogen and carbonic acid. Coal-gas then became suitable for use inside the dwellings of both the rich and the poor. The principal part of the present system of making gas continues as first introduced by the inventor; for instance, the hydraulic mains adapted for isolating the pipes conveying the gas as it is made from the retorts. Mr. Clegg also invented the governor, whereby gas can be forced through the street pipes to the burners in a regulated manner, and one of the most important of his inventions is the gas-metre, modifications of which are now in universal use. Mr. Clegg died about two years since in poverty, leaving his wife in want. Before it is too late, the governments of this and foreign countries should befriend such a man's widow. Several appeals have been made to the public; the effect produced may be gleaned from the following extract from a letter which appears in the last number of the *Journal of Gas Lighting*, headed "A national reproach:"—

"It is lamentable," says the writer, "that genius is so often neglected and discarded during the life of the individual; but this is sometimes atoned for after death, by the appreciation of departed talent. To the late Samuel Clegg is due the honour of establishing gas-lighting; but for him it probably would have been retarded many years, and but for him only a small

quantity of the enormous capital now invested profitably therein would have been employed. It is to be regretted that the laudable example of the *Journal of Gas Lighting* to obtain a competency for the widow of the late S. Clegg, should have met with such slight success; for, on reference to the list of subscriptions, I find that out of upwards of one thousand gas companies, established in the United Kingdom, only thirty-four have given anything, and of the thousands and tens of thousands directly or indirectly employed in gas lighting, only seventy-seven have contributed to the aid of the man who combated all the early difficulties," &c.

We now return to Mr. S. Clegg's last invention, as exhibited by Messrs. Bischoff & Co., Class 31, B No. 6,283. It is an improvement on the wet meter, insuring correct registration independent of a variation of the water level, whether caused by evaporation or wilful abstraction. The principle consists in floating the drum by an air vessel, which permits the revolving drum to rise or fall according to the height of water in the case, and to work free from friction on the bearings.

Class 31, B, also contains glass globular lamps for street pillars and brackets. This description of street lamp has been long in use at Oswestry. The difference between it and the common kind is, the glass of the lamp is blown into the desired shape in one piece, thus dispensing with the ordinary framework at the corners, which intercepts some of the rays of light.

Adjoining, there is a standard gazalier for eighty lights, mediæval in character, for a cathedral, by Johnston Brothers. This has a striking appearance from the profuse number of red and white crystal globules, faceted, which are inlaid into the brightly burnished brass. Then Mr. J. W. Singer's stall, close by, contains numerous Gothic designs of gas fittings, suitable for such buildings as the Houses of Parliament. It is impossible to overlook Messrs. Hart and Son, particularly their crystal drops inlaid, unfaceted, into the brass. This is the manner in which the ancients constructed similar work. The glass is allowed to run in drops when taken out of the glass-house pot, whereby the appearance of rock crystal is produced. There is a sun burner with twenty-six lights exhibited by Mr. Wm. Strode. It is to be regretted that this mode of lighting rooms at night is not more generally adopted. The large amount of carbonic acid produced by the combustion of gas by chandelier and bracket lights is considerable; generally no arrangement is made for removing this injurious gas from rooms. Part of the apparatus of the sun burner carries off all its baneful effects. A few paces away can be seen Young's patent Argand burner. The one on view has eighty holes, and is 3 in. diameter. It is stated to give the light of seventy candles, when burning 20 cubic ft. per hour, at the cost of one penny, at 4s. per 1,000.

The pressure and supply of gas to the Exhibition Building is governed by the regulating valves of Messrs. C. Walker and Sons' make. Their manufactures are to be seen at Class 19. Their stall contains the ordinary rack and pinion gas valves, in order to illustrate more clearly their improved protective screw and index valve.

In the Australian department can be noticed Purchas's patent railway gas tender. This is a travelling gasholder, the size being about 20 ft. long by 7 ft. wide. It will contain sufficient coal gas for supplying twenty-two burners, all being lighted for six consecutive hours; the light given by each burner equalling two ordinary railway lamps. The saving effected is estimated at 30 per cent. between difference of cost of gas and oil. A further advantage is derived through there being less wear and tear of lamps, with little comparative cleaning required.

One of the wonders of the Western Annexe is "Holmes's Magneto-electric Machine and Light Regulator." This extraordinary light was first produced and exhibited by Mr. Holmes in Paris seven years since. The light is created in the following manner:—A revolving wheel has inside its tire sixty coils of copper wire; the current is produced by pieces of soft iron passing between the poles of twenty-two sets of magnets placed round in a circle. All the poles point radially inwards, and pieces of soft iron are fixed in the hollow rim of the revolving wheel, every rotation of which passes between forty-four poles, and as these poles are alternately north and south, the current that is induced in the copper wire surrounding the soft iron changes its direction forty-four times in one revolution; but by means of a commutation, this current is again changed, so that it passes out of the machine always in one direction; therefore, one wire is always negative and the other positive. The light produced is intense—sufficient it is stated, in a revolving lens giving off six rays, to enable any person with average sight to read at ten miles' distance. The great objection hitherto to the introduction of this light for sea purposes is its being always liable to go out, through one of the cardinal points, a carbon wick, continually wearing away. Mr. Holmes has invented a regulator to correct this defect. This remarkable light was two years in use at the South Foreland lighthouse, and is now fitted up by the Trinity Board at Dungeness.

Amongst the gas-making novelties, the patent retort bed in open court, Class 1, No. 387, must not be omitted. It seems to possess several advantages over the ordinary mode: for instance, a setting of six retorts can be altered when working down into a three or two bed, the retorts not required being allowed to cool. The furnace to this patent setting is fed with heated air, &c. People interested in gas companies would find this very deserving of a few minutes' inspection. Mr. J. Reid, Class 31, exhibits a gas saturator. This has been tried before, the object being to correct the tendency of gas to absorb the water in the meter-case by passing the dry gas, previously to its entering the meter, through different channels in a separate vessel nearly filled with water.

GEORGE WILCOTT, C.E.

LABOURERS' COTTAGES, AND THEIR BEARING UPON ARCHITECTURE.*

(Continued from our last.)

NOW the actual amount of accommodation for the labourer is soon settled. He wants a living-room, a kitchen, and a pantry on the ground-floor, and three bed-rooms above, with outhouse for wood, coals, office, &c.; or, to describe the ground-plan, as it is mostly and bestly used—a kitchen, which is also the living-room and the largest room in the house, and a washhouse, which serves as a back kitchen in the summer, and which, if we were speaking of a large house, we should call the scullery. There is the pantry besides, and, if possible, a closet under the stairs. This is the ground-plan required.

The point to be kept in mind in distributing the rooms of a cottage is, that the labourer can only afford one fire at a time; and, therefore, I should not hesitate to put his cooking-range—which it is of the gravest import should be a real kitchen range, with boiler on one side the fire and oven on the other—into the largest and best room—the living-room of the house—the room in which the family sit down to their meals, and around the hearth of which they gather in the winter evening. In common speech this, in the midland counties, is called, *par excellence*, “the house,” and this is the real home of comfort. In order to make this to be so used, the back kitchen, scullery, or washhouse (call it which you will), should be of such small dimensions as to preclude its use as a general cooking or sitting-room; for, wherever it is large enough to be so used, it will invariably be occupied to the desertion of the other room, which will then be preserved in its musty finery, and damp unaired atmosphere, for dress occasions only of fair or festival, or Sunday company.

There is a wretched fashion which pervades all classes of English people—intensifying as it descends in the social scale—of reserving the best and largest room in the house as the one to be least used, and seldomest enjoyed. I know of nothing more forlorn and dismal than to be shown into the finely-furnished, stagnant, unwholesome drawing-room, where you feel in an instant that no foot has trodden since the servant came to open the shutters—not the windows—in the morning. The unpleasant sensation of being shown into a company-room is as bad as being received with company manners; and, common though the practice be, there is something about it altogether dissonant to the English notions of Comfort and Home. My rule would not apply to the great show-houses, where there are really state apartments too large for general occupation; but in all houses below that class, I would say, “use your largest and best room ordinarily for the benefit of your family and your everyday friends,” eschew the dull magnificence of a company-room. Never mind if your furniture gets a little rubbed; chairs were made to be sat on, carpets to be walked on, not to be looked at. But you are afraid of the children breaking your glass-shades, and sweeping off the table your nervous doyleys? Then do away with them altogether; and if the ornaments, placed under the one or on the other, go away along with them, there is no great loss. A single glazed cabinet may hold all your things really precious, and if the rest of the decoration of the room be such as will bear ordinary stowage and knockage, it will be introducing a far more manly and wholesome style of ornament than the wretched ormolu and papier maché frippery which now too commonly crowds the tables and mantelpieces of our drawing-rooms—especially of new-married people. Or, if the result should be that the children of the rising generation be brought into better order, and made to respect the amenities and decencies of drawing-room life, it will be no private or public disadvantage, and perhaps will be useful in modifying the somewhat rampant characteristics of the young England of the present day.

I may seem to be travelling away from my cottage subject; but if I can get hold of principles of general application to all classes, it will have greater weight on any particular case, and I shall not be laying down a law for the cottage which I would not carry out in the mansion.

My object, then, is not to allow of a company-room in my model labourer's home; for it necessarily entails a sloppy, untidy, comfortless, everyday existence in the washhouse or scullery; but if you make this latter room so small that it cannot accommodate the family at their meals, if you put the kitchen-range in the best room, have only a small hearth in the scullery, with boiler and sink, then you make this back-room what it should be, the place for washing, slopping, and “doing,” as they say, “their jobs in,” and you force the family to live ordinarily in the largest and wholesomest room, which necessitates certain more comely observances of civilised life, and helps to elevate the whole household in their social relations. The really tidy, good housewife, the good mother who takes pride in the cleanliness of her pets as well as of her pots, and likes to see her family in substantial comfort around her, will prefer this arrangement, though it implies a little more method, and entails a little more labour, to keep all things in their places in a room constantly occupied.

It is the slattern who, in her room or her dress, for the sake of Sunday's finery, is content to go all the week in dirt and discomfort. In a plan on the wall, it is proposed to carry out the idea by making the living-room, in front, 14 ft. by 12 ft., with the scullery 12 ft. by 8 ft. (by the projection of copper, sink, &c., reducing it almost to a square of 8 ft.), and the pantry, which is full large, 7 ft. by 6 ft.; but the coal or wood house might also, possibly with advantage, be combined, and so the expense of these as outhouses be saved.

The reason of the scullery and pantry being drawn even as large as they

are here is, that with a less ground area you cannot obtain the three bedrooms above, which are now rightly considered indispensable for a good cottage. That the parents, the boys, and the girls should each have a separate bedroom, is now deemed imperative in all well-ordered cottages; and I would not say a word against such a requirement; but I do think that the evils of crowded bedrooms have, as affects the morals of the poor, been exaggerated by those who look from what the Quarterly Reviewer calls “a dressing-room point of view.” It is rather on the score of health than of morals, that I would ask for the area of three bedrooms; and I believe that where the parents' chamber is between that of the boys and girls, a curtain may be often as serviceable as a thin wall partition. Certain it is, that both thoughts and habits of decency can accommodate themselves much more to ill-arranged sleeping rooms, than those who are accustomed to the absolute privacy of bedrooms are wont to admit; and the pure and chaste morals of the lower Irish in their huddling bedroom arrangements are a remarkable testimony to this fact. But admitting the necessity of three bedrooms, the great crux of cottage building has been to get them of sufficient size over the ground area required for the living-room, scullery, and pantry. In trying to accommodate the one story to the other, either the bedrooms have been cramped to a most inconvenient and unhealthy size, or the scullery has been enlarged, so as to make it become the general living-room, at a waste of space and money.

A plan before you, I think, takes a middle course, making the three bedrooms respectively 12 ft. by 9 ft.; 12 ft. by 9 ft. 3 in. in the widest part; and 11 ft. 2 in. by 8 ft. 2 in., with a corner taken off for the stairs. The two larger have fire-places, and there is a separate entrance to each. I will then set down the accommodation required for the married agricultural labourer as consisting, on the ground-floor, of: 1. Dining-room or kitchen in one; with range containing oven and boiler, pot-hooks, cupboard, light convenient for cooking, that is, on the side not facing the fire-place. Superficial area not less than 168 ft. 2. Scullery with sink, copper, small hearth, fire-place with outer door communicating with back yard, and another door communicating with passage, or, better, with living-room. Superficial area 96 ft. 3. Pantry, with shelves and room for beer cask, window opening into the outer air, and in communication with passage or scullery. The three bedrooms, respectively, two about 108 ft. and one 90 ft. In round numbers, an area of about 300 ft. on each floor. The height of the lower rooms 8 ft.; of the bedrooms the same, or 5 or 6 ft. on the walls, with the roof taken in.

The best arrangement of this number of rooms is that which allows of an outer porch, with inner lobby or passage, giving independent access to stairs, kitchen, pantry and scullery, with landing upstairs admitting separate entrance to each of the three bedrooms.

It may be doubted whether this arrangement of separate entrance, deemed so indispensable in a middle-class house, should be regarded as necessary in a cottage. It is certain that the labourers do not themselves care so much about it, and seldom complain of the door opening direct upon the living-room—of the stairs going out of the living-room or the scullery—or of the bedrooms opening one into another; but when we are seeking a model plan, it is as well to get as perfect an arrangement as we can, and one which will help to foster habits of order, and akin to what has, from its convenience, been sanctioned by classes higher in the social scale.

What the poor do complain of—and too often with reason—is in the new cottages which have been provided for them, is the thinness of the walls, the cold draughts, and the smoky chimneys. I will go, therefore, into some details on these heads, saying a few words first upon the site.

I need not speak of the soil, because we must take that as we find it. Of course, we should prefer dry, gravelly ground, where we can procure it, as much for the cottage as the hall. We should regard, also, how the ground lies for drainage, and for a supply of water. But one rule of aspect, applying to the cottage, is directly the opposite to that of the mansion. In the great house we want the south for flower-garden and private use, and so contrive the public entrance anywhere but there; but in a cottage, which can afford but one front, we should always, if possible, get this to the south—the door opening to the south, and the window of the living-room having the same aspect, looking upon the little garden of herbs and flowers, with the wicket upon the road, about six or eight yards off. The increased cheerfulness and comfort of a cottage so placed can hardly be overrated. There is no single drawback, that I know of, to this arrangement. It throws the sunny side of life into the living-room, gives the south wall for the vine or the apricot, and the flowers; and throws the hot washing work, and the little larder, to the northern or cool aspect.

The foundations of the walls should be deep enough to admit of the joists of the boarded floor—which I should like that of the living-room to be—being laid with eight inches, at least, hollow beneath, and with air-bricks in the basement course. Above all, immediately below the floor-level, the whole of the walls should have a layer of slate, laid in cement, or of asphalt, so as to prevent the damp rising. This, which indeed should never be omitted in any building, is most imperative in a cottage, where the presence of damp is too often the evil spirit that paralyses the strength and support of the whole family; and yet, though the cost is scarcely appreciable, there is no preventive oftener neglected than this.

Equally fatal to the comfort, health, and whole economy of the cottage, are the thin walls always used by speculative builders, and too often by those, also, whose aim is the increased happiness of their poorer neighbours. No common 9-inch wall, in an exposed situation, will keep out damp and cold; but hollow bricks of that thickness, or the same amount of bricks used hollow, and making eleven inches of wall, will suffice. I have drawings here, showing how bricks may be so used; but the difficulty of

* Paper read by the Rev. Canon JAMES, at the Architectural Museum, South Kensington.

getting common bricklayers so to use them is, I know, excessive; and, from their inaptness to this kind of construction, a most disproportionate expense is added to the estimate. If we could once get our bricklayers out of the groove of the common solid 9-inch and 14-inch work, the extra material or labour required for 9-inch, 11-inch, or 12-inch hollow walling would achieve a most important advantage, at a comparatively small cost. Contrary to what is usually recommended, I should plaster the living-room and the bedrooms within; and if I could only get 9-inch solid walling, I should paint it on the outside, as an effective repeller of the damp.

Where stone can be procured as cheap as brick, it should be used, as necessitating a substantial thickness of wall; but I am convinced that, where it is the custom of the country, there is nothing so effective for cottages as mud walls. In the midland counties, I am sorry to say, they are disappearing; but there are many parts in the south and west where the old method is kept up, with some improvements introduced. But the art of building these walls is so local, and so dependent on the material at hand, that, though I could wish, for the sake of their warmth, to see them generally extended, I can hardly hope it. But some method of "post and pan," or of concrete, using the common soil for the main substance of the wall (as, I believe, is common in Eastern countries), might surely, if attention were given to the matter, be made available, as the cheapest walling for any locality.

(To be concluded in our next.)

ARCHITECTURAL ASSOCIATION.—MR. R. P. SPIERS ON ARCHITECTURE IN NORMANDY.

(Concluded from our last.)

CAEN is the most interesting town for the searchers after the finest specimens of Norman architecture, possessing as it does the two largest churches founded by William the Conqueror and Queen Matilda. The first of these, l'Abbaye aux Hommes, known by the name of St. Etroum (St. Stephen), has the form of a Latin cross. The side aisles are carried round the choir, where there are chapels annexed. The nave and transept were consecrated in 1077; the choir is later, and has circular arches crossing one another, thus forming pointed arches. The whole of the nave is rib-vaulted with circular arches. The towers, which are of the eleventh century, had spires added to them in the thirteenth or fourteenth century, at which period there was a further addition made to the building of four towers and spires at the east end. The central tower is of the fourteenth century, and suffered much from the cannon balls of the English during a siege. L'Abbaye aux Dames, Holy Trinity, though inferior in size and proportions to the last-named building, yet has more genuine Norman parts about it, and has been also added to, than St. Stephen's. The choir, which is very fine, is circular, decorated with a double row of circular-headed arched springs, the arches being supported by detached columns. The central tower is of the thirteenth century, with a fifteenth century balustrade. The western towers, which are undergoing restoration, have a renaissance coping of the seventeenth century, which M. Ruppreck Robert, the architect, proposes to remove and replace with coping balustrade and spires similar to those of the Abbaye aux Hommes. St. Pierre, the church of next importance at Caen, is of various epochs. It possesses the most elegant spire in France, of the fourteenth century (dating from 1308, and being 200 feet in height), and the richest choir of the sixteenth century. The nave and side aisles are of the fifteenth century, and there is a beautiful western façade of the fourteenth century. The oldest church in Caen is that of St. Nicholas, the most ancient part of which is extremely simple, having no ornament or decoration whatever. The chancel is covered with a conical roof in stone, and which is of later date than the chancel itself. The tower, which is of the fifteenth century, is an elegant structure. This church is no longer used for religious services. The church of St. Etienne Leveux, near l'Abbaye aux Hommes, is nearly in ruins, but is frequently visited by English architects, the structure having some beautiful carving of the fifteenth century. The church of St. Leneveu has a fine tower of the thirteenth century, resembling that of St. Pierre. The two chancels, one of the fifteenth and the other of the sixteenth century, are interesting objects, and, standing boldly out in the principal street of Caen, form a pleasing picture, often sketched by artist-tourists. St. Jean has a tower which inclines slightly, like the tower at Pisa; the church has been built on to it whilst in its leaning position, and the effect in the interior is very curious. There are three or four other churches in this neighbourhood well worthy of a visit, especially that of Vancelles, which has a fine though small Norman tower, and a lofty fourteenth century choir. The Manoir des Gendarmes is a structure which is perhaps more frequently visited than any other building at Caen. It has two towers, connected by a long wall with battlements, and is of the sixteenth century. There is a series of medallions with heads sculptured on the battlements, and are supposed to be portraits of persons existing at the time of their erection. The Hotel de Ville was built in 1537. Caen is a very clean town, though it has but few flagstone pavements, and it can boast of meadows and promenades similar to those at Christ Church, Oxford. It contains a large château, with fortifications and a dry moat. The lecturer proceeded to state that from Caen he made another excursion, visiting some of the villages he had missed in his tour from Bayeux, and others which lay more to the north-east. The choir of St. Contest, which is vaulted, is Norman, but some of the arches being pointed indicate the transition epoch. The tower is of the twelfth century, and the nave of the thirteenth. Lasson has a very pretty example of a

private château of the sixteenth century, the wall being decorated with delicate pilasters. The mouldings are rich and elegant; there is a strong corbelling, carrying a frieze ornamented with cartouches and medallions, and above it a parapet. The château possesses the circular-headed window and large chimneys which denote the time of Francis I., sixteenth century. In a billiard-room on the first floor is an exceedingly rich wood-panelled ceiling, coloured and gilded, resembling those of the ducal palace of Venice, and supposed to be the work of an Italian architect. The church is nearly all modern. Thaon has two churches—one new, and having nothing remarkable about it; and the other, which is falling to ruins, has been a very fine and beautiful structure. The latter is composed of a central nave, lofty choir, and tower. The tower has two stories, and is pierced on each face with a circular arch and two openings. There were originally side aisles, which have been suppressed, and the nave arches are blocked up. The walls are decorated with a series of blank arcades, and a flat Norman ornament. The church of Fontaine Henry has a very beautiful Norman choir, and the nave is modern. The château, which attracts most of the visitors, is an interesting structure, of many epochs; its decorations comprise the most beautiful and delicate work. The chapel belongs to the close of the thirteenth century. The walls are decorated in the interior with a series of arcades, carried by small columns; and between each is a seat, hollowed out in the stone. In the sixteenth century the nave was vaulted with low segmental arches, carried by columns, descending into the nave. There are three elegant windows pierced in the chancel. Colombiers has a well-preserved tower of the twelfth century, pierced with circular-headed windows, which are very elongated, like those of the thirteenth century. The church of Ver has two very distinct parts—the choir and tower, of the twelfth century, and the nave of the thirteenth. The old Norman door, on the west, still remains. Above the southern door is a bas relief of "St. Merthin Cutting his Cloak." A similar bas relief occurs in two or three other churches, and they are of the sixteenth century. Cousseulles is famed for its oysters, which are of a very large size, three or four being sufficient for a meal; and yet they only cost, at that place, from three halfpence to two-pence a dozen. Bernières is one of the most important churches of the arrondissement of Caen, having an elegant and lofty tower, of the thirteenth century, and in front of which is a very beautiful porch. The tower is 200 feet high, and is the loftiest tower attached to any rural church in Normandy. The third, fourth, fifth, and sixth arches of the nave are Norman; the first and second seem to have had their columns replaced, or else they were added at the end of the twelfth century. The whole is vaulted, the first and third divisions pointed, and the others circular. The choir is of the fourteenth century. Langmum possesses a very pretty cruciform church and tower. Here, again, there is a difference in the style of the divisions of the nave; the first three arches are circular-headed Norman, the five following pointed, and they are carried by huge cylindrical columns. The lower part of the tower is of the thirteenth century, and the upper part of the fourteenth. At Lion is a picturesque château, of the sixteenth century. Hermanville has a pretty tower of the twelfth century—nearly the only one which has neither spire nor visible roof. The nave of the church dates probably from the first half of the eleventh century. Onisticheron has a central tower, and very lofty choir, with an imposing façade of four stories. From Caen, on my return home (continued the lecturer), I visited Lisieux and Evreux. The first of those towns has a very fine church, that of St. Pierre. It has two towers on the western façade; and though built about the same time, their construction is very different—one being Gothic, and the other Romanesque, but both being on a Gothic base. The nave, transept, and side aisles are of the same date as the façade—the latter end of the thirteenth century. The choir, which is a very fine one, and central tower are of the fourteenth century. There are several finely-carved wooden houses in the town, of the fifteenth and sixteenth centuries. The Cathedral of Evreux dates from different periods—the most ancient portion being the lower part of the nave, which is of the eleventh century. The transepts and choir are of the fifteenth century, and the towers of the façade of the sixteenth or seventeenth. The eastern end of the church is very fine, both in the interior and exterior. There is much beautiful carved woodwork in the screen which separates the chancel and its side aisles and chapels from the church. The Town des Anglais is an isolated town of the fifteenth century; but it has a church, that of St. Taurin, which is interesting, owing to the different dates of its construction. Some of the arches of the nave are circular, and of the eleventh century, while others are pointed, and of the fourteenth century. There are some remains of Norman arches in the south transept. The Bishop's Palace is an interesting structure, of the fifteenth century; but (said the lecturer, in conclusion), as winter was setting in, he was prevented from visiting it, as well as other parts of the town, and set off for Paris.

FOREIGN ARCHITECTURAL DRAWINGS IN THE INTER- NATIONAL EXHIBITION.

THE International Exhibition of 1851 was almost exclusively an Industrial display. Two out of the three higher branches of art were unrepresented there. It afforded us no opportunity to compare the powers of English architects or of English painters with those of foreign artists; and our sculptors were favoured more, perhaps, because their works were peculiarly suited to the embellishment of the building, than from any desire of testing their ability. We can hardly think, from the specimen which the Commissioners of 1862 have given us in the building itself, that they have any particular love for, or taste in, architectural matters; but as wall-space had to be

provided for pictures, the claims of architecture could not be repudiated. We have consequently abundant evidence in the building that the "huge shed" is not a representative type of modern English architecture, and that Captain Fowke is not in the first rank of British architects. Every cloud, it is said, has a silver lining. If the South-Kensington building is a mere brick-stack, a "bleared visage," which "rather threateneth than doth promise aught," we have only to enter the architectural galleries in order to forget it. The display on the English side is really a noble one. The same independent study which characterises our paintings, is seen also in our architectural designs. Extreme liberty of thought, and almost contemptuous disregard of the teaching of any particular school, gives a peculiar interest to them. We see here no army of architects working according to a professor's instructions, or looking at precedent through an uniformly tinted glass; we recognise no common drill to which all have at some time or other submitted; but the labours of men who read the great lessons of art, and interpret them each after his own fashion, and who march without keeping step with each other, but still unfettered — to their object. Hence what we lose in mass we gain in variety. There is less evidence of facility, but more of force; less harmony, but more picturesqueness. If we occasionally show works which no foreign architect with his course of education could produce, we, at times, scale heights which they cannot climb, and pass them at a bound when they are putting forth their full strength. At Hamburg we surprised, and at Lisle we astonished them. Wherever we have met them we have proved ourselves worthy rivals. And yet, there is no blinking the fact that, as a body, we are not half-educated in comparison with foreign architects. In proof of this we would ask simply upon how many of us has the study of figure-drawing been enforced? There are few of us who can sufficiently delineate that portion of the ornament in our buildings wherein figures are introduced. We fall back too often upon professional architectural sculptors, and leave them to elaborate our general conceptions. Our designs occasionally, by their deficiency in this respect, and their eccentricity in others, provoke a smile from the more accomplished foreigners. Their designs never affect us in that way. They may be tame and weak, but they are never simply contemptible. They have always some trace of the skilful hand and of the cultivated mind. If foreign architects follow too frequently, to suit our insular notions, a beaten track, the groove they run in has been dexterously cut, and they do not start upon their course before they have manifested a certain degree of capacity for it. The strict examination which all of them undergo, and their training for it, shapes no doubt their after development. Our exemption from it produces that unbridled diversity seen in all our public and private buildings.

The difference of our respective governments, and the different objects with which public buildings are erected, here and abroad, tend still further to alter the character of our architecture. No better evidence can be given of the influence, for good or for ill, which a government or a monarch has upon art, than a reference to the modern buildings of Munich. They have been chiefly erected by Von Klenze, one of the ablest of living architects. When he worked under the inspiration of the ex-king, he produced something worse than feeble copies of great originals. His version of the Loggia di Lanzi and of the Pitti Palace at Florence, is about on a par with the comical reproduction of the Choragic Monument of Lysicrates on the Regent Street Chapel, or of the employment of the Jupiter Stator columns on a London shop front. The "Art Monarch" threw the same dark shadow upon painting as he did upon architecture. Artists could not show their heights, when they were commanded to stoop to a monarch's caprices. In the minor buildings of Munich, and in some public ones, for which he was not referred to Italian examples, but in which his pure taste had free scope, Von Klenze showed the great ability which has made his name known throughout Europe.

The sameness of modern French architecture is likewise the result of political circumstances. Conceived on a grand scale, the works have been forced forward upon a common plan, the main object being to afford good space for any military operations which may hereafter be deemed necessary, to sweep away all narrow and troublesome quarters, and at the same time to furnish employment for men whom it would be dangerous to leave unemployed. The regularity of the streets and houses, and the hurry with which they have been erected, have, however, given little scope to the talents of French architects. They have refined the old Franco-Italian style; and in isolated spots in Paris, it bursts forth with charming freshness and vigour. This is more especially seen in the works of Visconti, of Duban, of Amadron, and in what is called the artists' quarter. In the long lines of the Rue Rivoli and the Boulevard de Sebastopol, the fire of French architecture seems to have "in pallid moonshine died," or only to flicker here and there in the sculpture of ornament and in the transposition of balconies. The French restorations of old Gothic buildings betray only too plainly their insensibility to their beauties. This is not the fault of their architects. Viollet le Duc's labours alone are sufficient to redeem them from that imputation. It results rather from the political necessity of doing the work, and of the vanity for coating the whole of Paris with a veneer of magnificence.

French architects seem generally to devote themselves to infusing a greater degree of refinement than it has heretofore possessed to Roman art, or rather to that slip from it which was transplanted and made such rank growth in France. However much it may by individual talent be occasionally disguised, it is the study of Greek monuments which has pruned the straggling coarse ornament which made up the "magnificence" of Louis XIV. One end of the line which strings modern French architecture together is seen in the Pompeian House of Prince Napoleon, the other in

the designs of Amadron. Both examples are very clever; but there is a vast amount of very different and indifferent stuff between them.

The Germans seem to have adhered more rigidly to the Greek models in their public buildings. Schinkel, in his many designs for public buildings, and notably so in that of the Museum at Berlin, has handled it with a power surpassed by no modern architect, and equalled only by the design of the Walhalla near, and the Glyptoteek at Munich, and, perhaps, by Elmes, in St. George's Hall, Liverpool. In their ordinary street architecture they betray a close analogy to that of France; and the drawings of the students of the Academy sent from the Berlin Academy to Brompton might really be mistaken for those yearly seen at the "Beaux Arts" in Paris. Their Gothic architecture is rather too prickly and metallic to suit our tastes. The new growth does not seem to have yet ripened there, although we must candidly admit that there are drawings in this style in the Austrian gallery, which we never anticipated seeing. The Votive Church, Vienna, by Henrich Ferstel, is portrayed in a series of drawings which are unsurpassed in the whole exhibition. They are not only on a large scale, but every touch indicates the masterly power which formed it.

The principal contributions from Prussia have been sent by the architectural publishers, Ernst and Korn. They are valuable, as giving us a better insight into contemporary Prussian works than a few views occupying the same space would do.

Hamburg is well represented by MM. Meuron and Haller, whose "buildings in the Zoological Gardens at Hamburg" show remarkable artistic skill and fertility of design. Rome sends us only some plans of mills for crushing olives; and Italy — as distinguished from Rome — a few Pompeian views. Spain gives us no indication of her modern architecture, and but a few specimens of what once made her famous in art.

Before noticing more in detail the foreign architectural works, we must remark that they are depicted less strikingly than those in the English department. Whilst ours are drawn in perspective, and highly coloured, theirs are more frequently simple geometrical drawings, with plans and details. Moreover, they seem to us to have been also designed geometrically, and perspective views, more often than not, show them to disadvantage. But, on the other hand, the plans and details which nearly always accompany them, give them a value which the English drawings do not possess. It enables them to be read at a glance, and to be thoroughly comprehended by architects.

Knowing what the French can do, and have so recently done in Paris, we certainly expected to see them in greater force, but we regret to find that most of their great architects are altogether unrepresented in the Exhibition. Only about forty or fifty subjects are included in the collection, and of these more than one half are proof engravings, lately published. Thus we have fourteen or fifteen sheets from the "Monuments Historiques," issued by Gide and Baudry, and about a dozen from Cesar Daly's "Architecture of the nineteenth century." These latter are further insufficient, inasmuch as they withhold the names of the architects whose designs they display.

Viollet-le-Duc treats us to some fine views of his restorations of the ramparts of Avignon, crowned with machicolations and battlements, and guarded by watch-towers. Its eight gates, and the bridge of St. Benzet, with its chapel in the centre, are all restored in the most conscientious manner, after a scrupulous examination of the ruins. Laisné sends a project for the restoration of the picturesque cathedral of St. Nazaire, at Beziers, famous for the horrible slaughter of the unfortunate Albigenses in the early part of the thirteenth century. The town hall at Compiègne, with its fine beffroi, angle turrets, and high pitched roof, is well represented by Verdier. Millet sends drawings of three churches, the best of which is that of Cogniat, Department of the Allier. It is very simple, consisting of a nave with three apses at the eastern end and a tower at the western end. Ruprich-Robert, whose designs are amongst the finest embellishments of Paris, has been content to contribute only a study of one of the old French abbays. The drawing is hung too high for proper examination. An engraving by Sauvageot (21), after Viollet-le-Duc, of the city of Carcassonne, gives a rare example of a restored city being as picturesque as it is in ruins. Normand sends seven fine drawings of Prince Napoleon's house, but by some characteristic mismanagement they are separated and hung in two different situations.

The Prussian architecture is best represented by architectural publications, although most conspicuously by a huge model of the Exchange at Berlin, in the eastern end of the nave. The "Brick Architecture of Prussia" (501-2) is a folio volume with fine examples from Osterburg, Jerichow, Krewese, Stendal, and Tangermünde. Adler's design for the new Town Hall, Berlin, is a dismal looking brick building, but it repays a more careful examination than it, at the first glance, invites. Carl Bötticher exhibits his love for Greek art in two works, "The Teutonic System of Ancient Greece," and "Designs for Architectural Ornaments." C. von Diebitch has a good view of a cathedral, and a creditable design for the town-hall at Berlin, but his views of the Alhambra, and especially that of the Court of the Lions, are not up to the mark. Ernst and Korn contribute a series of numbers of their Architectural Magazine, "Architektonisches Skizzen-buch," which will give our readers just such an idea of ordinary Prussian architecture as a volume or two of the "Building News" would afford a foreigner of our recent designs and erections. E. F. Giese, of Saxony, exhibits, in a series of seven photographs from the original drawings (521), the prize design for the new Opera House, Vienna. It is, in geometrical elevation, a pyramidal composition, the central portion being four stories and the extremities but one story high. It is in the renaissance style, with columns to each story, and sometimes smaller ones in the window-jambes. The "Drawings of a Princely Residence," by Paul Habelt, is of a most elaborate character, and would

cost, we fancy, more than princes have to spare now-a-days. We are indebted to Hitzig for the large model in the nave, to which we have already alluded, which deserves notice more for the good arrangement of the plan, and for the beautiful modelling of the ornament which accompanies it, than as a design for an important public building. Other designs, by the same architect, show the same Greek tendency, but we do not see in any the same lofty aim which reposes upon every work of his countryman Schinkel.

Knoblauch has three designs in the Exhibition, but there is one only, the new synagogue, in the Oranienburger Strasse, Berlin, which will arrest the eye of a visitor. It is Eastern in style, with a large central Moorish dome, and smaller ones at the angles. It is covered with elaborate and well designed ornament. A design for a small museum introduces us to Luce, a devoted admirer, seemingly, of the severer Greek style, whilst the drawings of Meuron and Haller, of Hamburg, possess that tasteful freedom in the employment of Italian art, which is only elsewhere seen in the best of modern French architecture. The drawings are altogether excessively clever, but the entrance is preeminently so. There are altogether five 'sheets of them (557). A small book by Meyer, "Handbook of Gardening," is devoted to the ornamental arrangement of gardens. In Von Quart's "Historical Monuments of Architecture in Prussia," there is a good view of the Schloss Heilsberg, and in Runge's "Brick Architecture of Italy," some accurate and detailed representations of the well-known Town Hall at Piacenza, the Palace on the Lungarno, at Pisa, St. Giovanni e Paolo at Venice, the Hospital at Milan, and the less known but no less beautiful St. Chiara at Siena. Other fine publications of Ernst and Korn contain the best of Schinkel's designs—all worth attentive study.—Salzenberg's monuments of early Christian architecture in Constantinople, Strack's architectural details, mostly taken from one house in the Leipziger Strasse, and the splendidly worked out Greek design by Stueler, for the new museum at Berlin.

In 579-86, we have another creditable Gothic design from Prussia, by Schmidt and Strauch. It is beautifully drawn, and we are mistaken if Viollet-le-Due has not greatly influenced the designers. It is sent here by the Royal Academy of Architecture, Berlin, who are large contributors to the Exhibition. The drawings of a city gate, by Aug. Tiede, are likewise very successful studies. Amongst the German oil pictures a painting by Von Klenze deserves notice for its architectural merit. "Athens in the time of Hadrian" is therein represented by one whose studies have enabled him, better, perhaps, than any of his contemporaries, to conceive it. It is composed of porticoes and caryatides, sculpture relieved by colour and marble columns. In the background the Acropolis is seen crowned by the walls and columns of "Pallas' fane." We would also direct attention to some wonderfully manipulated interiors by a Danish painter, H. Hansen, 1513, 4, 5, 6. They are rooms in the palaces of Fredericksborg and Rosenborg. As perspective studies they are amongst the most wonderful pictures we have ever seen.

STAINED GLASS IN THE INTERNATIONAL EXHIBITION.

WITH AN ILLUSTRATION.

STAINED Glass Windows for the enrichment of churches, for monumental purposes, and for the decoration of dwellings, are of two descriptions, Pictorial and Gothic, the former bearing the character of transparent pictures, to be judged of as works of art generally; the latter, of decorations accessory and subordinate to the edifices they adorn. Hence stained glass windows possess a relative, as well as an intrinsic, value.

Pictorial glass is preferred by some as enabling the artist to give a more life-like delineation of the human figure. This advantage, however, is obtained by the sacrifice of the special qualities of the glass itself, assimilating it, in fact, to painted porcelain. Gothic or decorative glass, on the other hand, exhibits in the highest degree the glowing and jewel-like effect of coloured glass, admitting at the same time the greatest beauty in its abstract lines, and a perfect harmony with architecture. Both styles, however, require invention, combined with skilful drawing and manipulation. To illustrate these remarks, the Virgin and Child by an Italian artist, and numbered 2021 may be taken as the extreme of pictorial glass, and Powell's window, designed by Jones, Class 34 A, as the extreme of the Gothic school. The time is recent when it was thought impossible to reproduce the glowing tints of old glass, more especially of the thirteenth century; but tints more varied, and fully equal in richness, now come from the studios of our leading glass stainers; for, owing to the increased demand for memorial windows, and for stained glass generally, many superior men have diligently studied the art, and glass makers also have been stimulated to prepare materials which leave nothing to be desired.

The result has been a simultaneous advance in the quality of stained windows and a decrease in their price, so that the richest figure work now averages but 30s. per square foot, instead of 50s. or 60s., whilst the ornamental designs can be procured for 25s. per foot down to 5s. for the simple but beautiful ornamental quarries.

The Commissioners have given great dissatisfaction in their defective provision for this branch of art, evincing in fact, their ignorance of its requirements. In the galleries a borrowed and diffused light only is obtained; whilst in the transept, worse still, the sun shines upon the front of the stained windows, instead of behind them, thus rendering the colours almost invisible, revealing only the lead work. Full allowance must therefore be made by visitors for these drawbacks.

The stained windows exhibited by Heaton, Butler, and Bayne, in the west transept or Austrian department, are examples of the thirteenth and

fourteenth century styles, and in the galleries, Class 34, of the fifteenth and sixteenth centuries.

In these they have endeavoured to combine the architectural character with the most refined and original designs, and the richest jewel-like effect of colour.

Of the windows exhibited in the gallery, Class 34, the most striking is, perhaps, that of "the Adoration," in which the background is composed of numerous tints of colour varying from light blue green, to purple; the expressive head of the Virgin is most carefully and delicately treated, but the unfortunate position of the window is fatal to its beauties, which require a strong clear light to bring them out in their integrity.

The heraldic window is treated in a most simple but artistic manner, and the colours being on a white quarry ground, will commend it to the taste of connoisseurs.

The window above the "Adoration" is intended for Skulthorpe Church, and illustrates the history of Ruth; here, also, coloured ornamentation on white ground is used to give relief to the figures. The other window, for Langton Church, contains the principal events in the life of our Lord, the treatment being of the ordinary character.

There are several superior windows in the west transept, Austrian Department. The most unique is the "Procession of the Burial of our Lord," the original cartoon of which is exhibited in Conduit Street Architectural Exhibition, and has met with general admiration.

We present our readers with an engraving of a Stained Glass Window, by Messrs. Heaton, Butler, and Bayne, of Cardington Street, intended for the Baptistery of St. Alban's Abbey. Considerable repairs and restorations have been recently effected under the superintendence of Mr. Gilbert Scott; and the elaborate workmanship and brilliancy of the colouring of the present work of Mr. Heaton and his co-partners, will make it a gorgeous addition to the varied beauties of the baptistery.

It is exhibited in the West Transept of the International Exhibition, immediately over the entrance to the Annex for machinery in motion, and though placed in an unfavourable light, its colouring, workmanship, and some novelties of construction can scarcely fail to attract the attention of visitors, especially of amateurs of the art.

The greater part of the Abbey, and especially the baptistery, being of the date of the thirteenth century, the window was necessarily designed to accord with it. Fortunately there are sufficient remains of stained glass of this period to indicate the principles that should guide us at Salisbury, and at Bourges and Chartres in France, and to prove that it was as well understood at that time as the architecture it enriched.

These fine old windows have never yet been surpassed in design or in management of colour. The window illustrates the "Baptism of our Lord," and its antitype, the "Passage of the Red Sea." These subjects, though severely treated, are well and carefully drawn, the features and folds of the draperies are expressed by simple black lines, assisted by a very slight shadowing.

It is in the "Passage of the Red Sea" more particularly that a new treatment of stained glass is adopted. It has been found that the more uneven the various pieces of glass are, the greater the richness of the completed work. It has hitherto been usual to reserve the selvage pieces of glass which are most uneven in tint for the choicest parts of the window. In this window the greater part of the glass has been gradually ground away from one side and afterwards polished. The back grounds of both subjects are composed of great numbers of small pieces of blue glass, varying in tint from a light greenish blue to a purple. The full and somewhat fiery tone of the subjects is relieved by the quiet violet and yellow diaper work on which they are set. The wide border round the whole window is composed of conventional foliage, in which birds, reptiles, &c., are entwined; and the background is a subdued greyish blue; this gives value to the rich blue of the subjects.

The glowing effect of the Saviour's robe in the Baptism is produced by mixing the lighter tints of red, produced by the chloride of gold, with the darker, made from the protoxide of copper; these are neatly united together in the folds of the drapery by the leaden bands.

The window is glazed throughout with a round lead similar in make to the old cast-lead, which has given proof of its quality by doing good service for 800 years. The arms of Dr. Nicholson and of the town of St. Alban's are introduced in the border. Were the position of the window in the Exhibition more favourable, there can be little doubt of the judgement of the public upon its general effectiveness.

The restorations of the Abbey Church of St. Alban's, although effected at a cost of upward of £3,000, leave very wide scope for the exercise of the munificence of future donors, especially in the ornamental work of the monuments, chantries, and chapels. The important matter of drainage has been very thoroughly done throughout the whole of the walls on the north side by removing a large mass of accumulated earth, constructing an air-chamber for intercepting any external damp from coming in contact with the walls. The water is now conveyed by a system of pipes from the leads of each roof into the great drain running parallel with the walls about ten feet distant. The whole of the roofing of the north aisle has been reconstructed, and a portion of the roof of the north transept.

St. Alban's Abbey, which will be adorned with this window, has hitherto been almost destitute of stained glass. The "Act of Mercy" window, executed for Harpenden Church, is another example of the good effect resulting from alternating rich subjects with a subdued ornament. The numerous figures are well drawn and coloured, and the composition contrasts favourably with similar subjects exhibited by Holland in the same department.

MR. MONCKTON MILNES ON THE INTERNATIONAL EXHIBITION OF 1862.

ROYAL INSTITUTION OF GREAT BRITAIN.

AT a recent meeting of the Royal Institution, R. MONCKTON MILNES, Esq., M.P., delivered an address on the "International Exhibition for 1862." The speaker stated that the managers of the Institution had arranged that some discourses should be there delivered, on the most important natural products to be exhibited at the Great International Festival, and had thought it advisable that these special addresses should be prefaced by a few considerations of the nature and scope of this wonderful congregation of the industries and intelligences of the world. He was much flattered at being selected to perform this duty, and could assure the members present that he should come into no competition with the eminent persons that would follow him, but should confine himself to those generalities and common-places which are not always the more displeasing for being in some sort the reflection of their own minds.

It was the habit of this Society to deal rather with facts than speculations, and he would therefore direct their attention to the geographical and political conditions which alone rendered possible such an event as this. It had been written with sufficient accuracy for verse, that—

"The total surface of this spherèd earth
Is now surveyed by philosophic eyes;
Nor East nor West conceals a secret worth—
In the wide ocean no Atlantis lies:
Nations and men, that would be great and wise,
Then knowest, can do no more than men have done;
No wond'rous impulse, no divine surprise,
Can bring this planet nearer to the sun,—
Civilisation's prize no royal road has won."

The accessibility of the ocean-waters of the globe was a first necessity to this end, and this had been now accomplished from the ice-bound fires of Mount Erebus to the grave of Franklin. We could not say quite as much of our knowledge of the land of the world, but we perfectly understood the limits of our ignorance, and could fairly assume that there was no position of the earth yet unsurveyed which could in any notable degree add to our physical science, or extend our observation of the habits and destinies of mankind.

Although great continents are represented in our Exhibition only by their fringes, we can hardly contemplate any such conversion of nature or man as should people the sandy spaces of Africa, the vast pastoral steppes of Central Asia, or those huge fields of the unlimited liberty of animal and vegetable life which stretch in South America from the tropics to the polar snows, with the higher forms of industry, art, and civilisation. It is enough that no longer can Tartar hordes swoop down on richer and fairer lands, and that the sage and saleratus prairies of North America cannot check the enterprising outgrowth of the Anglo-Saxon race.

And this brings us to another necessary condition of our Exhibition, the security of the seas, and the general facility of commercial intercourse. The exceptional piracy which obstructs the trade of the waters of Oceania, and which the energy of Sir James Brooke has done much to repress, was once the custom of the world, and carried with it no notions of cruelty or disgrace. This evil was partially remedied by placing commerce under the safeguard of religion. Where the modern state establishes a factory or a free port, the old state built a temple. Thus the Tyrian Hercules linked together the trade of Greece and Phenicia in a common worship; thus the fane of Jupiter Ammon was the great resting-place and protection of the caravans of the desert; thus the lines of the chief Catholic pilgrimages were the paths not only of all travellers but of all merchants in the middle ages. The interchange of the gifts of God was sanctioned by Pagan and by Christian piety, and the notion of connecting trade with any inferiority of social station or intellectual power, is a perverted remnant of the feudal system, where the jealousy between town and country tended to discredit labour and to idealise brute force.

The speaker proceeded to draw the distinction between ancient and modern trade. In the old Asiatic nations, where influence is still palpable among mankind on the score of authority and the bond of religion, the ideas of free trade and competition would have been incomprehensible. The exclusion of foreigners from the internal navigation of the several countries was universal, and none were permitted even to enter foreign ports, except with the *tessera hospitalis*, or some other symbol of a commercial treaty. Bars were thrown across the mouths of some rivers, as by the Persians across the Tigris after their conquest of Babylon; traces of which impediments to navigation still remain. And in modern Europe the growth of liberal commerce has been slow indeed, and it is one of the happiest privileges of our time that, as regards ourselves at least, we have come to see its consummation. In Sir Dudley North's "Discourse on Trade," published in 1691, the principle is laid down "that the whole world as to trade is but as one nation or people, and therein nations are as persons." But the Hollander and the Portuguese long remained the objects of a commercial animosity, which did not prevent the one from occupying our fisheries up to the very coast, and the other from sharing with us the dominion of India.

The social and political conditions represented by our Exhibition next occupied the attention of the speaker. The whole of this marvellous combination of energy and art is the result of free labour—of the spontaneous industry of mankind. It is not the mere application of local nature to local designs, but the collation and transmutation of most diverse and distinct elements to the use and benefit of our race; the juxta-position of

our coal, and iron have suggested the manufactures of Sheffield, but it is the borax of Tuscany which assists the ingenious labourers of Colebrook Dale. It is the sign and symbol of the general education of the world, which renders it impossible that discoveries can be neglected or arts be lost. The ignorance and superstition which kept mankind in unnecessary physical pain after the invention of the "spongia somnifera" of the 12th century, can no longer check the anæsthetic powers of a beneficial nature, nor would it require a Harvey to revive, however he might be required to develop, the knowledge that perished with the ashes of Særvetus.

But besides the intercommunication of nations in space, the speaker remarked, our Exhibition surely owes much to what he would call the trade of time, the thoughts, the feelings, the interests, that pass from generation to generation; the arts of Greece, the laws of Rome, the religion of the Semitic peoples, the triple elements of modern civilisation. The silent East gave the alphabetic character which has transmitted all the speeches and varied literature of the West; the Brahmin preserves the sacred language in which the linguistic science of modern times traces the mother-tongue of all the Indo-Germanic dialects that pass from mouth to mouth beneath these lofty domes.

The singularity of the circumstance that England should be the scene of this meeting of the nations was next alluded to. It was an illustration of the advantage of our insular position, which being combined with sufficient territory, gave us at once the best political condition of external power and domestic independence. Our greatest danger in history has been not our own conquest, but the conquest of France, which must have absorbed us into the continental system. Now, the peril of our power lay in the rapid political and moral elevation of the other European nations, but we could well afford to sacrifice some individual superiority to the common gain of mankind.

The speaker concluded with noting some of the probable effects of this great jubilee of commerce. Large congregations of men had always vividly struck the imagination, and the jubilee of Pope Boniface so occupied the mind of Dante that he illustrates by it one of his supernatural pictures, and fixed it as the date of his spiritual journey. Such assemblies have always been looked on as harbingers of peace, and we know what were the expectations of 1851. But though that hope has proved delusive, we may yet feel thankful that, with the exception of the American calamity, all the disturbances of the world since that time have been the conflicts of a lower against a higher civilisation, in which the higher has had the mastery. The materials here brought together must impress on the spectators the mutual dependence of nations, and the interests of amity. One of the chief objects of interest would be the various applications of art to industry; advantages perhaps somewhat balanced by the injury of the application of industry to art. As art becomes mechanical, it loses the spontaneous dignity which makes it most divine, and it seems impossible to diffuse and repeat it, without some diminution of its highest faculties. But this qualification does not extend to the relations between industry and science, there the moral is as certain as the material profit; intelligent labour is substituted for the mere exertion of brute strength; the supply of comforts is extended from the luxurious classes even to the necessitous; the diseases consequent on physical hardship are diminished, and the average longevity of man increased. To the progress of scientific education not only the philosopher but the statesman looks for the diffusion of public happiness and the permanence of modern civilisation. If the states that now rule the world are to escape the doom of Babylon and Rome, of Egypt and of Greece, it is in that they have not made their science the monopoly of a caste or a priesthood, but they have placed it more or less within the reach of the individual intelligence of the humblest citizen. Let the education that enables mankind to apprehend and value truth proceed commensurately with the discoveries of science, and the community will gradually but continuously absorb into itself that knowledge which makes decay impossible, and our country may boldly and confidently meet whatever destiny remains for it in the inscrutable designs of the Creator and Ruler of the universe.

MR. NEWTON ON ANCIENT ART.

MR. NEWTON, the keeper of the Classical Antiquities at the British Museum, has just been delivering four lectures at the Royal Institution, on the successive Tuesdays, on the History of Ancient Art, with especial reference to Greece. In the first, he commenced from the earliest period of which there is any record whatever, and showed that, while all sculpture is divisible into two leading classes: 1. Sculptures in the round; and 2. Relief, whether alti or bassi, Art itself may be divided into five great periods, viz. 1. Heroic and partly Pre-historical, from the earliest dawn of art to B.C. 776 (the date of the Institution of the Olympic Games). 2. Semi-historical, from B.C. 776 to B.C. 580. 3. Historical, from B.C. 580 to B.C. 478, the end of the Persian War. 4. The period of Highest Art, from B.C. 478 to B.C. 431, the date of the death of Phidias, and the commencement of the Peloponnesian War. 5. The period of Gradual Decline, marked, however, by the presence of many great artists, such as Lysippus, Polygnotus, Praxiteles, &c., from B.C. 431 to the commencement of the Roman Empire.

In his first lecture Mr. Newton traced the gradual development of some form of Art from the rude stocks of wood and stone of the Heroic times, usually called *terme*, to the primitive idols, made of a central block, with heads, arms, and drapery, added, generally in different materials; of which idols, doubtless, the Palladium Diomed stole from Troy, the figure of the

Argonautic Chryses, and the original Diana of Ephesus, may be considered as specimens. None of these oldest forms (*ἑβανα*) have been preserved; but we may gather some idea of what they were like from the earliest vases, between B.C. 776 and B.C. 580, which exhibit such scenes as the Last Night of Troy, the Altar of the Goddess Chryse, &c. Homer tells us little positively of the art of his period, but much negatively. It is clear that when he speaks of the ornamentation of cuirasses, of the shield of Vulcan, and the embroidery of Helen, he must have seen similar works, some of which we know were preserved (even to the time of Pausanias) in the treasuries of different monarchs, such as those of the Kings of Lydia, of Atreus at Mycenæ, at Orchomenis, or in the great temples, &c. All such works were reliefs analogous to those on the fragments of the chariot from Perugia, now in the British Museum. With them may be aptly compared the bronze bowls found by Mr. Layard in the treasury of Sardanapalus at Nimrud. It is probable, indeed, that many genuine specimens of Assyrian art were preserved till a late time in different parts of Asia Minor, if not in Greece itself. Pausanias's description of the famous chest of Cypselus (which Mr. Newton compared with the bridal *cassoni* of Italy) shows what the art must have been like; for on the chest we learn that there were reliefs in gold and ivory arranged in parallel rows, with their names written over the different personages represented. The same principle is observable on the most Archaic vases.

The third, or historical, period was the most important one described in the first lecture, as this was the time when Greece was teeming with great artists. The cause of the remarkable artistic progress of this time may be not improbably traced back to the fact that about this period magnificent festivals became common, with exhibition of athletic sports. It was also the time when the principal colonies of Greece, at Cyrene, in Spain, and in Sicily were founded, and when the greatest of the early temples at Posidonia, Ægina, Selinus, and in Asia Minor, were commenced. Art was also, doubtless, greatly influenced by the patronage afforded to the Greeks by the Egyptian sovereigns Psammetichus I., Apries, and Amasis, and by the establishment of the Greek factory of Naukratis. Some specimens of the art of this period are still extant, such as the Agamemnon relief at Paris, which was found at Samothrace; the figures from Pollediana, near Vulci; the seated figures from the Sacred Way at Branchida, brought to England by Mr. Newton, and a remarkable inscribed lion and sphinx from the same place; together with some very curious gold ornaments recently found at Camirus. Some of the latter betray Phœnician influence, though among them, also, are genuine Egyptian cartouches. The early coins of Posidonia and Caulonia show also what was the prevailing style at the end of the third period. It is obvious from all these examples that Greek art progressed gradually step by step, exhibiting from time to time the predominating influences of Assyria and Phœnicia, till it at length worked itself clear of the earlier trammels, and was ready to appear in its full force under the giant hand of Phidias.

In his second lecture Mr. Newton handled what for want of a better name may be termed the Phidias period, namely, his fourth division between B.C. 478 and B.C. 431. In this he traced the history of art from the early and hard works of Calamis and Canachus, to those of Myron and Polyctetus, and finally to Phidias himself. He showed that Calamis is especially noticed by Pliny as the first sculptor who represented correctly the muscles of the human frame; and that this was still more true of Myron, who, however, appeared to have cared more for the animal representation than for the indication of the inward spirit. Far greater in many respects than any of the preceding was Polyctetus, who was, however, considered by the critics of antiquity as admirable rather for the grace than for the sublimity of his figures. "His gods," said they, "wanted majesty." During the same time painting was greatly developed; and, perhaps, attained its maximum of excellence in the hands of Polygnotus. It is clear, however, that his early paintings must have exhibited extreme simplicity, as four colours only were made use of. Polygnotus is considered by Aristotle the greatest of Ethical painters, and his style seems to have been chiefly remarkable for great firmness of outline, breadth of treatment, and certain dread of *Chiaroscuro*. No works of Polygnotus have been preserved; but we trace some shadow of their beauty in the vases of the time of Phidias—with scenes representing the leave-takings of heroes, such as Hector and Priam, and priestesses bringing up animals to the sacrifice.

But the hero of the period was unquestionably Phidias, who had attained some eminence at Athens as early as B.C. 452, and who is most known to us by the description of his famous statues of Zeus at Olympia, and of Pallas in the Parthenon, and by the sculptures of the Parthenon itself, a great part of which are now in the Elgin Room of the British Museum. The two great statues above mentioned were composed of gold and ivory, which were plated and embossed, and attached to a central core of wood. This mode of workmanship had been handed down in Greece from very early times. Ivory was, as a substance, the best adapted for the representation of flesh, and afforded great opportunities of skill to the artist himself. These statues were above forty feet in height; and that of Zeus was held by the ancients to be one of the seven wonders of the world.

Of the grandeur of the conceptions of Phidias, and of the beauty of his lines, those can best judge who are familiar with the statues and reliefs now in the Elgin Room. Mr. Newton described at great length the meaning of these sculptures, so far as it is possible now to ascertain it, and showed by ample illustrations the mode in which its general whole might be restored, either from existing monuments, or from some drawings made by Carrey, before the temple was so much ruined, and while many figures, now hopelessly lost, still adhered to its walls. The frieze is generally considered to be the

glory of the chisel of Phidias; and in this style of low relief he has probably never had an equal.

In his third lecture Mr. Newton surveyed especially the period between B.C. 431, the commencement of the Peloponnesian War, and B.C. 333, the rise of Alexander the Great—a period memorable as that in which Socrates and Alcibiades were the two most prominent characters—when the Athenian supremacy was put an end to—and when the corruption of manners, so well noticed in Aristophanes and other writers, was just commencing. Of this period, Praxiteles and Scopas were the two principal sculptors, and in both of these the characters of the later school of decline may be noticed. The gods and heroes of these artists have no longer the sublimity of Phidias, and there is always a direct appeal to the senses. The Venus of Praxiteles was so lovely that long journeys were made to visit her statue at Onidus; we are also told that when Nicomedes of Bithynia offered to pay the whole of the public debt of Onidus on condition that this statue should be his, the Onidian people indignantly rejected his proposal. Praxiteles was one of the first to represent the perfectly nude female form, which alone indicates a remarkable change of manners. It was supposed that the Venus de Medici was a work or a copy of a work by Praxiteles; it is, however, now generally recognised as the work of a much later artist. Though we have probably no specimen extant from Praxiteles's own hand, there are several torsos in different European museums which indicate more or less the style of his school. And there is, above all other ones, the celebrated statue of the Venus de Milo, at Paris, which is an unquestionable Greek work, of a date little, if at all, more recent than that of Praxiteles or Scopas. Of Scopas there was, till the recent discovery by Mr. Newton of the sculptures of the Mausoleum, scarcely any representative in Europe; the Apollo Pythius, however, now at Rome, is probably a bad Roman copy of the statue by him, which was placed by Augustus in the Palatine Temple after the battle of Actium. Scopas was chiefly famous, according to ancient writers, for his treatment of the members of the Dionysiac Theasos, when under the influence of their orgies; and he seems to have exhibited great skill in the development of beauty in connection with strong passion. Some indications of his style we are able to trace in such works as the well-known Baccante with the kid in her hands, and in the reliefs on many fine Roman marble vases with Baccic subjects. Scopas was noticed in antiquity as one of the four sculptors whom Artemisia employed on the decoration of the tomb of her husband Mausolus; and though we cannot determine which were his, there is no reason to doubt that some of the late recovered marbles from Halicarnassus owe their excellence to his chisel.

Mr. Newton's last lecture was devoted to the last period of Greek art—the Macedonian—which may be considered as extending to the commencement of the Roman Empire. It was a time of peculiar magnificence and wealth, when new fields of commerce had been opened out and great engineering works undertaken; when, too, the works of imagination had become daily more feeble; when the ancient purity of the Greek language was broken up, and that dialect was formed of which we have specimens in the Alexandrian Greek of the New Testament. Artists were no longer independent workers—the friends and the instructors of the rulers—they were simply subservient to them, and painted or sculptured to please the greatest men of their day. Thus it is recorded of Alexander, that he declared Lysippus and Apelles alone should record his portrait on their marble and canvas respectively; and, generally, there was an attempt in portraiture to blend the man and the mortal, and to give the royal personage the attributes and the physiognomy of the Deity. Hence it is that this period, defective as it was in great works of the imagination, was eminent for the portraiture it produced, many of which are still unquestionably in existence. Some of the statues attributed to Lysippus doubtless show skill in handling the materials, but they lack the majesty of the earliest artists, and you never forget the artist in the work he has produced. One especial tendency of the school of Lysippus and his followers was his naturalism, the result, possibly, of a reaction towards the study of nature, which, however, ended in a loss of dignity just in proportion to the minuteness with which the natural forms were copied. The heads of Mithridates, Ptolemy, Solon, Philoturus, and Arsinoe, on their coins, show the extent to which the art of portrait busts had been carried. And the seated Aristotle of the Palazzo Spada, and Demosthenes of the Braccio Nuovo of the Vatican, exhibit what was done in sculpture. In ideal subjects, the dramatic element is noticeable as widely preeminent; hence such groups as the Laocoon, which rather represent *tours de force* than actual copies of nature. Other instances may be seen in the Dying Gladiator, and in the group misnamed Arria and Patus; while of the latest Athenian School we have the famous Belvidere torso, so much admired, by Michael Angelo, the Venus de Medici, the Farnese Hercules, and the Fighting Gladiator. To this latest period belong also several fine *camei*, and the well-known Portland Vase.

STUDIES OF MODERN ARCHITECTURE AT HOME AND ABROAD.

By G. R. BURNELL, Esq.

From "ARCHITECTURE OF THE VICTORIAN AGE."

IN one of his earlier works, Victor Hugo said very truly that "quand on sait voir, on retrouve l'esprit d'un siècle, et la physionomie d'un roi, jusque dans un marteau de porte;" and it is precisely this connection between the inner soul of a nation, and the external expression of it in its works of art, which gives to the science of Archaeology its deepest interest. "The noblest study of mankind is" said to be "man;" and so every form

in which he displays his heart of hearts must merit and repay the study of those who endeavour to ascertain the meaning of the various social phenomena which influence or characterise his history. And it is to be observed that the terms of the latter portion of the preceding sentence have not been used lightly; for the monumental arts of an age and of a nation have a strange action and reaction on the people who examine them daily. Properly understood, then, the "sermons in stones" may enable us to supply many blanks in the written stories of past ages, and to revive the living pictures, perhaps long since effaced, of the thoughts, feelings, aspirations, and faith of nations only known in chronicle by their deeds of destruction. History, as we read it in books, is too often a mere record of deeds of war and violence; the power and energy of construction are to be divined from the monuments of an age or country.

It would far exceed the limits which could be allotted to the articles of a publication, such as is now presented to the students of art history (as displayed in contemporaneous architecture), were an attempt made to work out the preceding notions to their natural consequences, throughout the whole of the long period of man's tenancy of this "sepulchral clod." A careful comparison of the works in course of erection in the most important cities of the civilised world, or which have been completed within our own time, will, however, serve well to "point the moral" sought to be demonstrated; and indeed society has passed through such marked changes within the period which has elapsed since 1814, that the art history of that time may serve to elucidate many questions which would throw a reflex light on those which have gone before. The general diffusion of education, the improvement of the analytical process of investigation, the development of the means of intercommunication, the great strides made in manufacturing industry and commerce, and the thousand ways in which man has recently, in sober truth, "made fire, flood, and earth the vassals of his will," have produced results so startling that society has, in the last half-century, been more changed in all its external expressions than it had been in any previous two or three centuries. What is the moral to be learned from this restless, ceaseless striving after a perfection which recedes as we advance, and in the pursuit of which we find that the gain of to-day only opens up the want of the morrow? What are the prospects, what the dangers, hopes, and fears to be anticipated from the spirit now abroad? Is there "good in everything" going on around us, either for the moral or for the intellectual advancement of our race? and have late years furnished lessons for our guidance or for our warning? These are noble subjects for enquiry, and it is proposed in this and in some subsequent articles, if favourably received, to discuss the bearings of recent architectural and archaeological revolutions upon their solution.

The first enquiry which presents itself, is the one as to whether periods of excellence in art correspond with any peculiar conditions of social organisation? for, to limit our observations for the present to the two leading nations of Western Europe, England and France, we may observe that within the last half-century, there have been three distinctly-marked phases in the history of architecture, corresponding rudely with the great political dates of 1814, 1830, and 1848. Of course, Architecture, in the two countries thus named, has assumed characteristics which are in the respective cases, "racy of the soil;" just as, during the period of the great Revival of classical art the architectures of Florence, of Rome, and of Venice bore the impress of the respective states of society amongst which they arose; and as must always be the case when the rude materials employed, the atmospheric conditions, and the social organisations of nations, differ notably. But in spite of these local modifications, it is easy to perceive that every one of the great changes in the architectural expression of the two countries named, have borne a marked parallelism with the contemporary political events, the nature and extent of which it must be of interest to study.

Previously to 1814 the iron despotism of the Empire of the first Napoleon had effectually crushed everything like originality of thought in the French people, and had drilled the national mind into the uniformity of a camp. The architecture of his day bore indeed the physiognomy of the Emperor; and it was modelled upon so lifeless an imitation of Roman imperialism, that it is easy to understand the cry of the aspirers after freedom of thought who sighed, almost in despair, for the man "qui les délivrerait de ces éternels Grecs et Romains." There was, however, a solid grandeur, a bold, simple, massive effect about such buildings as the Bourse, the Madeleine, the Arc de l'Etoile, l'Arc du Carrousel, la Colonne de la Place Vendôme, the Marché St. Germain, the Entrepôt des Vins, the Abattoirs de Paris, the Pont de Jéna, &c., which must always preserve the buildings of this period from contempt, even if they should be regarded with dislike. They were stiff and affected, it is true, but they were not little in any sense of the word. When Napoleon fell, however, and the Bourbons introduced the freedom of constitutional government, and when men's minds (which had during the long wars of the Republic and of the Empire been concentrated in the great struggle for existence at first, and then for power) could be turned to the cultivation of the arts of peace, a great change soon came over the spirit of the nation, which displayed itself in the altered character of its architecture; perhaps not quite so distinctly as it did in the arts of painting, sculpture, music, and in literature and philosophy, but still perceptibly so. The churches of Notre Dame de Lorette, of St. Vincent de Paul, the Chapelle Expiatoire de la Rue d'Anjou St. Honoré, the completion of the Chamber of Deputies, the commencement of the Palais du Quai d'Orsay, may be cited as illustrations of the public buildings of this period; but the private buildings of the principal towns of France display the tendencies of the architecture of the "Restauration" in a still more decided manner. There is to be found in those buildings erected shortly after the fall of the Empire, as it

were, a spirit of revolt against the rectilinear style which had prevailed during the days of the crowned soldier; and towards the end of the Restauration the love for mediæval art began to display itself simultaneously with the brilliant appearance of the romantic school of literature. The galleries Vero-Dodat, Choiseul, Colbert, des Panoramas, the theatres du Vaudeville, Ventadour, &c., may be considered to represent the former phase of French architecture; the reconstruction of the Maison de François 1^{er}, and the commencement of the Ecole des Beaux Arts, of the second. But France had been so exhausted by the wars of the Empire, by the foreign occupation, and the perpetual struggles and contests of parties during the short period of the reigns of the returned Bourbons, that the results of the efforts then made to improve the state of architecture only became apparent after their successor had reduced society to something like order after the fearful outburst of demagogism of 1830.

During the same period (that is, between 1814 and 1830) architecture in England passed through the phase characterised in the beginning by the productions of Wyattville, Seane, and Nash, or of Jupp, Cockerill, senr., and Hardwick, senr.; and towards the end by Smirke, Inwood, Wilkins, Jorden, Bedford, Decimus Burton, B. Wyatt, Rickman, Britton, and Pugin, though the three last-named artists were rather archaeologists than practical architects. The buildings of London, and indeed of England generally, were then as deficient in taste and artistic feeling as it is possible to imagine, externally, at least; and internally, more attention was paid to physical gratification, to comfort, than to anything like intellectual expression. Practically, we had long been excluded from all interchange of ideas with the rest of the world by the struggle we had sustained against the French Revolution; and having been victors in that struggle, we had fancied that others ought to learn from us, not we from them. Our arts, and our architecture in particular, at this period, were intensely local in their feeling and mode of expression; and as our local peculiarities had become exaggerated through our isolation from the rest of the world, they led us to the adoption of a style of architecture for many years which can now only be looked back upon with feelings of shame and of regret. Buildings like the Custom House, the old parts of Buckingham Palace, the Law Courts of Westminster, Regent Street, the Regent's Park Terraces, the Pavilion at Brighton, &c., are now thought to be so intensely ugly that the only surprise we can feel is, that they should ever have been erected. Yet they were admired at the very same time that the gates at Park Corner, Covent Garden Theatre, the Post Office, St. Pancras Church, the churches in the Waterloo Road, at the corner of Kensington Common, the Lothbury corner of the Bank, &c., were in course of construction, and when the revival of mediæval art was beginning to make itself felt. It would really seem that during the great struggle of the Revolutionary wars all the energy of our nation had been turned to meeting the necessities of the contest; and that though our commerce, our manufactures, and our means of intercommunication had attracted the attention of our rulers, because they furnished the elements of material strength, the finer arts had been designedly neglected, as being likely to lower the moral tone of the nation. When peace came, the artistic feeling of England no longer existed; and the nation which had produced the Reynoldses, Gainsboroughs, Chamberses, Adames, Bacons, and Bankses of the latter end of the eighteenth century, was content to admire the Wests, Fuselis, Wyattvilles, Soanes, Westmacotts, and Nollekinses of the beginning of the nineteenth. The imitation of pure Grecian architecture, which became fashionable about the end of the Regency, was, in its way, a vast stride towards a purer and nobler taste; but the reason why we thus adopted the severely beautiful style of the Ionian and Doric rectilinear forms, whilst they were rapidly passing out of fashion in other countries (for there is fashion in these things), must long remain a mystery. It is curious that the building materials we use, and the climatological conditions of England, are far from being so well adapted to the trabeated architecture of the Greeks, as are the fine building stones and the clearer atmosphere of France. Yet, in our case, we persisted for years in carrying out huge horizontal openings by the use of cement and bricks; whilst our neighbours turned by preference to the practice of Vignola and of the Italian architects of the end of the Risorgimento for models and instruction. The latter had, like all who sought their inspiration from the study of classical Roman art, adopted vaulted construction instead of the trabeated one; and we therefore find that the French architects of the "Restauration" had continued in the same course.

(To be concluded in our next Number.)

THE BONES AT ROTHWELL.

MUCH interest has been lately excited amongst the archaeologists of Northampton, as to the origin of the human bones which are stacked, in ghostly order, in a vault at Rothwell. This crypt was discovered nearly an hundred years ago, by the breaking in of a vault when digging a grave: and various have been the speculations concerning them. Some have supposed, from their huge proportions and number, that they were skeletons of "The grand old Sea-kings of the Northern Continent, the stalwart champions of Odin," and Major Whyte Melville, the author of "Holmby House," has suggested that "the vault in which these remains are deposited was a receptacle devised by the Saxons as a burial-place for their Danish foes; that the Saxons stored them carefully in their position, in order to visit at intervals, and in triumph, these trophies of their prowess." Some have supposed them to be the remains of the slain of battles during the Wars of the Roses, or of the Civil War, whilst others have suggested that they were the victims of the Great Plague. At the last monthly meeting of the

Committee for Local Antiquities, in connection with the Northamptonshire Architectural Society, a very interesting paper was read on the subject, by SAMUEL SHARP, Esq., F.G.S., in which he relates the account of his two visits to the crypt, with Mr. J. T. Irvine, the superintendent for Mr. G. G. Scott, in the restoration of St. Sepulchre's Church, Northampton. Mr. Sharp calculates that the maximum number of skeletons which are represented by the bones in this crypt is about 3,825, while Major Melville supposes that there could not be less than 30,000; that there is no reason to believe that they are all skulls of adults, or of males, and that the "ghastly shattering wounds" were doubtless "injuries sustained by the *dry bones* from mattock and spade in their exhumation previous to their final deposition in this crypt." This plain solution of a problem which has puzzled many antiquarians entirely destroys the romance with which the clever novelist surrounded it. Mr. Sharp shows, that in the history of the world it would be impossible to find more than a dozen battles in which 30,000 had been slain on one side; that, indeed, the crypt did not exist in Saxon times, but was built about the year 1180. "The bones, therefore, had not been deposited before the latter half of the thirteenth century," and he considered that "there were reasons for concluding that these bones were not placed in the crypt until a much later date." "It is evident," he continued, "from the presence of the fresco painting, and from the windows, that this crypt was used as a chapel, and for the holding of services. Crypts, in the old Catholic times, were used both as places of sepulture and as mortuary chapels, in which masses were said for the repose of the souls of the builders, or of those whose bodies were deposited therein; they were also used for the midnight Easter services, and for offering the prayers for the dead on All Souls' Day. It is not likely, I think, that this crypt would be appropriated to any other purposes, until the original uses had died out—possibly not before (or much before) the time of the Reformation. I do not think that there were any very remarkable circumstances connected with the deposit of these bones. Had there been, surely some record or tradition would have remained to us. The number is not twice that of the existing population of Rothwell, and not greater than (nor perhaps differing materially in character from) the bones which might be exhumed from any well-filled churchyard, the soil of which was adapted for their preservation. I do not think that the crypt has been used as an ordinary charnel-house, in which the bones have gradually accumulated; or it would probably have been continued in that use until now. I think that we are warranted in the conclusion that the bones have been all deposited at once, and the place then walled up; and I would suggest, as the most rational way to account for all the facts, that some perhaps old and unused burial-ground, or some portion of the existing burial-ground, being required for other purposes, was cleared of its human remains, which, with reverential regard, were here carefully bestowed, in this consecrated receptacle, which was ready at hand, and which had outlasted its ancient uses."

CHURCH, CHAPEL, SCHOOL, AND OTHER BUILDINGS.

BRISTOL.—The committee of the Bristol Diocesan Architectural Society have reported very favourably of the designs for the proposed district church of St. Martin's parish. The Church Extension Society of that town have granted £100 towards the project. Mr. W. J. Hopkins is the architect.

ROMAN CATHOLIC CHURCH, ST. LAWRENCE O'TOOLE.—The completion of the tower, and erection of a spire thereon, in connection with the Roman Catholic Church of St. Lawrence O'Toole, are being proceeded with. The spire will be a broach, and have two rows of spire lights, with a gilt cross at its summit, which will attain an altitude of about 200 ft. above ground line. Mr. John Bourke is the architect, and Messrs. Murphy and Son are the contractors.

ST. MARY'S CHURCH, WHITTLESEY.—This church, which has lately undergone considerable improvements, was re-opened for divine service on Wednesday week. All the stone work has been scraped, which brings out the beautiful masonry to great advantage, and shows off the noble arches and pillars to that beauty for which they were originally designed. The reading desk and pulpit are of oak, built and beautifully carved by Messrs. Ruddle and Thompson, builders, of Peterborough, and are allowed to be of a very high class. The late Sir Harry Smith's memorial chapel adds greatly to the beauty of the church, in which is erected a very splendid marble monument, surmounted with a life-size bust of the gallant General, and a very appropriate inscription.

NEW SCHOOL AND CHAPEL, UPPINGHAM.—The tender of Messrs. Halliday and Cave, of Greetham and Oakham, has been accepted for the new school and chapel at Uppingham, and the work of demolition has already been commenced. The architect is Mr. Geo. E. Street, of London. The buildings will be very handsome and substantial, in the decorated style.

On Tuesday week, a Wesleyan day-school was opened at Crewe. The edifice is in the Gothic style, and cost, including £200 for land, £1,316 4s. 7d., towards which Government gave £359 10s.

On Wednesday week a new school and school-house was opened at Coombe, the site of which, as well as the greater part of the material required for the school, were given by the Provost and Fellows of King's College, Cambridge.

BEDMINSTER.—A plain and substantial school-room is about to be erected for the new church of St. Luke's, Bedminster, Bristol. The foundation stone is to be laid on Thursday, the 3rd of July.

The foundation stone of a new Wesleyan chapel was laid on Tuesday

last, at Middlesborough. The cost of the building is to be £4,400, and will be a mixture of various styles of architecture, the Byzantine predominating.

DRIFFIELD.—A new Baptist chapel was opened on Wednesday week, at Driffield, Yorkshire. Mr. Haw, of Beverley, was the architect.

DAWLISH, DEVON.—A private chapel was opened on Tuesday week at Luscombe Park, near Dawlish, the seat of P. Hoare, Esq., for the use of his family and the tenantry on his estate. Mr. Scott, of London, was the architect, and the edifice is built in the transition style. In the building of the apse, nave, and aisle, three different descriptions of stone have been used—viz., Bath, Stoke, and Mansfield. The arcade is constructed of coloured stone and Devonshire marble, the latter being highly polished. The ceiling springs from pillars of native and beautifully polished marble. The windows are of richly stained glass. Those in the chancel represent various scenes in the life of our Lord up to the period of His ascension. The other windows are filled with various Saints and Apostles. To each of the windows are two beautifully variegated marble pillars, with elaborately carved capitals. The paving of the upper altar is tastefully inlaid with Devonshire marble; and the lower altar, with the same marble, and Minton's ornamental tiles. The steps of the altar are likewise of the same, the whole presenting a rich colour. The nave and aisle are paved with black and red quarry stone laid to design. The whole of the carving work has been admirably executed. The seats, which are very superior to the ordinary pattern, are made of cedar, the principal part of which was grown on the estate. The doors are of the old oak style, and handsomely made. The exterior makes no pretension to architectural display.

The foundation stone of some new schools was laid on Wednesday week, at Prickwillen, Isle of Ely.

The corner stone of the new schools for the parish of Ravenstone, Buckinghamshire, was laid on Wednesday week.

The foundation stone of a new Wesleyan chapel has been laid at Lowestoft. The edifice is in the Italian style, and will cost, with the site, over £3,000, and it will seat 1,200 persons.

THE RESTORATION OF THE CHANCEL OF THE COLLEGIATE CHURCH, WOLVERHAMPTON.—Five tenders have been received for the rebuilding of the chancel of this fine old church, in accordance with the restoration of the nave and transepts after the designs of Mr. Christian, and that of Messrs. Higham, of Wolverhampton, has been accepted. The amount of the tender is £3,295 without, and £4,025 with an apse. The total cost will exceed this, however. The committee have already obtained £3,800, of which the Duke of Cleveland, as lay impropiator, and the Ecclesiastical Commissioners contribute £1,000 each. The present chancel was erected subsequent to the rest of the church, and with which it is in striking discordance.

DOWN CATHEDRAL.—The alterations and improvements at present going on in Down Cathedral are progressing with much rapidity.

SWANSEA.—On Whit Monday, the foundation stone was laid of the new mission chapel, Quarry Street, Swansea.

WHITECHURCH.—On Monday last, the foundation stone was laid of the new Wesleyan day and Sabbath schools at Whitechurch.

NEW IRON CHAPEL AT THE EXHIBITION.—Several gentlemen of different denominations have raised £500 or £600, with which a site has been purchased immediately adjoining the stand for the sale of Bibles of different languages, opposite the Exhibition. A neat little iron chapel has been erected, which was opened on Tuesday for divine worship. The site cost £180; the building about £400 more; and the edifice will hold about two or three hundred persons.

ST. MARTIN, BLADON, OXFORDSHIRE.—This remodelling of a modern church is by Mr. C. Buckridge, of Oxford. The present building is a mere conventicle, built by the Duke of Marlborough. The chancel, and a south aisle, to its western half, are new, as also is the arcade between the nave and its south aisle. A new north-western porch is added; and the windows, buttresses, &c., of the remaining part of the fabric, have been renewed. The internal arrangements are excellent. The style is a very early pointed. The arcade is of three arches, rising from comparatively lofty cylindrical shafts. The chancel arch has corbelled shafts. The east window is an unequal triplet of tall lancets, under hood-moulds, and set on a tilted horizontal string-course. The tower is a little too low, the belfry-stage not rising clear above the crest of the nave roof. The said belfry-stage has two light pointed windows, separated by a shaft, with a trefoiled circle in the head. The tower is capped by a low, octagonal, broached, shingled spire. Inside we may notice with commendation the high level of the eastern triplet (which is shafted internally), leaving room for a good reredos over the altar; with curtains on each side, against the east wall. The reredos is to be of alabaster, with incised ornaments, filled with coloured cerements.

DURHAM CATHEDRAL.—The restoration of the chapel of the Nine Altars is now in full progress, under the direction of Messrs. Walton and Robson. All the old shafts of fossil marble (some containing remarkable madrepores) are being repolished by machinery; and where this cannot be done without lessening their diameter, or where shafts are entirely wanting, these are to be renewed. The marble contract alone is taken at £1,000, irrespective of scaffolding. Broken vases will be carefully restored, ruinous neckings to caps inserted in stone, *sculpture untouched*, although very much mutilated. Whitewash will be removed by potash-water and Manchester card. In fact, this noble specimen of thirteenth century work will be cleared of the defilements which have so long disgraced it, and its great beauty brought to light.—*Ecclesiologist* for June.

AN ENGLISH CHURCH IN NAPLES.—A church in connection with the English establishment is about to be erected in Naples. One of the acts of Garibaldi, when Dictator in Naples, in 1860, was to present to the British residents a valuable piece of ground, most conveniently situated in the best part of the city, as the site for an Anglican Protestant church—a circumstance which derives all the more interest from the fact that under the late Government English Protestants were forbidden to worship except in a room, and that room in the Consul's residence. The British community at Naples are attempting to raise a sum of at least £5,000, which will include church, schools, teacher's house, and parsonage. The church is to cost £4,000, and to contain 600 sittings. About £1,500 has been contributed in Naples and £800 in England. The British Government, by the terms of the Consular Act, is empowered to meet whatever sum is collected upon the spot by an equivalent grant.

ST. PAUL'S CHURCH, BEDMINSTER.—The interior of this sacred edifice is, we understand, undergoing a course of repainting and decoration, at the sole expense of Mr. Daines, the senior churchwarden, and will be completed towards the end of the present month.

CLIPSTONE BAPTIST CHAPEL, NORTHAMPTONSHIRE.—This chapel has recently undergone considerable improvements, under the superintendence of Mr. E. F. Law, architect, Northampton, at a cost of £450.

ARCHITECTURAL ASSOCIATION.

A MEETING of this body was held at the rooms, 9 Conduit Street, Regent Street, on Friday evening; Mr. THOMAS BLASHILL, V.P., in the chair.

New Member.—Mr. Robert H. Burdon, Berners Street, Oxford Street, was unanimously elected a member of the Association.

Professional Practice and Charges.—Mr. PARAKE moved that the honorary secretary be requested to apply for an official copy of the document recently agreed to by the Royal Institute of British Architects, relating to professional practice and charges of architects.—Mr. T. ROGER SMITH seconded the motion, which was unanimously agreed to.

Visits to Old Buildings.—Mr. R. O. HARRIS thought it would be well if they could organise a scheme for visiting, during the summer, several of the old buildings in London and the neighbourhood, such as Westminster Abbey, St. Paul's, and St. Alban's Cathedral, the members of the Association being headed by some gentleman well known for his information and interest taken in the objects visited. Such visits would be very profitable, and at the same time form the subject of interesting study.

The CHAIRMAN thought the suggestion a most excellent one.—Mr. T. ROGER SMITH thought they might make some arrangement on the subject before the next meeting.—Mr. C. H. F. LEWES said, that in order that all the members of the Association should have the privilege of paying such visits as those proposed, all the offices should close at 2 o'clock on Saturday, which was not the case at present. It was then agreed to, that arrangements for a visit to Westminster Abbey should be made before the next meeting.

Donations.—Mr. C. H. F. LEWES announced several donations to the library; and it was stated that information had been received from one of the honorary secretaries of the Institute of British Architects, that it was the intention of that body to present the Association with a number of duplicate books, which could be spared from the library of the Institute.

Proposed Architectural Alliance.—Mr. T. ROGER SMITH moved the following resolution:—"That this Association send a deputation, as requested, to attend a meeting of delegates who are summoned to deliberate upon the proposal for an Architectural Alliance, but that the delegates be not empowered either to grant or refuse the adherence of the Association to the proposed alliance, the Association declining to come to any decision on this point, until after receiving a report from the deputation."—Mr. PARAKE seconded the motion, which, after a long discussion, was agreed to. The first meeting of delegates takes place in London on the first of July. The following gentlemen were appointed the delegates from the Association:—The President of the institution, *ex officio*; and Messrs. T. Roger Smith, A. W. Blomfield, M.A., and J. A. Bunker.

Nomination of Office-bearers for the ensuing Year.—The following gentlemen were nominated as office-bearers for the next year, and they will be balloted for at the next meeting. *President*, Thomas Blashill; *Vice-President*, R. Norman Shaw.

Ordinary Members of Committee.—A. W. Blomfield, M.A., J. A. Bunker, R. Walker, R. P. Spiers, W. Paris, W. Gritten, Jun., C. H. F. Lewes, G. B. New, E. J. Tarver, T. Brown, J. Clarkson, E. L. Paraire, — Hendry. — Molecy, T. Goodman, and C. N. Beasley.

Honorary Treasurer.—Charles J. Adams.

Honorary Solicitor.—Francis Truefitt.

Auditors.—J. W. Penfold, J. M. Rickman.

Curators.—C. H. F. Lewes, and J. W. Walter.

Honorary Secretaries.—Charles J. Adams, and H. Attwood Reeves.

PLOUGHMEN'S COTTAGES AT SAUGHTON MAINS, NEAR EDINBURGH.

WE had the pleasure of examining, a short time since, a row of four new and improved cottages for ploughmen, on the farm of Mr. Dickson, of Saughton Mains. They occupy a slightly elevated position above the road leading past the farm towards Corstorphine; and when the hedge at present in front is removed, and the slope down to the road neatly laid with

gravel, as Mr. Dickson proposes, the cottages, with their neat and substantial stone fronts and blue slated roofs, will have a pleasant and comfortable appearance. Each tenement has four apartments in addition to a store-room, which is about 5 ft. 6 in. by 3 ft., and lighted by a window 4 ft. high, and 1 foot 6 in. wide.

When you enter the outer door, which is 3 ft. 6 in. wide, you find yourself in a lobby, 4 ft. by 5½ ft. or so. On your right is the door leading into the kitchen, an apartment of 14½ ft. in length by 11½ ft. in breadth, and floored with tiles. It is well lighted by a window 3 ft. wide by 4 ft. 6 in. high, made to open in the centre. The fireplace is nearly in the centre of the east wall of the kitchen, and there is a snug nook for the gudemans chair on the left of the fireplace. Almost opposite the kitchen fire is the door opening into the room, which is 14 ft. long by 7½ ft. wide. The fireplace occupies a corner near the window, and which is 2½ ft. broad, with a height of 4 ft. The floor is boarded, and with a fire the place must be exceedingly cosy, and even without a fire the heat from the kitchen will prevent its ever becoming chilly.

The other two apartments are smaller—they are light bed-closets, indeed, with plenty of space to move in, and room for a small table in the recess of the window. The dimensions of each are 8 ft. 2 in. by 6 ft., and each is lighted by a window 1½ ft. wide by 4 ft. high. Both open from the kitchen, and are fitted up with iron bedsteads. The floors of these rooms are also boarded. All the windows are made to open, and thus a fine current of fresh air can be made to play through the apartments at any time, without the door being opened. The rooms are also supplied with wooden shutters.

The kitchen and large room are each fitted with grates, adapted to their respective needs, and all the walls and ceilings are lathed and plastered. The height of the rooms to the ceiling will be about 9 ft.

Mr. Dickson has contrived to get rid of the offensive appearance usually presented by coal-cellar, privies, &c., in a way at once effective and artistic. Joined to the end cottage there is a wall, whose broken outline imparts to it a kind of fortress-like character. Behind this is concealed, not dandy ordnance pieces and piles of cannon balls, but the outhouses—unseemly to the eye, though essentially necessary to domestic life. This wall is about 10 feet high, the effective depression in the centre being about 1 ft. 2 in. in depth.

The coal cellars are each 8½ ft. by 5 ft.; the ashpits 5 ft. 4 in. by 4 ft. 7 in.; and the privies 5 ft. by 3 ft. The outside walls of the cottages are 2 ft. in thickness, and 9 ft. 2 in. in height. The slope from eave to ridge is 8 ft.; and the highest of the chimney stalks 3 ft. above ridge.

The total cost of each cottage, everything included, was about £110 to £115.

NEW FREE CHURCH AT PENICUIK, NEAR EDINBURGH.

BUILDING operations have just been commenced in the erection of the above church; it is to be erected at the south end of the town, on the road from the railway station, and is designed by Mr. Frederick Pilkington, architect, of Edinburgh. The new church will add another conspicuous feature to the architecture of the town. The tower and spire are to rise to the height of 100 feet. The spire will be slated, and will have coronals of ornamental iron-work at the foot, and also at the four spire-lights. The tower is plain till it rises to the top story, which is octagonal, with pinnacles and decorative windows alternately on the faces. The object of confining the ornament to the highest part of the tower, is becoming more and more appreciated by architects, as it obviously gives a greater appearance, and indeed reality, of solidity to the structure, and places the ornament where it is best seen.

The principal entrance to the church is through the tower, by a massive archway, the staircase to the gallery being also in the tower. The lower part of the end of the church is an open arcade of four arches, with columns and carved capitals instead of mullions, the upper part of the gables being occupied by a large five-light window, with plate tracery. The middle part of the tracery is a six-foil light, richly carved, and surrounded with smaller lights, composed of cinquefoils, quatrefoils, and trefoils.

The two sides are occupied by three coupled two-light windows, and the end is penetrated by a large window of a spherical triangular form, with three larger and three smaller circles, converging to a centre, consisting of a double triangle, pierced and foliated. The session-house is placed at the rear of the church, and the chimney, so often put out of sight as a blemish, is taken advantage of so as to enhance the architectural effect of the building. The height of the church, to the ridge of the roof, is fifty-two feet. The roof is constructed in two slopes, the break being occupied by an ornamental ventilator, running all round the church. The entrances to the church are so arranged that the congregation enters by one door, and exit can be obtained by four doors. The interior is fan-shaped; this secures the obvious advantages both of better hearing and better seeing of the preacher, objects not always studied to the extent they deserve in Presbyterian places of worship.

The gallery, which is seated for 150, is confined to the end of the church, opposite the pulpit; the seats are all to be open with carved ends, and sloped at a comfortable angle. The roof will be of open timber-work, simple, but effective.

The estimated cost of the whole structure is £2,050, and the church is expected to be ready in the course of next year. The contractors for the works are Mr. Thomson, mason, and Mr. Tait, wright, these being the chief contractors, all of Penicuik.

GENERAL ITEMS.

CUPAR CORN EXCHANGE.—In 1859 a movement for the erection of the above was originated. The foundation was laid in August, 1861, with Masonic honours. The design has been prepared by Mr. Campbell Douglas, architect, of Glasgow. The building, when finished, will be a neat and elegant edifice of the gothic style. The entrance porch, the only part exposed to view from the street, is to be surmounted with a light and handsome spire, rising to the height of one hundred feet, while the side next to the school-hill is splendidly relieved by a range of dormer windows. The interior of the building will display an equal amount of good taste and design, having the appearance of a beautifully proportioned hall, of the size of ninety feet long by fifty wide, with a circular roof of about forty-five feet in height at the greatest altitude, and supported by cast-iron girders, spanning the whole width. The building will be lighted by a double range of windows in the roof from end to end, and at night by three large and powerful sunlights, with which is connected an apparatus for ventilation. At the north end of the hall ample accommodation is provided for the business of the Exchange, in the way of committee and sitting rooms; and at the entrance there is a ladies' ante-room, and orchestra above, in the event of the hall being used as an Assembly or Concert room. The stalls are all constructed so as to be removed at will, in order to their being used as supports for the flooring of the orchestra, and accommodation is also provided for the storage of the whole seating in the hall, so that the area may be left perfectly free for the purposes of the markets. The estimated cost of the whole is 4000*l.*; and it is expected that the buildings will be finished and opened this year.

COURTENAY v. LANDER and BEDELLS.—A copy of the award made by Wm. Cole Beasley, Esq., of the Inner Temple, has been received by us, and we are enabled to say that the adjudication is in favour of the defendants, the Rev. Anthony L. Courtenay having to pay the costs on both sides. It will be a source of gratification to the profession generally to know that in the only two cases of importance of which there is record of actions brought against architects—viz. that of the *Middlesex Magistrates v. Dankes*, and the present action—both have issued in the entire exoneration of the members of the profession from the charges made against them.

THE MEMORIAL TO PRINCE ALBERT, ABERDEEN.—We believe, says the *Aberdeen Herald*, the committee have had one or two meetings on the subject, both of the form of the statue and the artist to whose hands it is to be assigned. It is said that Baron Marochetti has been selected, subject to Her Majesty's approval. We hope this is true, as such a decision would, we think, give general satisfaction. Marochetti is a sculptor whose works do not deserve unqualified approval, as we need go no further to see than the right fore-leg of King Richard's horse in front of the Houses of Parliament; but he has the great faculty of expressing power and dignity with simplicity and grace, and such a power is not the common gift of all who practise the plastic arts with success. The statue is proposed, we believe, to be of bronze; and the site suggested is on the wooded declivity of Union Terrace, adjacent to Union Bridge.

REMOVAL OF ST. THOMAS'S HOSPITAL.—After a very long and severe contest with the authorities of the South-Eastern Railway the governors of the hospital have at length come to a resolution by which it will be relieved from the dangers which would probably be encountered by the patients from exposure to the noises necessarily incidental to close proximity to such railway stations as the South-Eastern and London and Brighton. Camberwell, Brixton, Streatham, and various other places have been named from time to time as eligible sites for the hospital, while, on the other hand, it has been warmly contended that, if at all practicable, a metropolitan site should be secured. The authorities of the hospital, after diligent search and anxious inquiries, have at length been able to adopt a course which it may be hoped will prove satisfactory to all parties concerned. The Royal Surrey Gardens, situate in Walworth, and about a mile and a quarter from the three great metropolitan bridges (London, Blackfriars, and Westminster), will in the course of a very short time be the spot on which the new hospital will be erected. All the arrangements for the purchase money have been made, and the usual amount of deposit lodged. It will be, of course, some little time before the ground can be cleared and the new building raised, but there will be no unnecessary delay, and in the course of a few months the patients will be in a position to be removed. The site now occupied by the hospital will then be devoted to the purposes of the South-Eastern Railway Company.

A PUBLIC PARK FOR BARNSELY.—About twelve months since Mrs. Joseph Locke, widow of the eminent engineer, in order to mark the connection of her husband with the town of Barnsley, in addition to giving £2,000 for the foundation of scholarships in the Grammar School, and £1,000 in aid of the Catholic schools, offered to present the town with a park, if a suitable site could be found. In accordance with that desire she caused a piece of ground, about 17 acres in extent, close to the town, to be purchased and laid out. The whole has been enclosed, and now forms a magnificent recreation ground. Provision has been made for cricket-playing, bowling, and a variety of other games. On Whit-Monday the ground was handed over to the Board of Health, as the representatives of the town. The shops, without exception, were closed, and every street and lane was profusely decorated with flags and streamers. The sight was most picturesque, more especially in the principal streets, where almost every house had hung out a banner.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—An ordinary general meeting of this body will be held on Monday next, when Mr. Arthur Ashpitel, V.P., will read a paper entitled "On some of the Architectural Drawings in the Royal Library at Windsor, exhibited by command of His late Royal Highness the Prince Consort, by B. B. Woodward, Esq." At the same meeting Mr. E. Welby Pugin, of 14 Buckingham Street, Adelphi, will be balloted for as a Fellow of the Institute.

ANNUAL DINNER OF THE ARCHITECTURAL ASSOCIATION.—The annual dinner of this body took place at the Whittington Club, Arundel Street, Strand, on Tuesday evening, when a large number of the members of the Association were present. The chair was occupied by the President of the Association, Mr. A. W. Blomfield, M.A., and the vice-chair by Mr. Thomas Blashill, the Vice-President. The usual loyal and patriotic toasts having been disposed of, the CHAIRMAN gave the toast of the evening—"Success to the Architectural Association"—which was drunk with the greatest enthusiasm. Mr. Blashill responded; after which a vote of thanks was passed by acclamation to the outgoing office-bearers for their services during their year of office. The dinner and wines gave the utmost satisfaction, and a very pleasant evening was spent by the company.

IMPROVEMENTS IN PARIS.—The improvements now being made in the north-western portion of the Quartier Rochechouart are rapidly approaching their termination. The new street to the left of the Abbatoir Montmartre is nearly finished, and many houses are in course of erection to the south of the Avenue Trudaine, on the site of the old gasworks, where the Rue Bochart-de-Saron is to meet the Rue de Laval, about to be prolonged to the Rue Rodier. But those works are trifles compared with the turning of the course of the Aqueduc de Ceinture, now in progress, from the Rue de Dunkerque to the Rue des Martyrs. This alteration is rendered necessary by the direction of the new streets. The aqueduct will be open from the Rue de Laval to the Avenue Trudaine, from which point it will be tunnelled, at a depth of fifteen metres below the surface, and ten shafts have already been sunk. This aqueduct, one of the principal aquatic arteries of the capital, is 4,033 metres in length, extending from the Canal de l'Oureq to the reservoir at the top of the Rue du Rocher, near the old Barrière de Monceaux. From different points of it mains are carried to the Faubourg St. Antoine, across the Pont d'Austerlitz to the reservoir of the Rue St. Victor, near the Jardin des Plantes; to the Château d'Eau, and across the Marais and the Ponts Marie and de la Tournelle to the left bank; others by the Ponts-au-Change and St. Michel to the reservoir in the Rue Racine; by the Palais Royal and Rue du Bac to the reservoir in the Rue de Valenciennes; also to the Place de la Concorde and the Champs-Élysées.

THE SKELETON OF RICHARD III. has been discovered at Bow Bridge, Leicester—at least so say some of the antiquarians of that town. Tradition and history both relate that the remains of Richard III., when taken up from their grave in the Church of the Grey Friars, Leicester, were carried away by the multitude, and thrown over the Bow Bridge into the river. The bones recently found, however, bear not the slightest resemblance of having been struck or fractured, whereas Richard's body was "hacked to pieces." Richard died at the age of 35, and the bones discovered are stated to be those of a man apparently 30 years of age.

SCARBOROUGH PIER AND IMPROVEMENT COMPANY.—The proposed beautiful public works in Scarborough, "the Queen" of the watering places, are likely to be speedily commenced, as they have received the unanimous support of a great public meeting in that romantic and popular town. When we consider that Scarborough has increased 50 per cent., from 1851 to 1861; that the visitors last season numbered 300,000; that the engineer, Mr. T. Page, C.E., is the most eminent member of his profession; and that the consulting manager, Mr. W. Northhouse, has the prestige of success from the many great companies he has organised, there can be but little doubt that the shares in this will be eagerly sought for.—*Mining Journal*.

ORMEAN BRIDGE, BELFAST.—The works at the Ormeau Bridge, Belfast, are being rapidly pushed forward; all the arches are keyed, and two of the centres struck. There are four segmental arches, each of 45 ft. span, and with nine feet rise; the abutments and piers being 22 ft. high. An embankment has been thrown up out of the old river bed, and encloses the entire site of the new bridge, and a large area besides, which is kept dry by a steam pump. The cutting and filling required to form the new approaches are also in a forward state, and when finished will be a great improvement on the old steep descent of one in 20, but now reduced to one in 60, the width being also increased from 30 to 50 ft., or 42 ft. between the parapets. The stone forming the abutments, piers, and sheeting of arches, is from the county Down quarries, within five miles of the structure; that used for the front arch stones (*voussoirs*) being from the county Tyrone. Messrs. Lanyon and Smyth are the engineers, and Messrs. Connor, McLaughlin, and Harvey, the contractors; and Mr. N. Berry the superintendent, on the part of the Board of Public Works.

THE EMPEROR NAPOLEON AND HIS FATHER'S TOMB.—Different circumstances had prevented the Emperor from visiting the tomb which he had commanded in the Church of Napoléon-Saint-Leu (Seine-et-Marne) for his father, the King of Holland, who had possessed an estate in the neighbourhood, and who was at his own desire interred in the church. Having learnt that M. Petitot, the artist charged with the execution of the statuary, had before his death, which took place recently, expressed regret that the Emperor had not, by personal inspection, satisfied himself as to whether the artist had justified the confidence placed in him, His Majesty, three mornings back, left Paris for Saint-Leu to visit the monument. Being pleased with the execution of the work, His Majesty granted a sum of 10,000*fr.* for

the decoration of the interior of the church, and left 1,000*l.* with the mayor to be applied to charitable purposes. His Majesty afterwards visited the remains of the chateau formerly inhabited by his father.

NEWBURY.—The new Corn Exchange here was opened on Thursday week. The cost of the building is £6,500. Mr. Dodd, of Reading, is the architect, and his design is in the Italian style, varied in front by pilasters and ante-pilasters of the Corinthian style. Nearly half the roof is covered with glass, and the interior is extremely light and graceful. The dimensions of the building are: 160 feet long, 50 feet wide, and 50 feet high. Mr. Fletcher, of Salisbury, was the principal contractor; the other contractors being Messrs. Wilder and Sons, of Reading; J. and H. Hopson and S. Biddis, of Newbury.

SYDNEY.—We find from the Australian papers that considerable progress is being made with the tower of the Sydney University, which was left unfinished at the time the first portion of the building was erected. The tower when completed will much resemble that of Eton College, having a clock face on each side, and four ornamental turrets with spires. On the University enclosure the new Roman Catholic College of St. John is being erected, and it is in an advanced state. A new wing to the Australian Museum at Sydney is also in process of erection. The walls are up to the window-sills at one end, and ready for the base course at the other. Considerable alterations and additions are being made to the School of Arts. The framework for the roof of the new portion is completed, and all will be finished by the end of June. Many other architectural and engineering works are in progress in various parts of the colony; but further reference to them must be reserved for the present.

METROPOLITAN BOARD OF WORKS.—At the last meeting of this body, Mr. CARPMAEL, in the chair, Mr. BAZALGETTE, Engineer-in-Chief of the Board, reported as follows, respecting the progress and cost of the Main Drainage Works:—"This being the month for the preparation of the report on the works executed by the Board during the past year, it may not be considered necessary now to enter into details of the works constructed in the last month so fully as is usual on ordinary occasions. I, therefore, beg to state briefly that the works generally progress satisfactorily. The value of the work executed on the Northern Outfall Sewer is about £290,000; on the Middle Level Sewer it is £130,000; and on the Ranelagh Storm Overflow, from £28,000 to £29,000. The Southern Outfall Sewer is completed, and the value of the work done on the Southern High Level Sewer is £163,000. On Mr. Pearson's contract, work of the value of about £3,100 is finished, and of the value of about £78,000 on Messrs. Aird's contract for the Deptford Pumping Station."—The Committee under the Sale of Gas Acts submitted plans and specification for the Gas-Meter Testing House, in Wheeler Street, Spitalfields; and recommended that advertisements be issued, inviting tenders for the execution of the works. (Agreed to.)

ANCIENT GUESTEN HALL, WORCESTER.—Owing to the strong feeling evinced by the public for the preservation of these ruins, their destruction has been suspended, and not only so, but the tracery which belonged to the only perfect window, and which was first pulled down, has been rebuilt on the ruins of another. The question of its final demolition will be considered by the Dean and Chapter at their next meeting.

NEW BRIDGE OVER THE RIVER SEVERN.—At an influential meeting held on Friday afternoon, at Hampton's Load, near Bridgnorth, Mr. Heap, representative of Messrs. Harrison, of the Canada Works, Birkenhead, produced a plan of a wrought-iron lattice superstructure, the total length being 178 ft., or four spans of 40 ft., with a roadway of the width of 15 ft.; and a resolution was then proposed and carried that a Bridge Company should be formed, with a capital of £5,000, in 500 shares of £10 each, with a deposit of 10*s.* a share.

NEW TOWN HALL, PRESTON.—The invitation to the Prince of Wales to lay the foundation stone of the new Town Hall in Preston, during the celebration of the Guild, has been declined. In a letter from the Hon. C. B. Phipps to the Mayor, it is said that it is Her Majesty's wish that none of the Royal children should, during the present year, attend any public ceremony.

THE VICTORIA DRINKING FOUNTAIN.—The beautiful fountain erected for public use in the second enclosure of Victoria Park, at an expense of several thousand pounds, by Miss Burdett Coutts, is now completed. It is an octagonal temple, with a diameter at the base of 40 feet 9 inches, constructed of Portland and Kentish ragstone. The eight flights of steps which lead to the drinking basins are of Gazeley stone from Yorkshire; the eight piers and the shafts are of red Peterhead, and the bases and pedestals of gray Aberdeen granite, highly polished. These support beautifully-wrought arches, which again bear the cupola, the ashlar moulded work and carving being of Aubigny stone from Normandy. A four-faced clock is placed in the cupola, which terminates in a vase representing the figure of a mermaid. A door is placed in the shaft of the fountain, facing the north; above it is carved the coat of arms of Miss Burdett Coutts, over which again are two inscriptions, one the title of the fountain—namely, "The Victoria Fountain," the other containing the words "The earth is the Lord's, and all that therein is." There are four niches, in which are placed figures of Cupids (carved in Sicilian marble) on dolphins, and bearing pitchers, from which the water flows into the basins, which are of polished Aberdeen granite. These are supplied with cups bearing the following words:—"Temperance is a bridle of gold." The panels round the fountain are of Emperor's red marble from Portugal, and gray Connemara

marble. There are also monograms of the name of the giver, and coloured marble ribands. Round the fountain runs this inscription—"Given, Anno Domini 1862, by Angela Georgina Burdett Coutts," and "For the love of God and country." The total height of the fountain is 58 ft. 7½ in. The ground round the erection is tastefully laid out in parterres, with vases of terra-cotta from Grantham. The architect is Mr. Darbishire, and the builders Messrs. Smith, of Pimlico.

THE FOUNTAINS IN TRAFALGAR SQUARE.—The *Observer* says:—"The water is supplied to the fountains from the water-works in Orange Street, which were constructed by Messrs. Easton and Amos, in 1844, and is pumped up into a tank about 40 feet above the pavement of the square, from whence it flows to the two fountains, and the waste or overflow is conveyed back to a catch well, sunk underneath the engine. It is then pumped, by means of an Appold centrifugal pump, into the tank, and then passes over and over again. In its passage it is made use of to supply the condenser of the large 60-horse pumping-engine, so that not only does the water for supplying the fountains cost nothing, but it is actually made the means of economising fuel, by enabling the adoption of a condensing instead of a high-pressure engine, for the purpose of pumping the water from the artesian wells, for the supply of the different public offices. The quantity of water which was used in the fountains before the present alteration was from 400 to 500 gallons per minute; the Appold pump is arranged to lift from 1,200 to 1,400 gallons per minute—thus affording sufficient for the increased number of jets. The wells from which the supply of water is in the first instance derived are two in number: one, at the back of the National Gallery, is 300 feet in depth, and the second, in the enclosure immediately in front of the National Gallery, is 383 feet in depth. A tunnel, about 6 feet in diameter, and 400 feet long, connects the two wells. The water, although obtained from an artesian well, does not rise to the surface, and an engine, of about 60-horse power, is required to raise the water from about 90 feet below the surface. The steam-engine has two cylinders, the larger being 35 inches in diameter, with a length of stroke of 6 feet; and the smaller one, 22 inches in diameter, with a length of stroke of 4 feet. It works one double-acting pump, 13½ inches in diameter, with a length of stroke of 3 feet, for the supply to the fountains, and two 18-inch pumps, with a length of stroke of 20½ inches, for raising water from the springs into the tanks above the building. At an average speed of 16 strokes per minute, the fountain pump throws about 660 gallons, and the two spring pumps together 600 gallons per minute. In 1852 the tank tower was raised 20 feet, for the purpose of giving a better supply, at high service, to the upper tanks, in the river front of the Houses of Parliament. The pumping of 600 gallons per minute, equal to 432,000 gallons in 12 hours, lowers the water between 20 and 24 feet; it then remains stationary, as long as the engine is kept working. The height to which the water will stand, when at a state of rest, varies in wet and dry seasons; but the head does not appear to be gradually lowering. The cost of the works, as completed in 1844, was £8,392; the annual working expense is £492; but the water supplied to the various public offices, at the rates previously paid, amounts to £904 a year. The Houses of Parliament, the Admiralty, the offices in Downing Street, and twenty-eight public offices in all, are supplied from this source. Up to the present time, the fountains in Trafalgar Square have consisted only of a single jet, falling over from an upper and lower basin. This will still remain, as the centre figure of the basins; but at each of the semicircular bays there is now a group of jets, consisting of a centre and 16 surrounding it. The jet of water from the centre rises about 5 feet, and those in the outside 4 feet. There are, therefore, in the first instance, 68 jets, throwing 300 gallons per minute, rising from the surface of the basin. The ground plan of the basins is a square, the sides of which are about 68 feet long, and semicircular bays project from each of these sides. In the latter, as we have stated, are the circular group of jets. An outline of an octagon is formed within the square; and at each of the angles is a jet, which throws the water inwards, to a height of 20 feet, and into the upper basin of the central fountain. These eight jets throw 200 gallons per minute, and their curve is about 30 feet in length. There are, again, two inferior squares, surrounding the central group, and from each of these angles a jet is thrown outwards, crossing those from the octagon, rising to the height of 25 feet, and curving about 17 feet. These throw altogether 200 gallons per minute. Beyond the sides of these smaller squares are 8 feather jets, which throw up 200 gallons per minute, each of the groups of jets forming a display resembling the Prince of Wales' feathers. The whole of these may be played at once or together, in not less than twenty-five different continuations or changes."

THE ETRUSCAN TOMBS.—The opening of the Musée Napoléon III. has afforded M. Noel Desvergers, a well-known antiquary, an opportunity of discussing the merits of the precious objects therein contained, in an article published by the *Revue Contemporaine*. As M. Desvergers has himself been an active excavator, his description of the manner in which the Etruscans built their tombs presents particular interest. Our author states that, after pursuing his excavations for the space of seven years in the Tuscan territory, he at length reached the Pontifical frontier in the neighbourhood of Vulci, the necropolis of which had been ransacked by other archaeologists for upwards of thirty years, and filled the museums of Europe with innumerable treasures. It scarcely seemed likely, therefore, that anything more should remain worth taking on a soil which had already yielded so much. Nevertheless, M. François, an experienced explorer of tombs, was of a different opinion. Seeing that the sepulchres explored were all situated at a very insignificant depth, and not remarkable for

any great decorations, he concluded that lower down there must be much richer and larger tombs. After some researches he informed M. Desvergers that on the embankment of Fiora, at an altitude of 90 ft. above the river, he had bored the ground, and found an artificial grotto presenting none of the characteristics of a sepulchre, and which was therefore most probably intended to protect a more important crypt from the effects of infiltration. A shaft was therefore sunk to the depth of 36 ft. below the surface, when a subterranean passage was discovered 9 ft. in breadth, and at the entrance of which there stood a cippus, two sides of which displayed long Etruscan inscriptions. This passage, 99 ft. long, being cleared, the pioneers at length arrived at the door of the hypogeum. No trace of any previous visit was perceptible, and the tomb appeared to be one of some powerful lucumon, or chief, judging from the length of the passage, the importance of the cippus at the entrance, and the precautions taken for the preservation of the crypt. When the first gleam of light from their torches revealed the interior to mortal eyes for the first time after the lapse of twenty centuries they saw warriors clad in armour lying on their sarcophagi; the forms, the vestments, stuffs, and colours, remained visible for a few minutes, until the air from without, gradually penetrating into the crypt, effaced the whole. All that remained to the persevering explorers was the weapons, jewels, bones falling to dust, and a few threads of gold and silver which had been woven into their garments. The walls were, however, covered with paintings representing an episode of the *Iliad*, and of very superior execution, evidently pointing to the influence of Greek civilisation in Etruria. The crypt had eight entrances, all adorned with the peculiar Etruscan mouldings which Vitruvius calls *barycephala*, or top-heavy. The inscriptions were ascertained to be of a period anterior to that of the conquest of Etruria by the Romans. M. Desvergers therefore concludes that this tomb dated from the fourth century before our era. Some of the treasures of the Musée Napoleon III. belonged to this tomb.

WORKMEN'S HOUSES IN EDINBURGH.—The Metropolitan and Edinburgh Building Associations are each to build two rows of working-men's houses at the Dumbiedykes. Altogether, at this place, 200 houses will be erected, providing accommodation for nearly a thousand persons, young and old. It is the intention of the two associations to build comfortable and substantial houses, and to sell as many of them as possible to the working men themselves, so as to turn over their money quickly, and at once proceed to extend their operations.—*Review*.

STONE-PLANING MACHINE.—The *Dundee Courier and Argus* says:—"Hunter's stone-planing machine, which, we are told, shapes and dresses stones for building very effectively and cheaply, is growing into notice much more rapidly than it would have done if there had been no quarrel between the masons and their employers; and if the quarrel lasts much longer, the men may find that, to a great extent, their labour in one department has been superseded. We see, by an advertisement which has appeared in one of our columns, that a limited liability company, comprising some of the leading builders and quarrymen, has been established in Dundee for the purpose of buying and working one of these machines, and that a considerable profit is anticipated. We do not intend here to enter upon the vexed question as to how far the employment of machinery benefits or injures particular classes, or the whole community, but one thing, at all events, we may congratulate the masons on. We have heard a great deal lately of the unhealthiness of their occupation. The unhealthy part of it, we believe, is the dressing of the stone. If this machine answers the expectations which are formed of it, their work will be lessened, but what will remain will be less detrimental to life."

IMPERIAL HOTEL, GREAT MALVERN.—This hotel, the property of the Great Malvern Hotel Company, is now fast approaching completion, and will, it is believed, be ready for opening next month. It is built after the model of the Great Western Hotel at Paddington, and the style of the architecture is the Continental Gothic. The expense of the building, with its adjuncts of a bridge and covered way, will exceed £25,000. It is situated near to the Great Malvern Railway-station, on an eminence, and not far from the Barnard's Green Road. The architect is Mr. E. W. Elmslie. Mr. Thomas Perkins, builder, of Malvern, is the contractor, assisted by his nephew, Mr. Edwards. The building is composed of red brick, with Bath stone and Forest stone dressings, the roof, which forms a prominent feature in the design, being covered with green and purple slates. The difference in colour of the materials, the blue Forest stone and the white Bath stone, gives to the exterior an appearance both novel and pleasing. There are two principal fronts, the west and south. The exterior is very handsomely decorated. The two most prominent features besides those already mentioned, are the tower, about which there is some clever carving, and a beautiful oriel window over the chief entrance, forming the terminal of the corridors on the upper floor. This window is considered to be one of the most magnificent of its kind in England.

THE WELLS, GREAT MALVERN.—The Roman Catholic chapel is fast approaching completion. The Wells church is about to undergo a thorough renovation and repewing, and a spire to be erected on the tower.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—A conversation of this Society, the fifth of the season, was held under the most brilliant auspices at the Mansion House, on Wednesday evening, when the entire suite of rooms was, through the kindness of the Lord Mayor, who is Vice-President of the Society, thrown open to the visitors. The Egyptian Hall and other rooms were decorated with flowers, evergreens, &c., and also with oil and water colour paintings, and groups of statuary, lent

for the occasion by amateurs and others. This *reunion* was very numerously attended, there being present about 1,200 ladies and gentlemen, of whom a large number were foreigners, attired in various costumes. Amongst the distinguished strangers present were the President and ex-President of Liberia and suite, and several Indian princes and princesses. The Lord Mayor in the course of the evening briefly addressed the visitors, tendering to them a hearty welcome to the Mansion House, and speaking highly of the Society for the Encouragement of the Fine Arts, which he believed would one day be acknowledged as one of the most important and valuable institutions in the country. A concert followed, in which the principal performers were Madlle. Titiens, Madame Liebhart, Madame Honore, Miss Van Noorden, Madame Gilbert, Signor Giraltoni, Herr Reichardt, M. Naudin, Mr. Santley, M. Ascher, Mr. Henry Distin, &c. The conductors were M. Benedict, Mr. Alfred Gilbert, Signor Randegger, and Herr Ganz.

THE UNDERGROUND RAILWAY.—Considerable efforts are being made by the contractors for the formation of the above line of railway, to have it completed at the time proposed; and during the last fortnight much progress has been made towards carrying that object into effect. All the stations are progressing in a most satisfactory manner, and they will be shortly finished. There is only one portion of the line, between Paddington and Copple Row, Clerkenwell, in an incomplete state, and this is in the Marylebone Road, at the top of Gloucester Place, where a station is being formed. From Copple Row to the City terminus, hundreds of men are employed in the necessary excavations for continuing the open cutting to the intended station adjoining the Field Lane Ragged Schools; and the double line of tramway is laid within a short distance of the Sessions House, to carry the earth excavated to King's Cross, which is done by a steam-engine. Owing to the long days, the navvies are at work from an early hour in the morning.

CHIPS.

AN immense factory is now building on an extensive site of land situated on the river bank at East Greenwich, for the company recently formed to build boats by machinery, on the plan of an American inventor.

The Halifax Town Council have determined to invite the Prince of Wales to open the magnificent Town Hall erecting in that borough. October next is the time named for the event.

Mr. J. W. Malcolm, M.P., has announced his intention of erecting two commodious schoolrooms on his estate at Frith Ville, near Boston, for the education of the children of the neighbourhood.

Amongst the curiosities lately added to the Tower is a tablet of granite, on which is fixed a brass plate, stating that "On this spot Ann Boleyn (mother of Queen Elizabeth) was beheaded in 1536."

Up to the end of March last £375,000 had been expended on the national defences. The estimated cost of works and land was about £7,000,000. General accounts leave an available balance of £316,000, which will only suffice to meet payment of works under contract up to about the end of August next.

The Ranby House estate, midway between Retford and Worksop, has been purchased for Lord Lincoln, eldest son of the Duke of Newcastle, for, it is said, the sum of £55,000. The estate is well timbered, and is of great extent.

A statue to the late Joseph Sturge was unveiled on Wednesday at Birmingham, on which occasion Mr. Bright addressed those present.

Mr. Gould's tender of £545 for the erection of the new Ragged Schools at Gravesend has been accepted by the Committee.

Mr. R. Clarke's (architect, Nottingham) designs have been chosen for the square of buildings, consisting of Bank, first-class dwelling-houses, and shops, at Goole, Yorkshire. The working drawings are in progress, and will be shortly advertised for tenders for the works.

The Architectural Exhibition, 9 Conduit Street, Regent Street, and the collection of drawings and sketches of the late A. W. Pugin, will close on the 30th instant.

Mr. James Carnock, artist, who largely contributed to the establishment of the Fine Arts Academy, at Bristol, died on Friday, in his 49th year.

The oldest painter in Paris, Ingres, who is in his eighty-third year, has just finished a painting, "Christ among the Doctors of the Synagogue."

A prospectus has been issued of the Strand Hotel Company, with a capital of £100,000, in shares of £5. The site proposed is that of Lyon's Inn, comprising about half an acre.

Above £84,000 have been subscribed to a fund for building the memorial-hall in the metropolis, and erecting new chapels in the provinces, in celebration of the Bicentenary of Nonconformity. Some promoters of the movement are sanguine that even this sum will be doubled during the current year.

The new wing just added to the West of England Institution for the Deaf and Dumb was opened on Tuesday last. This wing has been built, at the cost of £1,025, by Messrs. Grant and Son, from designs by Mr. G. W. Cumming, architect.

On Thursday, June 5, the Ide National Schools were opened. The cost of the school-room and master's-house was about £750, exclusive of the site.

The Albert Memorial Committee met on Wednesday, at the Mansion House, under the presidency of the Right Hon. the Lord Mayor. The total amount received was announced to be £50,220.

On Monday last the foundation-stone was laid of the new District Church at Lendon, Widdiscombe. Mr. Rowell, of Newton Abbott, is the architect; and Mr. J. Chudleigh, of the same place, is the builder.

Captain the Hon. Windsor Clive and Mr. Botfield, the members for Ludlow, having ascertained that £500 still remained unpaid of the sum due for the late restoration of Ludlow Church, have, without solicitation, generously placed that amount at the disposal of the committee.

The Government, while declining to afford the Atlantic Telegraph Company any pecuniary assistance, have granted the use of ships for the purpose of making a more complete survey of the line between Ireland and Newfoundland. Soundings, it is stated, will be taken every mile, instead of at the wide intervals deemed sufficient when the project was originally started. Government ships will also be detailed to assist in the submersion of the cable.

The first annual meeting of the Edinburgh Coöperate Building Society was held on Tuesday last. The net profit on the Society's transactions since its commencement amounted to £112 17s. 9d., which gave a return of 13 per cent. on the paid-up capital for the year.

Sir T. G. Heskeith, Bart., M.P., has given a plot of land at Holmeswood, near Rufford, for the erection thereon of a Wesleyan chapel.

This evening Mr. Augustus Smith will call the attention of the House of Commons to the proceedings of the Westminster Improvement Commission, and ask the Chairman (Mr. Tite) what steps have been taken as to opening to view the south side of Westminster Abbey.

On Tuesday morning last the works commenced for the extension of the Government offices, and the erection of the new Foreign Office on the ground recently cleared of the houses between Downing Street and Charles Street, and St. James's Park and King Street, Westminster, and a number of workmen were engaged in laying the foundations. The demolition of her Majesty's State Paper Office, in St. James's Park, is now being proceeded with to make way for the new buildings.

Two fine colossal statues of Lord Chancellor Eldon and Lord Stowell have recently been placed in a very handsome library, erected for the purpose of receiving them, in University College, of which Society both these illustrious brothers were formerly Fellows. They are sitting figures on one pedestal, about seven feet six inches in height, executed in the finest Carrara marble.

The anniversary meeting of the Ecclesiological Society is to be held in the Lecture Theatre of the South Kensington Museum on Tuesday, July 1, and a discussion invited on the ecclesiological aspects of the International Exhibition, and of the Exhibition of Objects of Fine Art on loan in the South Kensington Museum. It is proposed that the meeting should be preceded by a visit to the latter, and by a club dinner in the refreshment department of the International Exhibition.

TENDERS.

MALTING, BEDFORD.—For the erection of a 100-gr. malting, containing a ground-floor, and three upper floors, with malt and barley chambers, and offices complete, for Bingham Newland, Esq., Bedford. Mr. John Day, architect.

Conquest (Kempston)	£2,997 8 8	Win. Smith	£2,566 0 0
Houghton	2,754 0 0	Freshwater (accepted)	2,499 0 0
Reynolds and Son	2,580 0 0	Bryant (too late)	2,495 0 0

CHICHESTER CATHEDRAL.—For the completion of the tower and spire of Chichester Cathedral.

Messrs. Beanland, Bradford, Yorkshire	£37,846 0 0	Bushby, Littlehampton	£44,890 0 0
Rudland and Thompson, Peterborough	39,661 0 0	Smith and Co., London	48,657 0 0
The lowest tender was accepted.		Fabian, Brighton	51,688 0 0

ESSEX.—For certain alterations to Warren-wood House, Woodford, Essex, for K. Mackenzie, Esq. Mr. J. H. Rowley, architect, 17 St. Helen's Place, City.

Salmon	£2,166 0 0	Bunow (accepted)	£122 5 0
Davey	142 0 0		

CHURCH RESTORATION, LINCOLN.—Tenders for restoring Washington Church, Lincoln. Mr. Goddard, architect.

Young	£650 0 0	Huddleston (accepted)	£598 0 0
Reeve	649 0 0	Smith	455 0 0
Ward	610 0 0		

CHAPEL, PENDLETON.—New chapel at Pendleton, Manchester, for the Methodist New Connection. Mr. Robert Scrivener, architect. Quantities supplied.

Neil	£2,862 0 0	Statham and Son	£2,257 0 0
Farrell	2,414 0 0	Metcalf and Waterson	2,037 0 0
Penk	2,398 0 0		

COTTAGES, POTTERIES ESTATE, PLUMSTEAD, KENT.—For building and completely finishing two semi-detached cottages, Eglington Road, "Potteries Estate," Plumstead, for Mr. Phillip Thomas. Mr. William Gosling, architect.

Lidbetter	£625 0 0	Greenwood	£610 0 0
Sonnet	615 0 0	Smith	565 0 0

HOUSES, PECKHAM.—For finishing four houses in the Montpelier Road, Peckham, for Messrs. Hart and Lovering. F. G. Widdows, architect.

Greenwood	£450 0 0	When	£347 0 0
Prott	390 0 0	Jeffer	343 0 0

VILLAS, TOLLINGTON PARK.—For erecting a pair of semi-detached villas, Tollington Park, Horney Road, for Messrs. Seales and Young. F. G. Widdows, architect.

Heath	£366 0 0	Emor	£346 0 0
Eaton and Goodwin	2490 0 0	Greenwood	2273 0 0
Flint	2420 0 0	James and Ashton	1943 0 0
Carter	2360 0 0	When	1857 0 0

NORWICH.—For erecting new parsonage house at Thorpe Hamlet. T. D. Barry, Esq., architect and city surveyor, prepared plans and supplied quantities, &c.

Brooks	£1972 18 8	Lacey	£1223 0 0
Foyson	1247 0 0	Worman	1218 0 0
Brown and Bailey	1238 0 0	Balls and Ling	1198 0 0

RECTORY HOUSE, CHALVINGTON.—For a new rectory house at Chalvington, Sussex, for the Rev. Trayton Fuller. Mr. James G. Smith, architect. Quantities supplied.

Palmer	£1,247 9 0	Constable	£1,090 0 0
Davey	1,159 0 0	H. and C. Bond	994 0 0
Donnelly	1,080 0 0	Wardle and Baker	970 0 0
Jones	1,037 0 0		

SHIP FRONT.—For putting in new shop front, and doing sundry repairs at 79 Westbourne Street, for Mr. William Fitch. Mr. Henry McCalla, architect.

London Building Company	£240 0 0	Beal and Boot	£61 0 0
Minty	196 0 0	Percy	165 0 0
Munro	173 0 0	C. and W. Fortescue	141 0 0

ROADS, TERRACES, AND SLOPES.—For laying out grounds, forming roads, terraces, and slopes, and drainage connected with the same. Erecting a porter's lodge, and laying the corridors, &c., with tile-pavement, at the Jews' Hospital, Lower Norwood, Surrey. Messrs. Tillott and Chamberlain, architects.

Mr. Willis	£1,169 0 0	Mr. Rogers	£1,111 10 0
Mr. Colson	1,134 8 0	Mr. Winn (accepted)	650 0 0

For Porter's Lodge.

Messrs. Piper and Wheeler	£377 0 0	Mr. Cannon	£325 0 0
Mr. Fish	375 0 0	Mr. Wells (accepted)	323 0 0
Messrs. Ashby and Sons	364 0 0		

For tile paving to corridors, &c.

Messrs. F. and G. Risher	£204 12 0	Messrs. Cannon (accepted)	£125 0 0
Messrs. McColla	168 15 0		

CHURCH.—For alterations to the English Presbyterian Church, Shrubland Road, Dalston. Messrs. Tillott and Chamberlain, architects.

Mr. Prince	£218 0 0	Mr. Fish	£230 0 0
Mr. Cannon	310 0 0	Mr. Wells	219 0 0

COMPETITIONS AND CONTRACTS OPEN.

DECORATION.—For the Decoration of the Exchange Hall, Stamford. Tenders to be delivered on or before Friday, the 30th of June, to Mr. Edward Browning, architect, Stamford.

ENGINE HOUSES.—For the construction of engine-houses, a boiler-house, chimney, filth-hoists, coal-sheds, dwelling-houses, wharf wall, sewers, and other works, in connection therewith, at Crossness, in the parish of Erith, Kent. Parties desiring to submit tenders may, upon payment of £21, obtain plans, sections, specifications, form of tender, and other particulars, on application to Mr. J. W. Bazalgette, Engineer of the Board, at the office, Spring Gardens, between the hours of 9 a.m. and 4 p.m., or on Saturdays between the hours of 9 a.m. and 2 p.m., until Thursday, the 3rd of July next. Half the amount will be refunded to such of the unsuccessful parties who return the drawings within one week after the day appointed for opening the tenders. The tenders are to be addressed to the Clerk of the Board, and must be delivered at his office before 4 o'clock on Thursday, the 3rd day of July next, and no tender will be received after that hour. The parties tendering must be in attendance at the Board at 12 o'clock on the day appointed for opening tenders.

CHAPEL, SCHOOLS, &c.—For the erection of a new Wesleyan Chapel, schools, &c., at Cad-oxton, near Cardiff, particulars of which may be had on application to the architects, Messrs. W. G. Habershon and Pite, 38 Bloomsbury Square, London, W.C.; Park Square, Newport, and Belvidere, Tredegarville, Cardiff.

SCHOOLS.—For the erection of school buildings, at Sutton-le-Marsh, near Alford. Plans and specifications may be seen at the house of Mr. R. Brookes, jun., Sutton, and tenders to be received on or before Saturday, the 20th of June.

PAINTING.—Tenders are required by the Burial Board of St. Mary, Newington, Surrey, for painting the whole of the iron railings of the parish churchyard, at Newington Butts. Specifications and forms of tender may be had on application to Mr. Joseph Burgess, Clerk to the Board, 1 Keene's Row, Walworth, S.

GASWORKS.—Tenders are required by the Yorktown and Blackwater Gas Company, limited, for the erection of their works, and laying about two miles of main. Plans and specifications to be seen on application to Mr. Withers, sen., Yorktown, Blackwater, Hants, or to Mr. Harris, engineer, Great Central Gas Works, Bow Common, London. Tenders, endorsed "Tenders for Gas Works," to be sent to Mr. Withers, sen., on or before the 21st of June.

GATES AND BOUNDARY WALL.—Tenders are required for back entrance gates and boundary wall, to ground in rear of the Staff College, Sandhurst, Berks. Parties desiring to tender must leave their names at the Royal Engineer Office, Sandhurst, on or before the 29th day of June, and pay the sum of 10s. 6d. for the bills of quantities, which will be forwarded to each party as soon as prepared by the Government Surveyor.

PUBLIC HALL.—Plans, elevations, sections, specifications, and estimates are required for the erection of a public hall at Tunbridge Wells, with reading, waiting, committee, and refreshment rooms, cookery, cellarage, &c., on land with 150 ft. frontage to a public road, and 300 ft. in depth. The hall to seat 800 persons, and the cost of the whole not to exceed £26,000. £25 will be given for the set of plans, &c., adopted, provided the architect is not employed; and £5 for the next approved set. Information, and a tracing of site may be obtained of the Secretary, Mr. John Colbran, Royal Library, High Street, Tunbridge Wells, to whom plans, &c., must be sent, not later than the 20th of July next.

SCHOOL HOUSE, RESIDENCE, &c.—Designs, plans, specifications, and estimates are required for the execution of a new school-room and residence for the master, upon a piece of ground situated in Woodbridge, Suffolk, adjoining other land, the property of the Seckford Charity. A photograph view of the site, together with a plan of the ground, and printed instructions and particulars, for the guidance of competitors, will be forwarded on application to Mr. J. H. Wood, the Clerk to the Trustees, at his office, Church Street, Woodbridge, on or before the 1st day of July next. £20 will be given for the best design, £10 for the second best; such designs to become the property of the Trustees. The sum to be expended is not to exceed £2,500.

COAST-GUARD STATION.—For the erection of a coast-guard station at Felpham, near Bognor, Sussex. Drawings and specifications may be seen at the coast-guard watch-room, Bognor, or at the Admiralty Coast-guard office, 12 Spring Gardens, London, S.W., where tenders are to be sent directed to the Commandore General of Coast-guard, and endorsed "Tender for Felpham station," not later than noon of the 23rd inst.

SEWERS.—For constructing four sewers. Plans, sections, and specifications may be seen, and printed forms of tender and further information obtained by applying to Mr. R. E. Rowe, Town Surveyor's Office, 10 Emmanuel Street, Cambridge. Tenders to be delivered by Monday, June 16.

SEWERS.—Tenders are required by the Board of Works for the Fulham district, in the County of Middlesex, for the laying down, constructing, and completely finishing a brick sewer, of about 1.1 ft. in length, and other works connected therewith, in the New Road, Hammersmith. Plans, specification, and detail drawings of the works, together with the form of tender, may, with other particulars, be obtained at Broadway House, Hammersmith, between the hours of 10 a.m. and 4 p.m., on any day previous to June 18. Sealed tenders are to be delivered on or before that date, addressed to the Chairman of the Board, at their office, Broadway House.

BARRACKS.—For the erection of west wing of soldiers' barracks, and soldiers' quarters, Fleetwood. Parties desiring to tender for the erection of these works must leave their names at the Royal Engineer Office, 225 Stretford Road, Manchester, on or before the 16th inst., and pay the sum of 10s. 6d. for the bills of quantities, which will be forwarded to each party as soon as prepared by the Government Surveyor.

CHURCH IMPROVEMENTS.—The execution of improvements on the Free Church, Virginhall, N.B. wanted from joiners, painters, and plasterers. Specifications are in the hands of the subscriber, who will give all necessary information, and receive offers up to Wednesday the 18th current.

ROADS.—For maintaining and keeping in repair, during the term of four years, commencing from the 15th May last, the roadways of the following County bridges, viz.:—Stone Bridge, Langley Bridge, Brancepeth Bridge, Crook Bridge, Eel's Beck Bridge, Bradley Bridge, Nicky Nack Bridge, Gibbon's Bridge, and Spennymoor Bridge. Further information may be had on application to W. Crozier, Esq., C.E., Bridge Surveyor, at his office in the County Courts, Durham, to whom tenders sealed and endorsed "Bridge Tender," are requested to be sent, or delivered, on or before Friday June 20.

ROADS.—For making, widening, and repairing the line of road from Bannan to New-Galloway, in the parish of Kells, viz.:—1. For making about 100 rods of new road. 2. For widening and repairing about 100 rods of the present road, and 3. For widening and repairing from 500 to 300 rods of the present road towards the south end of Loch Ken. All conform to plan and specifications, to be seen in the hands of Thomas Blackley, Road Surveyor in Castle-Douglas, up to Monday, the 23rd inst., at noon, with whom, before which date, tenders must be lodged.

ABRIDGED SPECIFICATIONS OF PATENTS FOR INVENTIONS.

From the "MECHANICS" MAGAZINE, June 6.

2843. J. H. JOHNSON. Improvements in the construction of steam or other vapour and water or other liquid tight joint. (A communication.) Dated Nov. 12, 1861. The liquid tight joint is produced by the combination of an open or split packing ring of copper, or other suitable metal, with a V or angular circular groove formed on one or both junction surfaces, or with angular or bevelled surfaces, on one or both faces of the joint, in such manner that the ring, which is open or in a slightly expanded state, when placed in or upon one of the angular surfaces or grooves, shall be closed, and forced into its proper place by the act of compressing the two parts of the joints together. *Patent completed.*

2851. E. C. KEMP. Improvements in gas-lamps, glasses, and other fittings. Dated Nov. 13, 1861. This relates to gas lamps, their glasses and tops, and consists, 1, in constructing the framework, or parts that retain the glass, of a hall lamp so that a single nut and screw at the top of each pillar or upright bar thereof serves to unite the upper frame, and the radial arms by which the lamp is supported and suspended from the centre; also in supporting them by a hook and eye from the gas-pipe in such way that the lamp can be unhooked at pleasure without interfering with the gas-duct. The invention also relates to gas and other lamps and their glasses and shades, and to the method of applying them to the fittings. These glasses or shades are generally supported by a triangular piece from the bottom, which throws a disagreeable shadow downwards. According to this invention the patentee supports them from the upper part, and for this purpose he makes the glass somewhat in the form of an inverted parabola or bell shape, with the large end uppermost; this is formed with a lip, which is inserted within a ring fixed horizontally at the termination, and on a level with the gas-arm of the lamp, or chandelier, or other fitting. The glass rests on two lugs within the ring, and is inserted from below, and fixed by a screw opposed to the two lugs. The gas is conducted by a small pipe from the arm, and descends within the parabolic shade to a suitable point; an opening is made in the bottom of the shade for the admission of air. He further applies a top or cover which harmonises with the contour, and completes the above form and arrangement of the shade. *Patent completed.*

2853. L. ROLLAND. An improved spring-door shutter, with a movable lever. Dated Nov. 13, 1861. This invention consists in setting a stiff metallic wire along the frame of doors, a little behind and parallel to the line of hinges, and extending about the whole height of the said doors; the upper end of the wire is punched in a little socket fixed to the frame, while the lower end, running freely in another guiding socket, is pinched below by a small cap carrying a hinged lever, which lever can be brought at pleasure in a horizontal or vertical position, in the first case, bearing against the door, it shuts by the spring action of the wire; in the second case, standing up against the frame, it has no action on the door, which can remain open or shut by hand. *Patent abandoned.*

2859. F. CONEY. An improved stock for brooms. Dated Nov. 13, 1861. The object of this invention is to obtain the equivalent of two separate brooms upon one stick or handle, and the invention consists in forming the stock with a head and two sides as hereafter explained. A hole is made in the stock for the reception of the stick or handle; the two sides are continued down at angles, approach or meet at the bottom of the broom, and carry bass, hair, or other fibre; one side may be filled with bass, and the other with hair, or they may both be filled with similar or different materials suitable for brooms. *Patent completed.*

2864. J. LESLIE. Improvements in the manufacture of gas. Dated Nov. 13, 1861. Here, in order to manufacture gas more advantageously from hydro-carbon fluids, the hydro-carbon fluid is caused to flow or drop down a tube or series of tubes, by preference in an upright position, within an outer vessel or retort, which is heated externally. *Patent abandoned.*

2865. H. R. FAICKER and J. MANLEY. Improvements in apparatus for facilitating the cleansing of sewers and other water-courses or ways. Dated Nov. 13, 1861. This consists of a bar or axis of wood or iron, having thereon numerous tines, or blades, or stivers, which are fixed round the circumference of the bar or axis in such a position as to stand in the place of the thread of a screw, the bar forming the centre or shaft of such screw; thus placed, tines, or blades, or stivers are actually detached portions of the thread of the screw. The two ends of the shaft or axis are furnished with swivels, and by the act of drawing or moving the shaft or axis longitudinally through water or mud, such shaft or axis will revolve or rotate together with the tines, or blades, or stivers thereon, so as to agitate the mud and matters which are below the water, and beat up and internally mix such mud and matters as are in the sewers, rivers, &c. *Patent completed.*

2866. A. C. LIPSETT. Improvements in apparatus for heating or boiling fluids for domestic or other purposes. Dated Nov. 14, 1861. Here the inventor uses a vessel of any desired dimensions, and formed of a conical shape, tapering smaller towards the bottom, at which part it is provided with a watertight aperture employed for fitting the vessel upon a tube fixed to a circular concave saucer or plate, so that the bottom of the vessel does not touch the saucer, but allows it, as well as the conical surface of the vessel, to be exposed to the flame arising from the ignition of methylated spirits of wine, or other suitable spirit placed in the saucer. *Patent abandoned.*

2869. M. WIGZELL. Improvements in machinery or apparatus to be used in moulding and casting twisted nails, bolts, and screws, for sheathing vessels, shipbuilding, and other purposes. Dated Nov. 14, 1861. This consists of a plate or plates fitted with any number of nuts, through which screws of the required pitch work; on the ends of the said screws are attached the screws or twisted form of nails forming the patterns of the articles to be made, which patterns, by being made to descend, screw themselves into the sand or other material used instead of sand, and produce the required form or mould. The plate or frame containing the screws is made to rise or fall by a screw or lever, by hand or any known motive power; and this plate or frame, when raised, carries with it the screws and patterns of the nails or other articles to be made, and causes them to twist or unscrew themselves out of the mould, the nuts through which the screws work being fixed and arranged on a suitable framework or stand. *Patent completed.*

2872. G. HAWKLEY. Improvements in apparatus for sounding alarms and actuating ventilators. Dated Nov. 14, 1861. This consists in means for sounding alarms and actuating ventilators when the temperature of an apartment is increased beyond that at which the apparatus is set to go. This object is effected by means of strips of metal (by preference zinc) which will expand freely by heat, in combination with certain levers. *Patent abandoned.*

2874. C. H. MUEHLEN. Improvements in ventilators for railway and other carriages and for other similar purposes. Dated Nov. 16, 1861. This invention is carried as follows:—At the top of the aperture, for the window sash, and behind the grooves in which the sash slides, the inventor places one or more strips of wire or silk gauze, joined together, so that they can be folded or opened out, the top strip being held by pivots working in bearings fixed to the frame. The bottom strip of gauze is mounted with a bevelled strip of wood or other material, to which the top of the sash is made to correspond, and the strips are made to unfold or expand by weights on pulleys. There are details, which we cannot here give space to. *Patent abandoned.*

2877. E. LOMES. Improved machinery for moulding bricks, tiles, and other like articles. Dated Nov. 15, 1861. This consists in adapting to the lower end of the pugmill shaft, one, two, or more eccentrics, cams, wipers, &c., in combination with moveable stops, against which the clay or substance to be moulded is pressed by the cams or wipers as they move round. By that means the clay is squeezed between the curved surfaces of the wipers and the stops, and will thereby be forced out of the mill through the apertures provided for the purpose, and will be pressed into or through moulds or dies. *Patent completed.*

2888. J. ELSE and T. GONFREY. An improved washing apparatus. Dated Nov. 16, 1861. This consists of an oblong frame of wood, or other suitable material, the bottom whereof is open, and the lower ends of the sides of the frame are either straight, or are inclined inwards, the inclination being such that the frame will be firmly on the bottom and sides of a puncheon, or washing-tub, or vessel. On the sides of the frame, inside thereof, are two grooves which receive the edge of a sheet of zinc, or other suitable metal, which is corrugated in the direction of its width, having corrugations either of a uniform character or varying in their width or depth. The corrugated sheet is somewhat raised in the centre, and lies on a strip of wood or other material which is placed centrally between the sides of the frame, and stands a little higher than the slots in the sides of the frame; the ends of the strip rest upon the pieces of wood or other material stretching from side to side of the frame. From a little below the top piece, and at a short distance from the back thereof, is a piece of wood or other material which extends to the top of the frame, and connects the top end and sides together, and also forms a surface for the water to run down when the apparatus is in use. *Patent completed.*

PROVISIONAL PROTECTIONS.

1001. H. A. Holden, Birmingham, merchant, and C. Weekes, Carmarthen, C.E. Improvements in apparatus used in drawing water or other fluids from cisterns, tanks, or other vessels. Dated April 8, 1862.

1110. J. H. Johnson, 47 Liocola's-inn-fields, gentleman. Improvements in machinery or apparatus for cutting the teeth of wheels, racks, or segments. (A communication.) Dated April 16, 1862.

1142. W. Muna, Borrowstounness, Linlithgow, N.B., engineer, and D. Ballantine, jun., ironfounder. Improvements in mills for grinding. Dated April 19, 1862.

1163. A. Dixon, Birmingham, engineer. Improvements in knife and fork cleaning machines. Dated April 21, 1862.

1187. A. V. Newton, 66 Chancery Lane, mechanical draftsman. Improvements in looms for manufacturing tufted pile fabrics, and in the mode of operating such looms. (A communication.) Dated April 23, 1862.

1211. P. R. Drummond, Perth. A revolving rake for lifting objects from the ground. Dated April 25, 1862.

1261. E. Moore, Tewkesbury. Improvements in the manufacture of dress skirts and dresses. Dated April 30, 1862.

PARTNERSHIPS DISSOLVED.

James Smyth Benet and Arthur Newson, Norwich, architects.

Jacob Marvel Robertshaw, and George Lax, Leeds, builders.

William Whitehorn, and Reuben Cook, brickmakers.

William Flanagan, Owen Morgan, and James Brown, Liverpool, joiners.

BANKRUPTS.

Joseph Johnson, Flora Villas, Albion Gardens, Hammersmith, plumber, June 24, at 12.

John Child, Weymouth Terrace, Hackney Road, builder, June 24, at 1.

William Shepherd, Berry Edge, Durham, joiner, June 30, at 12, Bankrupts' Court, Newcastle-upon-Tyne.

Thomas James, Sheen, Buckinghamshire, timber merchant, June 23, at 12, County Court, High Wycombe.

Henry Wick Clarke, Providence Row, Old Ford Road, Bow, carpenter, June 18, at 11½.

Joseph Julien Kadowski, Buckingham Place, Fitzroy Square, designer, June 17, at 3.

William Holmes Wakelin, Ealing, builder, June 17, at 3.

William Cook Bramwell, Blackburn, Lancashire, builder, June 20, at 12, Bankrupts' Court, Manchester.

Thomas Dovener, Burnley, Lancashire, stonemason, June 23, at 3, County Court, Burnley.

George John Merritt, Landport, Hants, stonemason, June 24, at 11, County Court, Portsmouth.

William Hyde, Weston-super-Mare, Somersetshire, carpenter, June 21, at 10, County Court, Bathbury.

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favour us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

Received.—C. and L. (too late), R. C., T. T., Chalk Lane, W. H. T., B. & C., Juvenile Architect, J. M. H., G. J. P., J. G. B., J. T., J. W., J. B., J. J. B., T. W. G., W. F., Quandom, P. G., W. H. R., T. R. S., M. O. T., R. S., B. W., H. L. J., J. H. B., J. C. (too late), W. H. D. (next week), J. P., J. W.
J. M. Hay.—The table of fees adopted by the Glasgow architects, is to be found in the BUILDING NEWS for March 8, 1861, p. 214, appended to a letter which bears the heading "Architects' Charges."

* * NOTICE.—The BUILDING NEWS is now published at 166 Fleet Street, where all Communications and Advertisements should be addressed.

THE REGULATION OF ARCHITECTURAL COMPETITIONS.

A PAMPHLET in the form of a letter, on the above subject, has reached us—printed for private circulation by Mr. John Honeyman, Junr., a member of the Glasgow Architectural Society. It seems that the subject of the regulation of architectural competitions has come before the members of that Society, and that they have determined to try a scheme similar to the one attempted by the Architectural Association a good many years ago—namely, the establishment of a code of regulations, by which competitions are to be governed in such a way as to secure fairness to all parties.

The very serious nature and extent of the evils attendant upon the present mode of conducting architectural competitions, have been too frequently acknowledged to admit of a moment's doubt. It is quite certain that to all engaged in them, to employers quite as much as to architects, any effectual plan for checking those evils would be of the greatest advantage, and there can be little doubt that improvement must and will come, so great is the desire felt for it among the members of the profession.

It will be necessary, before competitions can be established upon a basis at once satisfactory and permanent, to restrain competitors from certain questionable proceedings, at present frequently taken, and also to restrain those who invite architects to compete, from occasioning certain irregularities and omissions, which are equally frequent. All the schemes hitherto brought forward have been based upon this necessity; they have consisted of regulations, some intended to be binding on competitors, and others on those who invite competition; but they have overlooked the all-important question, "What power is competent to exercise the restraining influence admitted to be essential?"

It is the misfortune of almost all proposals hitherto made, to labour under the same difficulty as the celebrated scheme of the mice who proposed to "bell the cat;" the remedy would indeed be effectual, but no one is able to apply it.

As regards employers, it is quite clear that neither architects nor anyone else can, by any regulations, prevent public bodies or others from putting just what advertisements they please into the public papers, and offering what premiums they please, under whatever conditions they think proper.

This has been so obvious that the reformers of competitions have almost always admitted its truth; they have, however, concluded justly enough, that could they get the whole architectural profession to agree never to compete except upon certain terms, they should reduce the public to the necessity of accepting those terms as often as they thought it necessary to invite plans from competing architects.

To obtain the unanimous consent of so large, so scattered, and so irregularly constituted a body of men as the members of the architectural profession, to any set of rules, will be found far more difficult than has been supposed, and probably there is not a single point among those which will be uniformly admitted to stand in need of remedy, which all would propose to rectify in the same way.

Men also feel, that although they would gladly conform to any just regulations, to which all the members of the profession subscribe, they will not bind themselves to a code, however reasonable, to which only a few, or even to which only a majority of architects have given in their adhesion; for the effect of this would be, to shut themselves out from advantageous competitions, and to leave the way to success all the more open to less scrupulous rivals.

The particular scheme advocated in Mr. Honeyman's pamphlet is open to the same objection which lies against other proposals to establish a code of regulations, to a greater degree perhaps than they; and it seems not unlikely that, if accepted, its operation would be less satisfactory than that of other schemes. The idea is, that architects are to enter into an agreement, that so often as they compete for architectural work they will conduct their competition in a certain way; and further, that any competitor who has entered into this bond, and is found to have gained a competition in any other way, is to forfeit a considerable sum of money.

There is less likelihood of this proposition being generally agreed to than almost any other which has yet been brought forward; there is, further, the certainty that if it were established, while it might to a certain extent operate as a check, there would result from it litigation, heart-burning, and dissension to no common degree; and lastly, we cannot help feeling, that such a regulation generally agreed to would seem very much to stigmatise the architectural profession in the eyes of its own members and of the public.

We believe that all these methods, which partake of the nature of compulsion, will and must fail, and that the real remedy lies in the moral influence which the growth of a high tone of professional feeling and unanimity among architects will exercise, and in the use of such moral means as will make no pretension to compulsion, and will consequently not provoke resistance or distrust.

United action, and the sort of *esprit de corps* which will prevent a man's doing for his own benefit that which will damage the profession to which he belongs, is not a thing to spring up all at once, and the great stride which the architectural profession has made in a few years may well be supposed to have introduced elements which time and care will be required to consolidate. The process is going on, however, and we doubt not that the day is approaching when the general feeling of the body of architects will far more effectually hold back men of weak principles from disreputable modes of gaining practice, than any code of laws which can possibly be framed.

The Northern Architectural Association has set an example, in the direction of attempting to guide public bodies, which deserves consideration. Its members have agreed upon certain conditions, which they can recommend to committees and others as those which they conceive likely to ensure a fair competition; and whenever a competition is announced, the Secretary of the Association forwards a copy of this list of conditions to the conductors of it. In some cases they have been adopted; and we believe that were other architectural bodies to pursue a course thus moderate and dignified, they would be more likely to effect their object than by advocating or attempting to enforce more forcible measures. Many, we believe most, committees and public bodies, are sincerely desirous to do right; and when they sanction a job, do so because one or two of the most clever and least principled of their number have succeeded in carrying matters their own way; and a document of the nature of suggestions, coming from a source of undoubtedly good standing, and on the face of it fair and business-like, would be likely to command assent, and to be adopted without difficulty in many cases. At any rate, the proper way to go to work is to establish and exercise a moral influence; and we fear that the suggestion of the pamphlet before us, however well meant, has more of material than moral force in its nature.

ART AND MANUFACTURE.

WHEN any object of use or luxury is frequently demanded, the making of it begins to assume that regular and systematic form which we call manufacture. Articles that are seldom wanted, or which have some peculiarity of their own, are usually said to be made, while those which, like soldiers' uniforms, are made in large numbers, and of certain specified sizes, are said to be manufactured.

This broad distinction between making and manufacturing is one that we do well to bear in mind, because the application of art to handicraft is governed by two essentially different principles, according as the work to be done is or is not a piece of manufacture. In the one case the handicraftsman must be an artist, in the other it is the maker of the original pattern, and not the actual handicraftsman, in whom the feeling and skill of an artist are required. Let us, for instance, compare ornaments in wrought and cast iron. The workman engaged upon a piece of ornamental wrought iron work may or may not have originated the entire design. He may or may not work from a sketch, a drawing, a model, or even a completed piece of iron work. In any case, however, the character of the completed work depends not a little upon his artistic feeling and skill. If he have an original in the same metal before him, the degree in which he will catch its spirit and reproduce it depends entirely upon his skill and cunning.

With cast iron, however, the workman has a very subordinate part to play. A pattern is put into his hands, and all he does, or can do, is to take a very accurate impress of that pattern in sand, and then to pour molten metal very steadily into the mould. The pattern that came into his hands is the circumstance which influences the character of the ornament produced, and so long as he can mould neatly and pour steadily, any number of castings may be produced, each like the other and quite independent of the workman's possessing or wanting artistic sense and taste.

That the difference here pointed out obtains, between all articles manufactured in quantities, and all those made singly, will probably be admitted without hesitation. We admire the art of the carver when we examine a cornice carved in stone or wood; but when we admire an enriched plaster cornice, though we may praise the workmanship of the plasterer, we admire the *art* of the original modeller. The painter gives the impress of art to a picture, of which he with his own hand lays the colours on to the canvas; but in an engraving we owe the beauty and value of the work, not to the printer who spreads the ink on the plate and passes it through the press, but to the engraver, whose cunning cut into the plate those original lines.

Just as there is higher art in painting than in engraving, in sculpture than in plaster casts, in beaten work than in metal-work; so there always will and must be the highest excellence in those productions in which the same mind which originates guides the hand that executes. Though this be true, there is an absolute necessity for the adoption of the principle of manufacture in meeting the wants of a populous and civilised country. Hence it comes to pass, that in

executing works, even of an ornamental nature, we are obliged to be content with only seldom employing artistic handiwork, and to resort to rapid methods of manufacture.

This necessity being admitted, it remains that, while we should jealously guard against the infringements which manufacture is likely to make upon the legitimate domains of art, we should at the same time exert ourselves strenuously to ensure the assistance of the best art available for forming the patterns and originals of all manufactured goods. We have been of late sincerely desirous to extend the application of art manufactures, and have succeeded wonderfully well; we have also done a great deal within the last few years to improve the taste and skill of the designers of all sorts of ornamental articles and objects. It is, however, to be feared that we are by no means equally on our guard against the danger of allowing manufacture to usurp the place of handicraft, in even the highest departments of art; and it is principally with a desire to draw attention to this danger that the subject is now considered.

The ordinary architecture of the day (and architecture is generally the truest exponent of the state of popular taste) is one admitting of as wearisome a repetition of the same pattern time after time, as any which can occur in the manufacture of wall-papers, or table-cloths, nor is the state of Paris in this respect much better than that of English cities. In short, a vast majority of our buildings may be compared to the Latin and Greek verse produced by the hundred lines at public schools, constructed upon a definite form, supplied with metaphors, similes, and epithets, from a supply carefully classified and alphabetically arranged in the "Gradus ad Parnassum."

The very fact that symmetrical repetition of equal and similar features, is one of the main sources of effect in all the classical styles, and that the classical styles or corruptions of them have been, since the Reformation, the only ones generally popular in this country, has induced a strong inclination to promote the endless repetition of those small details where carving or other handiwork might have been happily introduced, to stamp an individual character upon a whole building, or portion of a building; and it is indeed fortunate that the Gothic revival has at last come, and drawn attention to the value of the opposite principle, that of endless variety and individual character, both in features and in buildings.

While good Gothic work will always command and require the labours of original artistic workmen, in many branches, we cannot but see that the manufacturer has been called in, not only to aid the architect by the production of simple, and necessarily manufactured articles, such as tiles, window quarries, or crests, but even to supplant the art-workman in portions of the building, which can ill afford to lose the characteristic touch which the individual workman alone can give.

There is nothing so truly living and artistic about a building, as the carving on its nooks and corners, its angles, pinnacles, and bosses; yet we have carving-works, where the work is performed wholesale by machinery, and if we do not also carve stone by a similar process, it arises more from the intractability of the material than from an indisposition to subject it to the steam-engine and the drill. But metal work illustrates, far more than any other work, the danger of allowing the wholesale manufacturer to invade the domains of the artist. Nothing affords finer scope for the display of original design, and of good artistic feeling in the workman, than the ornamental hinge fronts on the face of a Gothic door, and the beaten finials which mark the highest points of the roofs, or crown the summits of spirelets, dormers, or other small features: yet how seldom is the hand of an artist—an original worker—discernible in these features, particularly in the hinges! We get the pattern-book of one of the manufacturers of such articles, and having satisfied ourselves about the price, the discount, the extra charge for carriage and packing-cases, and the length of credit given, we order a pair of hinges, No. 25, or No. 50; and a ring, No. 12, and latch No. 2, just as if an ornamental feature on the level of the eye, and exhibited with every advantage of contrast, of colour, as well as proximity, were not as worthy of the best design and original handiwork as the bosses that stop the label which shelters the doorway, or the tender garland of spring flowers which twines and curls in the deep hollow running round it not twelve inches away!

It is of course true that, but for the artistic and inexpensive way in which such articles are now manufactured, they would be omitted altogether from very many economical buildings to which they form an agreeable ornament, at an almost nominal expense; but this is no excuse for adopting cast hinges and cast-iron finials in places where the funds exist for original work. Where the character of the work rises to that of pure art, the importance of avoiding manufactured ornaments, and replacing them with wrought ones, is very great.

Such a work as the Hereford screen at the International Exhibition, purely ornamental in intention, rich in design, lavish in decoration, and especially beautiful from the variety of its colouring, presents, in its smallest parts, an amount of repetition which would not have

occurred in a mediæval work of the same value. True, the middle age workmen would have wrought upon it for more years than the "Skidmore Art Manufactures Company" have done months; but it is thus only that a great piece of purely ornamental work ought to be produced, and thus alone that it can be rendered instinct with life and beauty, to the tip of every tendril and the heart of every feature and leaf, and thus alone that it can thoroughly merit the place of a work of the highest art.

We have chosen this illustration, because this repetition of minor features in a work of confessedly very high merit, coupled with the ominous title assumed by the well-known makers of the screen, and with the still more ominous praise showered upon those makers for the speed with which the work was done, argues unfavourably for the course in which we are going; and will even compare unfavourably with the best examples of renaissance work, where the temptation to abandon all attempts at individuality of workmanship is far stronger than it can possibly be in any work of Gothic character.

One thing must not be altogether passed over, and that is the possibility of adding nobility to almost any article of artistic manufacture by employing design in the use of it. For this purpose the articles themselves usually require to be simple, or they will not lend themselves well to the duty required of them; employed by an artist, the most simple coloured tiles, arranged in a good pattern, will surpass in merit the most elaborate manufactured pavement; the plainest glass quarries, well used, will outshine the most brilliant embossed window; and the simplest geometrical mosaic will give more real pleasure, and show more true art, than the most elaborate piece of machine carving untouched by the chisel of the workman.

For these purposes art-manufactures are good, but as a substitute for real original art they are bad; and plentiful, cheap, and specious as they are, it will require all our watchfulness, especially in this age of haste and inattention, to prevent their being adopted for uses which they cannot properly subserve, and exalted to positions which ought either to be occupied by something better, or honestly left vacant.

THE TRUTHFUL IN ART.

ON the 3rd of this month, Mr. Robert W. Edis read a paper before the Architectural Association, on "The Truthful in Art." This paper may be considered a fair sample of many others read before our architectural societies. It is a model of the forcible feeble style. Its writer appears to be lost in a fog, which is only occasionally lit up by scintillations of sunlight. Mr. Edis must certainly be the victim of some melancholy longing, which no language can express, and which no reality can satisfy. He, evidently, can only see as through a glass darkly. Everything wears to his eye a shadowy indistinctness. He sees in every direction men as trees walking. Where an ordinary person would behold a church tower, Mr. Edis would see pictured before him a kind of pillar, half fire and half cloud, which recedes into the dim distance when approached by mortal feet. He appears to be overwhelmed with the vast power of his own imagination. He takes the greatest possible liberty with nature and the English language. He tosses about phrases in fantastic confusion. He piles up a pyramid of epithets, and complacently examines it as a glorious work of art. He comes before the world as a preacher who does not understand his text. As a proof that we in no way misrepresent him, we will take as a sample a sentence or two from the introductory portion of his paper referred to. "To know," says Mr. Edis, "a truth well, we must fight it out; to gain that knowledge we must diligently strive to act up to those better principles and nobler thoughts which lie in the hearts of most men, and which, until the heavy cloak of indifference and carelessness in the first place, and falsehood and hypocrisy in the end, would ever appear openly, as the glorious sunlight of the heart words that lie within, guiding away right through the night of our own perversity and obdurate nature, which so long has obscured the truthfulness in us. Truth, then, is the great veil of Nature which God has spread over eternity; so Art lifts the veil which conceals the glory which once was, and shows forth all the beauty therein, bringing out all that is latent in fabric and jewels, stone, marble, and all else that is, and Truth combined with Art, must tend to lift man from the mere material and sensual in art, to the ethereal and highest nobility. And it should be our earnest purpose to strive to use well and properly that which learning and science has placed within our grasp; there must be throughout our striving an undercurrent of conscientiousness and truthful endeavour, a something which casts out all shame, all hypocrisy, and leads us to look at our noble art, not in the light only of making money, but as something to teach to future generations some little good, to write down in the pages of the present as we best can, and with the best of our ability, some few lines of the great art-poem, that has been ebbing and flowing from good to bad in past generations, and must still ebb and flow till all becomes as the

baseless fabric of a vision. Truth is a great virtue, in all art as in all else," &c.

If Mr. Edis or anyone else can see any rhyme or reason in this passage, he must possess more intelligence than falls to the ordinary race of mortals. The first sentence consists of a string of words put together with no definite meaning or purpose. We have vainly endeavoured to get at the idea with which the writer must have supposed he was inspired when he constructed the sentence. We are told something about "the better principles and nobler thoughts of the heart;" and something about "the heavy cloak of indifference and carelessness in the first place, and falsehood and hypocrisy in the end;" and of "the long night of our own perversity and obdurate nature," which have obscured the truthfulness in us. But what do all these fine words mean? Mr. Edis leads us into the dark and leaves us there. Would it not be better to have fewer splendid phrases and simpler ideas? When the author assumes the functions of the interpreter of Truth, he does not shine more conspicuously. He says, "Truth is the great veil of Nature," but we do not see why it should be so, any more than that Nature should be the veil of Truth. Then we are told that God has spread this great veil of truth over all eternity. A moment before it was the obduracy of our nature which obscured the truthfulness within us; now it is truth obscuring all eternity. Why truth can or should obscure all eternity we are not told. Having boldly advanced into the very *sanctum sanctorum* of the universe, Mr. Edis becomes more courageous, and proclaims the mission of Art. "Art," he says, "lifts the veil which conceals the glory that once was." According to this teaching, truth is a veil, and glory no longer exists, as it "once was," but this glory that "once was," still possesses "beauty." We should have thought that truth, instead of being a veil, was veiled by ignorance and prejudice, and that Art assisted to lift the veil so that men may see the beauty of truth.

Not satisfied with giving one memorable revelation in a sentence, Mr. Edis, without stopping to take breath, rushes on to inform us that Art, which lifts the veil of truth spread over all eternity, also brings out all that is latent in fabrics, jewels, stone, marble, and all that is concealed in eternity. Now, with our less imaginative minds, we should have thought that jewels, fabrics, stone, and marble had not been eternally concealed, and that they did not want Art to lift the veil of truth from all eternity to make them manifest. We should have thought that Art did something to produce jewels and fabrics. But what jewels and fabrics, stones and marbles, have to do with truth, nature, and eternity, Mr. Edis does not condescend to inform us. In the next branch of the sentence we are told that "Truth combined with Art must tend to lift," not a veil, but man. Truth at one moment was a thing to be lifted, the next moment it was an agent lifting man. After many long and laboured phrases, in which "the material," "the sensual," "the ethereal," "the highest nobility," "art," "science," "striving," "under current of conscientiousness," "truthful endeavour," "sham," and "hypocrisy," are huddled together in unutterable confusion, the writer indulges in another flight of imagination, and tells us "to write down in the pages of the present as we best may, and with the best of our ability, some few lines of the great art-poem that has been ebbing and flowing, from good to bad, through past generations," &c. First, Art is a poem towards which all are invited to contribute a few lines, as "they best may, and to the best of their ability;" then this poem, by a sudden transformation, is converted into an ebbing and flowing sea, which is not made to wash the shores of time, but to ebb through past generations. From the past, our imagination, in the twinkling of an eye, is transported to the future, when Art, Truth, veils, Nature, eternity, shams, hypocrisy, science, learning, the sensual, the ethereal, and "all becomes as the baseless fabric of a vision." The next sentence opens with another astonishing revelation. Truth, which was a veil over-spreading eternity, becomes, by a sudden movement of the enchanter's wand, "a great virtue in art." We might go on to show the other lofty flights of imagination which the writer has endeavoured to scale. But we will neither waste our own space, nor trespass on the patience of the reader by so doing. Mr. Edis reminds us of a little girl we once knew, whose mother was a French lady and whose father was a German. The little girl knew a little of French, a little of German, and a little of English, and sometimes when wishing to make herself understood, she would utter a sentence of mongrel English, French, and German, which nobody understood. The little girl, however, had a definite idea of her own, but clothed it in confused words. But Mr. Edis's ideas appear to be as foggy as his language is chaotic. Instead of studying the rules of Lindley Murray, Mr. Edis must have been sitting at the feet of Lord Dundreary. That noble gentleman never utters two consecutive sentences coherently. He is no sooner in the middle of a sentence than he loses his way, and like Mr. Edis, soon manages to get into confusion worse confounded. There is a difference, however, between Lord Dundreary and Mr. Edis. Though the one does not attempt to instruct his hearers, he

manages to amuse them, while the other neither interests nor amuses. When Mr. Edis gets into the depths of his subject, he flings about denunciatory epithets in the most unsparing manner. He speaks as if he were the only living high priest of Art. He pours contempt on the last five centuries of artistic effort. We have been told on high authority that "fools rush in where angels fear to tread," and we have living example before us. Mr. Edis comes before the public as a teacher of art architecture, without having studied the simplest rules of composition. He reads a paper which violates all the requirements of grammar. There is contradiction, confusion, and chaos in almost every sentence he utters. His paper is a shapeless mass of unintelligibility. And yet he comes before society as a denouncer of honoured names, as a deliverer from corruption and thralldom, and as the herald of a revolution in architecture. Before he undertook so important a mission, the very least thing he could have done was to have treated the English language with a little more respect. Before he undertook to take the beam from the eye of the public, he should have endeavoured to remove the mote from his own eye. We are now inclined to say, "Physician, heal thyself." Mr. Edis, and other aspiring teachers of architecture, should bear in mind that the art of composition deserves some consideration. The written language of a people is of as much importance as the architecture of a people. The teachers of the "Truthful in Art," should study with something like ordinary care the art of speaking and writing correctly and coherently, or we shall witness other examples of the blind leading the blind. We do not remember an instance of a man attacking so violently the customs of society as Mr. Edis has done in the paper we are now considering. Everything about him is denounced as sham, paste, plaster, hypocrisy, lying, and imposture. So slashing a critic and so fierce a declaimer should have come into court with cleaner hands. He must polish his periods and point his style if he is effectually to do the work he has undertaken. At all events, being so severe a critic himself, he cannot object to be severely criticised in return.

Literature.

THE MAUSOLEUM AT HALICARNASSUS RESTORED.*

IN the introduction to this admirable work, Mr. Fergusson very justly claims for the renovated Mausoleum of Halicarnassus the attention of all who take an interest in ancient, or who are engaged in the study or practice of modern architecture. All we actually knew of it till recently, was that the ancients were inclined to regard it as the very best specimen of architectural art which they possessed. Not only did they rank it as among the seven wonders of the world, but assigned to it that preeminence for the intrinsic beauty of its design, and the mode in which it was ornamented. Perhaps, before proceeding to speak of the volume in a critical sense, it may be well to enter into a brief account of the manner in which reliable materials have been gained for its production, and to render proper tribute to those who collected them. In 1846, Lord Stratford de Redcliffe obtained from the Porte a firman for the removal of certain bassi-relievi, which had been built into the walls of the castle of Budrum, the ancient Halicarnassus. These arrived in England in due course, and were at once admitted to be fragments of the sculpture of the mausoleum, as it had been previously assumed that they were. But their beauty only served further to increase the regret that all traces of the building to which they belonged should have been, as it thus appeared, for ever lost.

While things were in this unsatisfactory position, it was stated that Mr. Charles Newton, formerly an officer of the British Museum, and then Vice-Consul at Mytilene, had not only discovered the true site of the mausoleum on a spot previously indicated by Professor Donaldson, but had also found considerable remains of the long-lost building. Public attention, says Mr. Fergusson, was still further attracted to the subject, when it was presently announced that the British Government had fitted out an expedition to continue the explorations of Mr. Newton at Budrum and its vicinity. Everything seemed to shadow forth a most brilliant success, and from the high character which Mr. Newton bore as a Greek scholar, and a thoroughly educated archaeologist, all the Hellenist public rejoiced that an expedition fitted out on so liberal a scale, and for so desirable an object, had fallen into, what they believed to be, so competent hands. The first published results, continues Mr. Fergusson, were not encouraging. They took the form of papers presented to Parliament, and these were published as a Blue Book in 1858. A

* The Mausoleum at Halicarnassus Restored in Conformity with the recently discovered Remains. By James Fergusson, Fellow of the Royal Institute of British Architects, Author of the "Handbook of Architecture," &c. &c. London: John Murray, Albemarle Street, 1862.

second series of papers appeared in a similar manner in 1859. Diagrams illustrated the papers, and these are taken exception to by the author of the volume under notice. Finally, the labours of the expedition resolved themselves into the shape of a folio volume of plates, accompanied by a volume of text in octavo by Mr. Newton. These were published in February last, and obtained much appreciative attraction.

The author of the "Mausoleum of Halicarnassus Restored," is now by no means satisfied that Mr. Newton and his associates have arrived at just conclusions with regard to the nature and characteristics of the ancient Greek structure. He gives critical and analytical reasons for the lack of faith that is in him, and from the subjoined data, deduces materials for the elaborate drawings which ornament his book, and which he says are far nearer to the original designs than those of Mr. Newton. The bases upon which Mr. Fergusson proceeds to raise his superstructure are:—

First.—The passages in various ancient authors which describe the appearance of the building, or give its dimensions.

Secondly.—The actual remains of the building discovered in the recent explorations, and the measurement of the ground then obtained.

Thirdly.—The several tombs existing in Asia and Africa, evidently of the same type, and which afford valuable hints for the restoration.

Lastly.—The system of definite proportions in Greek architecture, which is not only most useful in suggesting forms, but also most valuable in rectifying deductions arrived at from other sources.

It must be admitted that the principles here laid down are clear and specific; but it will be for Mr. Newton and his friends to argue as to the conclusions at which Mr. Fergusson arrives.

We cannot undertake to solve so knotty a problem as that involved in the question of "Whose scheme of restoration is most near to the truth; Mr. Newton's, or Mr. Fergusson's?" Both gentlemen have evinced considerable ingenuity, and adduce strong evidence on behalf of their views.

In reference to the testimony afforded by ancient tombs as to the style of architecture of the Mausoleum, Mr. Fergusson introduces an illustration in the form of a structure which Mr. Newton discovered at Cnidus, and which he christened the Lion Tomb. That illustration we reproduce here, in order that our readers may observe the peculiar features of the ancient relic, and compare them with those of the Mausoleum of the rival restorers.

Whatever may be the impressions of those who venture upon the task of endeavouring to arrive at truthful deductions by following the leadership of the two gentlemen, as exemplified in their respective works, we can promise them an agreeable, though rather erudite task.

Perhaps, after all, the matter will have to remain in the company of speculative subjects for some time longer. Of the getting up of the work before us we must speak in high praise. We cannot quite agree however with Mr. Fergusson, when he states that it would be difficult to suggest any memorial which should more worthily commemorate the Prince whose loss the nation is still deploring, than a reproduction of "the monument which excited so much the admiration of the ancient world, and rendered the grief of Artemisia famous through all succeeding generations." We do not think either that the Memorial Commission will quite coincide with Mr. Fergusson on this point.

ISCA SILURUM.*

UNDER the above title has just been published a volume to which we have great pleasure in directing the attention of our readers. The particular district in which Caerleon is situated has long been celebrated for the discovery there of relics and remains of the Romans, and the talented author of "Isca Silurum" has previously published a volume entitled "Delineations of Roman Antiquities at Caerleon," with a supplementary pamphlet describing a Roman building. In fact, sufficient evidence has been adduced by the laborious researches of Mr. Lee, and other zealous antiquarians of Monmouthshire to prove, that for a long series of years the town of Caerleon was the residence of the Second Augustan Legion, which, from its protracted stay in Britain, obtained the name of Britannica. It also appears, from the terms in which the place is mentioned by writers of the Middle Ages, that it had been and was then, a town of considerable note. Caerleon appears to have had several names. In Gale's copy of the "Itinerary of Antoninus" it is termed *ISCE LEGVA AVGVSTA*—evidently, asserts Mr. Lee, a corruption of *Isca Legionis Secundae Augustae*. It was also called in the Ravenna list *Isca Augusta*, and *Isca Silurum*. Hence the first title of the work before us.

Although the author has, with much modesty, designated his beautifully illustrated volume a "Catalogue," it is really worthy a much higher appellation. It not only describes fully, and with singular erudition, the various objects of interest which enrich the Museum of Caerleon, but it contains essays by himself and others upon the various buildings and fortifications which were raised during the Roman occupation, and also many details in reference to the coins which have been found in considerable numbers in the neighbourhood of Caerleon. Into the question of the origin of the name of the town, which is discussed at some length and with much cogent and classical reasoning by the learned author, it is not necessary for us to go. The tracings of Roman buildings which Mr. Lee indicates, and the particulars of Roman remains which he gives, fall, however, legitimately within our sphere, and with those we shall endeavour to deal. The shape of the ancient fortress of Isca may at present be traced very distinctly, partly by the remains of the actual walls, and partly from an elevated ridge formed from their ruins. Like most other Roman encampments known to have existed in England and Wales, it appears to have been in the form of a square, with the angles rounded, and with an entrance near the middle of each side. That to the south-west led into a road now called the Broadway, and very probably to a ford over the river. It is to be regretted, that for many years before Mr. Lee and his coadjutors entered upon their interesting enquiries, the removal of stone from the ruined buildings, and their employment in the construction of modern edifices, had formed a remunerative occupation for the labourers of the district. The material advantages gained by the latter were undoubtedly at the expense of the scientific band who have subsequently occupied the field, and many antiquities which would have graced the Museum are thus for ever lost or destroyed.

Those portions of the walls of the fortress of Isca which still remain are of no great height—probably only from ten to twelve feet in the highest part from the ground outside. Many of the stone facings of the walls have disappeared in the way just described; and in these places the walls consist of a very irregular kind of masonry. The mortar, in general, is not mixed with pounded bricks, although this is the case near the corner of the wall, where strength was required. In the locality known as the Broadway, many valuable relics have been recovered, and those placed in the cases of the Museum are described and illustrated in the catalogue.

In 1855, the members of the Antiquarian Society, of which Mr. Lee is secretary, made some extensive excavations at Caerwent, and the results of these are described in the catalogue, by Octavius Morgan, Esq., M.P., and president of the Association. From this paper, which is accompanied by excellent lithographic engravings, we extract that portion relating to the Roman baths, which were then brought to light:—"Close adjoining the south-west corner of the wall, inclosing the tessellated pavement discovered in 1777, was a

* *Isca Silurum*; or an Illustrated Catalogue of the Museum of Antiquities at Caerleon. By John Edward Lee, F.S.A., F.G.S., Honorary Secretary of the Monmouthshire and Caerleon Antiquarian Association. London: Longman and Co., Paternoster Row.

rough heap or mound indicating the remains of former buildings. It was thought desirable to examine these, and excavation was commenced at the south side of the mound. A wall of very solid construction was discovered, and within this, at the depth of five feet, the men arrived at the door of a hypocaust. Some of the pillars, which were formed of sandstone, had been displaced, and among them there was a quantity of wood-ashes, with masses of slag. The excavation was proceeded with, and there was ultimately uncovered a small block of building, 31 ft. by 34 ft., exhibiting a complete set of Roman baths, perhaps the most perfect exemplification of a private suite of baths attached to a dwelling-house yet brought to light. Although it is not necessary here to go into the general question of Roman baths, it may be stated that the essential apartments of a Roman bath were:—the *frigidarium*, with the *piscina*, or cold water tank; the *apodyterium*, or dressing-room, which was slightly warmed; the *tepidarium*, a moderately heated chamber, where the processes of anointing, perfuming, shaving, and other such operations were performed; the *calidarium*, a strongly heated chamber, with a *calida piscina*, or hot-water bath; and lastly the *sudatorium*, raised to a high temperature with a dry heat."

All these arrangements were discovered at Caerwent, and it is clear, therefore, that the ancient conquerors of this island made themselves especially comfortable there, and introduced luxuries of which the natives had previously not even dreamt. The resemblance in some of their details of the Turkish baths which at present obtain in the metropolis to those of the ancient Romans is remarkable, and goes to demonstrate the truth of Solomon's words, "There is nothing new under the sun."

Mr. Morgan, in his elaborate and extremely interesting paper, describes very minutely the means and appurtenances with which the Roman baths were supplied, and has caused a model and plans to be made of the particular bath referred to. The model is deposited in the Museum at Caerleon, and the plans are copied on a reduced scale in the "Illustrated Catalogue." "One problem," says the writer, "remains unsolved, and that is where the Romans obtained water for the Caerwent baths." The brook is distant, and is dry in summer, and the village is now supplied from wells; and this we must conclude is the source whence it was procured by those who used the baths. To have carried the water by hand through the chambers would have been very inconvenient, and it is possible that there may have been some contrivance in the walls, now destroyed, for its introduction from the outside." Thomas Wakeman, Esq., contributes to the catalogue "Some Notes on the Early History of Caerleon," and in fact gives a chronological résumé of events connected with the ancient town, or city as it once was, from A.D. 892, when the Danes plundered it, down to the year 1236.

To the Rev. C. W. King has been entrusted the task of classifying the extraordinary number of coins which have been at various periods discovered in the district, and these are not among the least interesting of the contents of the Museum at Caerleon. Only four gold coins have been found in the vicinity, and those of chief numismatic interest in the list furnished by the reverend gentleman are the silver Carausius with the emperor on horseback. The rarity, the type and the workmanship of these coins constitute their value. The metal, too, of which they are composed, is much purer than that of other coins of the period.

It would be vain for us to attempt, within a short space, to enumerate the items of interest which have been collected in the Museum at Caerleon, and of which, in most instances, copious descriptions are furnished in the work under review. The people of Monmouthshire have just ground for pride in the possession of such an invaluable institution, and they are fortunate in having selected a gentleman well qualified for the onerous duty, to edit "Isca Silurum."

It would be unfair towards Mr. Palmer, the lithographic printer of Newport, to omit saying that, in the execution of the fifty-two whole page engravings which ornament the work, he has displayed an amount of ability which entitles him to the highest commendation. Mr. Lee himself was the artist from whose designs the engravings were made, and this with a view to lessening to the public the cost of the "Illustrated Catalogue." The volume is gracefully inscribed to Octavius Morgan, Esq., M.P., F.R.S., V.P.S.A.; and again we cordially commend it to the notice of antiquarians, archæologists, architects, and others.

EGYPTIAN RELICS.

THE results of Mr. Rhind's explorations in Egypt, and more particularly at Thebes, fully deserve that further consideration which we promised to give it, when on a recent occasion we were compelled to lay aside his book*, for the time, with but a very brief notice.

* Thebes, its Tombs and their Tenants, Ancient and Present. Including a Record of Excavations in the Necropolis. By A. Henry Rhind, F.S.A., &c.

Not satisfied with simply describing the results of the excavations, he offers at the same time a general view of Egyptian sepulchral facts. Nor is the value of his observations lessened to any considerable degree that although, from various circumstances, the results are but now given to the world, the researches from which they arose were made some four or five years ago. The sepulchral evidence on early metallurgic practice is a chapter of great value, and one that cannot fail to assist the enquirer in coming to a conclusion on what has hitherto been matter of much dispute. It has been customary, says Mr. Rhind, to suppose that the absence of iron relics among the innumerable spoils from the old tombs of Egypt, was sufficiently accounted for by the natural tendency of that metal to decomposition, especially liable to be hastened by the action of the nitrous soil or sand of the country. It is, however, objected in answer to this, and with truth, that as a general rule, the contents of the tombs were not in contact with the soil, for while the sand might, and did drift up the doorways, and into the outer chambers and shafts, it seldom reached the sepulchral deposit, even in cases where it had long previously been rifled and neglected; besides this, there was an almost total exclusion from air, and damp, all conditions favourable to the preservation of that metal. In carpentry, not only was iron not used, but it appears, from the relics, that no metal of any kind was employed, all framing having been effected either by dovetailing, mortising, or by wooden pins. Those who, following the dictum of Rosellini, insist, that iron and steel must have been materials in common use, because without them they could not have cut and sculptured granite, forget that, as Mr. Rhind recalls to recollection, the Mexicans performed similar tasks, and even graved emeralds with the highest finish, by the aid of bronze implements. Bollaert, in his "Researches in South America," mentions that the Peruvians perforate emeralds without metal of any kind; they use the pointed leaf of a wild plantain, with sand and water, and succeed perfectly. There would seem to be no real difficulty in the execution of any of the Egyptian work with which we are acquainted by the aid of bronze implements. Workmen's tools of various kinds of that metal have been discovered, and are familiar objects, having been preserved in many museums. But it is not so well known to what degree of excellence the quality of the metal attained. Bronze daggers of the earliest date, rival the elasticity of steel at the present day: carpenter's saws, chisels, fish-hooks, tweezers, and a rarer relic, a needle, in the possession of Mr. Rhind, are all bronze. True, some few objects in iron have at various times been discovered, under conditions which have perhaps too hastily been accepted as proofs of antiquity, but the conclusion must by no means be accepted without further enquiry. For instance, Colonel Vyse found a piece of wrought iron in an inner joint of the stones near the mouth of one of the air channels of the great Pyramid; but as that structure had long been the subject of constant quarrying and violation, the evidence of antiquity cannot be regarded as conclusive. Then Belzoni found an instrument of the shape of a modern sickle, under a sphinx, at Karnak, but the sphinx, with the rest of the group, were lying in an "irregular and confused manner, as if hidden in a hurry," so that there could be no evidence as to the date of the sickle found under such circumstances, and Belzoni, it must be inferred, found no other article of iron throughout the whole of his researches. Dathanasi wrote, "After eighteen years of laborious research, and after having opened so many tombs in Thebes, and in Abydos, I have not met with the most trifling article of ironware of Egyptian origin." It is believed that, of the few objects of iron which have been brought from Egypt at all, nearly the whole of them belong *certainly* to what is called late time in the archæology of the Nile Valley, and the author of "Thebes" believes that it is the case, "that there is no recorded personal observation, of the finding of any iron objects, under circumstances, or in connection with other remains, which would satisfactorily prove their having been contemporaneous with remains of the older date in question. For example, Colonel Vyse intimated that the Duke of Northumberland was stated to have brought an iron weapon from Egypt; but the Duke of Northumberland informs me that he knows of no such object." Indeed, it would appear, that in every case in which iron relics have been discovered in Egypt, there is invariably a link wanting in the chain with which it is sought to connect them with early ages.

The fact is, the modern demand for relics, Egyptian as well as others, has produced a certain supply independent of that obtained by actual research; and no doubt to their supply must be ascribed many articles which have come to be looked upon as veritable antiques. How far this applies to relics from Egypt may be readily gathered from the ninth chapter of Mr. Rhind's volume, wherein he describes "some characteristics of the mode of dispersion (of relics), whether by traffic or otherwise, which has brought, and is still bringing, so many Egyptian relics into public and private collections."

The spoliation of Egyptian monuments dates from the time when

obelisks were carried away to be re-erected in the imperial cities of Rome and Byzantium; and, again, from the close of the middle ages, when mummy, as a drug, was so favourite a recipe, that dealers embalmed their dead contemporaries to meet the demand which the ransacked tombs could not supply. By the earlier half of the seventeenth century, Kircher had made considerable progress in the mysteries of the hieroglyphics, and about 1655 Thevenot, a French traveller in Egypt, describes the Arabs of Sakkara as continually occupied in digging among the tombs for the purpose of selling the objects which they might discover. The first collection, however, of any importance procured systematically, was formed by the scientific commission which accompanied Napoleon's military expedition in 1798. A few years later the pursuit was in full progress on an extensive scale; and from that time to this it has never ceased. The chief collectors having been the consular representatives of England and France, Mr. Salt and Signor Drovetti, the example of organising a regular search was soon followed by others, and particularly by Belzoni, when, after a rupture with Mr. Salt, for whom he had been acting, he set to work on his own account. "The history of relic-gathering in those days is that of one long imbroglio. There were quarrels and even fights between the working parties of rival collectors. There were difficulties from intrigues and counter-intrigues with corrupt local governors. There were disputes between employers and employed, as to the terms of service. There were misunderstandings in the communications of sellers and Government buyers in Europe on involved questions of price and public duty. There were even, at least locally, sparks of national ill-feeling aroused, chiefly between English and French, in consequence of the right of property in tombs, or such like, assumed to vest from priority of discovery, being sometimes infringed." Later, in 1828, the united French and Tuscan commissions, directed by Champollion and Rosellini, began their labours, the chief object being the investigation of the monuments and the publication of the results. The acquisition of antiquities, however, naturally followed; and the Louvre and the museum at Florence were greatly enriched. In 1842-5, a Prussian expedition, under the direction of Lepsius, made large collections in Egypt for the Berlin Museum. In 1851, and succeeding years, the Louvre again received most valuable additions by M. Mariette's discoveries: and, more recently, the Egyptian Government itself has begun the formation of a collection, under the agency of the same investigator. But, notwithstanding the magnitude of these official operations, they have been far exceeded by the collective efforts of private persons, such as Passalacqua, Cavighia, Cailliaud, and others, who "brought together considerable treasures, by engaging, directly or indirectly, in excavations; and most of these have found their way to the museums of Europe. Other collections were formed by European residents in Cairo and Alexandria, whose tastes or opportunities led them to seize the advantage of their position, and secure from the *fellah* diggers, or the class of go-between dealers, any really good relics which then, from a less exhausted source, came more numerous into the local market." Besides these there was the native traffic by the villagers, who, particularly at Geezeh, Sakkara, and Thebes, were constantly working among the tombs, sometimes on their own account, and sometimes under the guidance of an employer. Dathanasi lived for eighteen years at Thebes, engaged in this manner, so that one would expect to find the whole of the remains thoroughly ransacked. Such is, however, far from being the case, so well as can be judged; but the investigations, so far as they have gone, have been attended with sad destruction to the monuments, and not only by those who have not hesitated to use the temples as quarries, or the *fellaheen* who burn suitable stones into lime; for the scientific expeditions have not been blameless in the matter. Mr. Rhind, while admitting the difficulty of determining where the line is to be drawn, instances the case of the Prussian expedition under Lepsius, who, in the most magnificent tomb in Egypt, that of Sethi I., where corridors, halls, and pillars were in perfect preservation, is stated to have overthrown a decorated column to secure a portion of it, leaving the remainder a scattered relic on the floor. This, and other doings of a similar nature, do not contrast well with the veneration with which these remains of ancient art were regarded by Wilkinson, Hay, and Burton, who about the same time laboriously examined and sketched the figures on the walls by the dim light of wax candles, rather than injure the paintings with the smoke of torches.

But let not the collector of Egyptian antiquities believe too confidently in the genuineness of relics, because they come from Egypt, for the production of spurious relics is carried on systematically, and to a considerable extent. The ordinary *fellaheen* shape soft stone into imitations of large scarabæi; fasten up scraps of papyrus into the semblance of small untouched rolls; char handfuls of their last years' crop, and mix it with bituminous dust to give the grain the colour of wheat from the tombs; scratch the royal cartouche on an ordinary vase, and other deceptions, which, however, fail to impose on

the experienced. Certain dealers at Cairo, among whom are Europeans, attempt more than this; they engrave inscriptions accurately copied from a set of viscera vases, on others that may not possess such a feature, and whose value is thereby increased fivefold; then bronze figures of deities of the rarer types are multiplied with unimpeachable accuracy; the originals, even, being sent to Italy for the purpose. One Ali Gamooni, at Thebes, is great in the production of scarabæi, which form his chief manufacture. The material he employs is generally that which the ancients themselves also largely employed, a close-grained easily cut limestone, which, after it is graven into shape and lettered, receives a greenish glaze by being baked with brass filings. Working in this way, says Mr. Rhind, some of his copies are singularly good, and as for his examples of the unimportant coarser sorts, which the old Egyptians with little care seem to have produced in the same manner, they are not to be distinguished from antiques.

It seems that, twenty years ago, Ali Gamooni was engaged in this trade; for a writer on Egyptian subjects notes that he then furnished Ali with appliances to aid his already manifested talent, in the hope of flooding the local market with curiosities, and so saving the monuments from being laid under contribution (1). Since that time, however, the ambition of Ali has led him to more important forgeries, and on the faith of Mr. Rhind's having been several times in his workshop, and having seen the mysteries of his art, he one day presented a sketch of a group of hieroglyphics, neatly drawn in pencil by himself, to beg advice as to his engraving them on a scarabæus. The text, he said, he had copied accurately from a wall of Medinet Haboo, but he added, that for a cartouche with a king's name, which the original there contained, he had substituted another which he found to be of uncommon occurrence, with the view of preparing a rarer, and therefore more valuable relic, and he wished particularly to ascertain whether there would be any inconsistency between the adopted name and the inscription. The narrator is not aware if this had been his first attempt in so remarkable a field, but remarks that the result of a few happy shots in this direction it is rather startling to contemplate, if we remember that under some of the kings, and particularly Amunoph III., the practice was much followed, of inscribing large scarabæi with important records; the frontiers of his empire have been defined on the authority of four such relics, and an incident so important as the first indication of the introduction of an heretical sun-worship has been founded upon one of them.

We may return to Mr. Rhind's book; but with regard to relics, may repeat with him, that the time is fully come when Egyptian antiquities, of certain classes, must have a further voucher for their authenticity than merely that they have been carried from Egypt.

DISTINGUISHED MEN OF SCIENCE.*

WE are glad to be able to inform our readers, that a large engraving has just been completed by Mr. Walker, of 64 Margaret Street, Cavendish Square, in honour of the men of science who have done so much towards the establishment of our present commercial prosperity. This work, which may well be called historical, represents fifty-one illustrious men, living in the early part of the present century, assembled in the Upper Library of the Royal Institution. The picture is divided into three groups, and comprises authentic portraits of our greatest inventors and discoverers in astronomy, chemistry, engineering machinery, and other departments of science. The central group represents Watt, Boulton, Brunel, Dalton, and Cavendish seated, and surrounded by Smith the geologist, Wollaston, Davy, Maudslay, Bentham, Telford, Murdock, Rennie, Mylne, Chapman, Jessop, and others. On the right are Crompton, Cartwright, Tennant of Glasgow, Francis Ronalds, and Charles, Earl Stanhope, engaged in conversation; while a little behind stand Bryan Donkin, Troughton the optician, Miller of Dalswinton, Synnington, Trevithick, &c. The remaining group on the left is formed by Herschel, Maskelyne, and Jenner, surrounded by Bailey, Frodsham, Leslie, Playfair, Dollond, Dr. Thomas Young, Brown the botanist, Davies Gilbert, Sir Joseph Banks, and Captain Kater, celebrated for his pendulum experiments. The grouping of so large a number of figures must have been a difficult task; this has, however, been successfully accomplished by John Gilbert, the designer of the original picture (drawn by J. F. Skell and W. Walker), who, by a skilful combination of various attitudes, has given both grace and ease to the figures represented. The engraving has been executed by William Walker and George Zobel, while the greatest care seems to have been taken to secure faithful and authentic likenesses. The work is rendered complete by a series of well-written memoirs, drawn up by Mr. Walker, jun., to accompany the engraving;

* Published by Messrs. Walker and Son, 64 Margaret Street, Cavendish Square. The book of Memoirs also to be obtained of Messrs. Spon, 16 Bucklersbury.

this book, we are glad to see, is also published separately, as we should think there would be many who, though unable to purchase the engraving, might still like to possess the memoirs.

LABOURERS' COTTAGES, AND THEIR BEARING UPON ARCHITECTURE.*

(Concluded from our last.)

I HAVE as yet said nothing upon one part of my proposed subject,—The bearing of Cottage-building upon Architecture, properly so called. There are several general observations which I have made which obviously apply equally to the simplest and the most ornate buildings; and there is one particular feature, the cottage treatment of which seems to me, though unexpectedly, yet exactly to tally, with what I should recommend for larger houses also,—I mean the treatment of the staircase. We have seen how, in the cottage, by far the most economical, as to space and cost, as well as the most convenient plan, is that which attaches it to, not complicates it with, the general block of the house. I think the same principle should be applied to all staircases, making them rather excrescences, or annexes, than contained within the main walls of the house. I hardly ever see a plan for a modern house, where the insertion of the staircase does not seem to spoil the arrangement and communication of the rooms—at any rate to curtail the hall or darken the passages; and I have seldom found a difficulty in finding a place where, if the staircase were annexed to the general block of the building, the ill-arrangement might not be obviated, and many additional conveniences gained. As to the lighting and airiness of the staircase itself, and the external beauty so naturally obtained, I need not say a word. We all know how much the finest examples of old domestic architecture owe, both internally and externally, to this separate treatment of the staircase. I would almost believe that, by the improved combination of spaces, which this gives to the general plan, even the additional expense would be small. Certainly, if the smallest margin were allowed for effect or ornamentation, nowhere would it be better bestowed; and the variety and originality of design which such a feature would offer, and almost necessitate, would, I think, advantageously compensate for the absence of much applied decoration in other parts.

Nor need I say how strictly applicable to the highest class of buildings are those principles which are absolutely imperative in the cottage: viz., that effect should be obtained not by straining to produce it, but by carrying out in good proportion, and combining in due harmony, what is essentially requisite for the convenience of the house; how entirely all shams and concealed constructions are to be eschewed; how the interior wants of the house must give the character to the outward elevation, and not a preconceived elevation warp the interior arrangements to its lines. I am convinced that, of all the so-called picturesque cottages built during this century, the external view was drawn before the ground plan was designed—indeed, fifty years ago, I think that this must have been the professional practice with regard to all classes of buildings. And even now, I fear, the picturesque idea of what is wanted for a certain site floats through the mind, before the prosaic wants of the future occupier are listened to.

But there is yet one still more distinctive practical bearing of cottage-building upon high architecture which I would insist upon. It is a Utopian idea to suppose that we shall ever again acquiesce in a single national style of architecture. The ages of the overpowering influences of master-minds, and of the crushing power of dominant majorities are gone by, in that as in other things. Individual mind will assert its independence, though often, indeed, more to the satisfaction of the person than of the community. And we may expect, more and more, that crotchets will be prominent, and that "follies" will be built—only this divergence will become so common that they will no longer be called "follies." Still, one style may be the most competent judges be deemed more suited to our climate and requirements than another, and, if ably treated and proved by experience to be so, it will become generally adopted, and so, in a limited sense, be national. For ultimate success, it is necessary that it be both founded on the examples of past times and developed to the exigencies of the present. There is nothing good in old architecture which it must eschew—nothing good in new discoveries of material or construction which it must not adopt. It must be free alike from pedantry and new fangledness. Eclectic, in one sense, it must be; but it must have a pervading principle, and this, I think, it must seek whence the principles of all our great institutions are derived in the past history of our own country. But the style will only establish itself by its success. No foregone theory is of any avail. It must prove its own self "Solvitur edicando." I need not say that I myself would have no confidence in the permanence or prevalence of any style in England that was not founded on our old English architecture; and that that is a feeling ingrained in the national mind, the history of cottage building shows. Whenever far in the country, away from schools of design or provincial Pecksniffs, building has gone on traditionally, uninterfered with by lectures or books, there the old English style has prevailed; and what are really cottages of national Gothic (if I must use that term) have been built within the last fifty years.

While the fashion of the day raised the neighbouring squire's hall in Jacobean, Caroline, Dutch, Palladian, Grecian, mock-Gothic, Italian, Byzantine, one after the other, whatever happened to be the prevailing mode in London circles, the village mason in many stone districts of the midland

counties went on by his rule of thumb, following the old forms of doors and windows, grooving the same mouldings, fixing on the same heavy hinges, glazing with the same quarries—making the modest house he was building for himself the veritable offspring of the abbey, and the castles, and the granges which were lying neglected in ruin around him. It is curious how, every now and then, in out-of-the-way villages, we come to windows inserted in the churches within the last two hundred years infinitely more true in character and detail to the style of the church than the insertions of revived Gothicism. But in cottages and small farm-houses the tradition of national style was absolutely unbroken; the mouldings, indeed, latterly became more flat, and the elevations more insipid; the impress of the outside wood was visible enough upon them to show that it was not mere Chinese copyism, but a living style; and so continuous was it, that I feel sure that in the county of Northamptonshire alone a diligent student might make a catena of such buildings from the fifteenth century to the nineteenth, from the inscribed dates still existing, without an interval of more than ten or fifteen years in any generation.

But this tradition has now almost, if not entirely, passed away. With the carpenter it is certainly extinct, and his moulding planes are now of the so-called classical type, and the few books to which he has recourse all point to the same stereotyped patterns. All handicraft work has now got into this one groove; and architects will, I think, bear me out in saying, that if a common workman (I will not say in ecclesiastical, for the demand for churchwork has already formed a school of its own, but) in domestic work, if a common workman is left for a moment to his own devices, however mediæval may be the character of the designs on which he is engaged, he at once falls into the conventional classic style of his apprenticeship. It is this which gives an unreal character to the prevalent mediæval architecture. A house is built, in which the architect has given the most correct forms for all the leading features, nay, has drawn out all the details, preceded or characteristically developed, in the style he has adopted; but no sooner is the workman left to finish off by himself a shutter-panel or a door-handle, than the vulgarest type of the workshop is straightway introduced, marrying the effect and reality of the whole composition.

Now to meet this, I know of no way but by established architects condescending to give to the cottage-builder the most elegant yet the simplest forms that the commonest use of brick and wood can adopt. Architecture of course has risen, historically, from the hut to the palace; but, when once established as an art, it has descended in its influence from the palace to the hut.

It would be pedantry to suppose it possible to reverse this order now; and to argue that our new style, or new development, must begin from the simple elements of good cottage building; and so rise till it modified the mansion or the church. But practically, I believe, we shall never have a real living style, till we have imbued the workman with true principles in the use of the wood and the brick with which he makes the doors and cornices of his own dwelling. We must, in the instance of the carpenter, teach his good sense to use the simple chamfer, and his fancy to design the pleasing stop-chamfer, in the place of the mouldings and dovetailing, to which he is wedded. We must make him, as it were, begin afresh; using wood in the bold natural style in which our ancestors used it five centuries ago, but without pedantically tying him to any normal forms. If we could once get true principles of carpentering into our cottages and our builders' workshops, we should have the base of a national style to work upon, and need have no fear of missing a right development. Now, in the commonest buildings there is a waste of labour in bad forms and surface polish, which are much more costly than well-proportioned realities; and the simple beauty of constructional form is almost always distasteful to the workman, and he labours at it against the grain. How we are to attain the outward truth of construction, whether by beginning to educate in our workshops and cottages, or by carrying it down to this humbler sphere by the successful results in higher art, it is not for me to say; but I believe that if we could, as a rule, get rid of all shams and false ornament in our cottages, the improvement would gradually rise upwards, and our builders would not be, as now, working in a conventional groove of their own, unpermeated by any living principle, and with no sympathy with the higher art of the architect.

It is on this ground that I would ask the most exalted architect not to deem cottage building beneath his care. I think he would there learn reality. He would work up from the rudest form of materials and constitutional necessities, to the most precious substances and the highest art. If I were conducting an architectural studio, I should first put before the student, not an elaborate frieze, or a diapered panelling to copy—not a portion of the Parthenon or of Westminster Abbey—but a well-designed and well-fitted cottage; make him learn how to fix the lintel of a door in carpentry, or chamfer the brick of a window-jamb—and so gradually carry him onwards to higher things. We seem greatly to want, in an educational view, a return to simplicity. If there is an architectural sketching club, I wish they would take for a subject at their next meeting a five-chambered cottage. I believe they would find it a more difficult problem than a Palladian hotel, or a mediæval town hall. But till real genius has undertaken this, and given the key-note to the proportions of windows and chimneys, and the details of doors and staircases, we must be content with the abortions which exhibit themselves at model cottages, many of which, while failing in real accommodation, are eyesores to every educated beholder, and seem absolutely to rejoice in their ugliness, as if the absence of beauty ensured convenience of plan. I am convinced that there is no

* Paper read by the Reverend Canon JAMES at the Architectural Museum, South Kensington.

necessary connection of ugliness with usefulness in a cottage, more than any other building. Indeed, I believe that the true expression of usefulness will be always beautiful; but then, in the present state of art-work education, we cannot leave this expression to the bricklayer and the carpenter, but must look to the refined mind of the true architect to condescend (if it be so considered) to design the building under which the man, who carries out his noblest ideas into form, lives day by day, and imbibes unconscious lessons.

A simple "handbook" of good primitive forms for wood and brick, and stone construction—with the component parts of structures in good proportion, and working drawings and sections of details in each material, such as might be required for their own homes, put into the hands of the apprentices of the present generation, might in time work a great and glorious revolution in British art. I wish the idea would commend itself to some one of the distinguished professional members of our architectural museum which professes especially to take the art-workman under its care.

The idea may seem too trivial and simple; but I own, that among the many more ambitious propositions for raising the character of our national architecture, I can myself see no one that has better promise of ultimate success.

FOXHILL, NEAR LEEDS.

THIS house, of which we give an engraving on the opposite page, is situated at Weedwood, a few miles from Leeds, and is built on the brow of a thickly-wooded bank, shelving rapidly down to a small streamlet, the Adel Beck (beck being the Yorkshire name for a rivulet). It is built of sandstone, partly quarried on the site and partly obtained from the Weedwood quarry, which is close at hand. From the flat roof of the tower, over the entrance, very extensive views can be obtained on all sides, as there is very little, if any, higher ground for many miles round. The view shows the south-west and south-east fronts. The library window and large bow of drawing-room are to the south-west; the smaller bow of the drawing-room, that of the dining-room, and the window of the morning-room between them, are to the south-east. The receding wing contains nursery accommodation on the first floor; kitchens, larders, &c. (north-west); and butler's pantry, servants' hall, &c. (to south-east), on ground floor; and wash-house, laundry, wine cellars, &c., on basement story, which is entirely above ground on south-east side.

The house is entered by an open porch in the tower, hall, with cloak-room and saloon, from which the four principal rooms are entered, and from which the principal staircase ascends. The servants' rooms are on the top story of the main building.

The glass porch, seen to the right of the dining-room window, is to the garden entrance; and the conservatory stands immediately in front, at the end of the terrace flower garden.

The contractors are,—Whiteley, mason; Winn and Pawson, joiners; Watson, slater; Webster, plumber and glazier; Singleton and Tennant, smiths; Branton, plasterer; Wood, painter.

ON THE FORMATION OF A NATIONAL MUSEUM OF ARCHITECTURE, VIEWED IN CONNECTION WITH ITS BEARINGS UPON MEDIEVAL ART.

ON Tuesday evening, Mr. GEORGE GILBERT SCOTT, R.A., F.S.A., delivered a Lecture in the Theatre of the South Kensington Museum, before the members and friends of the Architectural Museum, "On the Formation of a National Museum of Architecture, as viewed especially in its connection with the Mediæval Styles." The chair was occupied by the President of the Architectural Museum, Mr. A. J. B. BERESFORD HOPE, who briefly introduced the lecturer.

Mr. Scott said:—

Having been somewhat actively concerned in the first establishment of the Architectural Museum,—and the collection there made having been either temporarily or permanently deposited in the hands of a government department, who are supposed to have in contemplation the formation of a National Museum of Architecture, I have thought it not out of place to offer some suggestions as to what such a National Museum ought to be; but, in doing so, to direct my attention more particularly to that part of it in which I feel most interest—that which would illustrate the architecture and the arts of the middle ages.

A museum may be defined as a depository in which objects, illustrative of science and art, are collected and exhibited for purposes of instruction and study.

Its great uses are to facilitate the studies of those who cultivate the arts and sciences which they illustrate, and to excite interest in them in the minds of others. They have also a secondary use, as being places where objects of interest, which would otherwise be likely to be lost or dissipated, or to perish from decay or other causes, may be cared for and permanently preserved.

When the museum is public or national, it performs, or should perform, these duties, on a grand scale, and for the use and benefit of the public.

Limiting our consideration to a museum of art, I would say that its directors ought to devote their energies primarily to collecting such objects as are worthy of the study to the practical student of art, and as would tend to form the public taste upon a true and healthful standard. Secondly, to the illustration of the history of art in its various schools and periods; and

thirdly, to the conservation of such movable specimens as would otherwise be in danger of being lost or destroyed, provided such works are of actual merit or of value as bearing upon art-history.

Concentrating, again, our attention upon architecture and its subsidiary arts, let us endeavour to apply to it the general rules above stated.

An architectural museum should illustrate the history of architecture, and it is hard to conceive of anything more interesting than a collection which would really and honestly perform so noble a duty.

The history of architecture is the history of the world; it is the history of the changing power and dominion of races and nations; it is the history of human thought, and of the growth, the fluctuations, the decay, and the revival of human civilisation; and worthily to illustrate such a subject would be indeed a noble undertaking! This should not, however, be the primary aim. The great and vital object to be aimed at is the actual promotion of art amongst ourselves, and it is to this object that the best energies of those engaged in such a work should be directed. In the first place, it is pretty obvious that, while illustrating in their degree other classes of architecture, such a museum should be mainly devoted to the two great classes of architecture which are actually practised amongst ourselves, and which are familiarly, though somewhat unmeaningly known as "Classic" and "Gothic."

It may be asked why these two classes of art should be selected from among the multitude which have prevailed in different ages and countries. Is it merely from the accident of their chancing to be practised by us at the present day? By no means. The reasons are founded both upon history and upon intrinsic merit. Classic architecture founds its historic claims, firstly, upon the great fact that it originated among those nations of antiquity whose glorious privilege it was to unite in one main channel the several streams of the civilisation of the ancient world, to collect and concentrate all that was worthy of perpetuation in its previous course, and to bring it, with its arts, sciences, and literature, to the highest perfection which they attained; and, secondarily, upon the fact, not much less important, that what remained of the civilisation of these favoured nations of antiquity supplied the germ from which a second civilisation sprang—that of which we now enjoy the blessings.

Gothic architecture, on the other hand, founds its historical claims on the fact that it is the indigenous architecture of that family of nations to whose custody that new civilisation was committed, and that it belongs to ourselves as a leading member of that family; and that, though it has for some centuries been superseded by the revived architecture of the ancient world, it is now in its own turn revived by those nations among whom it originated, and is familiarly used by them side by side and on equal terms with that which had for a time supplanted it.

I will not dwell upon the former of these branches of art; but will now concentrate my attention upon that in which I personally feel the greatest interest, and the illustration of which, through the medium of a national museum, is the subject of my present paper.

I will first state—what often seems to be lost sight of—that it was not the historical claims of this style of architecture, strong though they are, which brought about its revival. Its opponents often seem to suppose the converse of this, and to think that, by directing their arguments against those claims, they shall undermine a movement which, gloriously supported though it is by historical claims and associations, originated wholly in an appreciation of the merits and beauties of the architecture, and its suitability to our wants. On this subject, however, I will not dwell further than to say that if you do not feel the beauties and perceive the intrinsic merits of this wonderful style of architecture, I fear it would be hopeless for me to attempt to convince you of them. If you wish to know my views on this point in detail, I will take the liberty of referring you to the first and the last of my lectures at the Royal Academy. They are reported in the *Builder* and *Building News*, in March and April 1857, and in February 1860.

Now, let us digress for a short time to consider what are the means by which a practical art like architecture is to be most successfully learned and its advancement best promoted.

Architecture, it should never be forgotten, differs from the sister arts of sculpture and painting in this great and most important quality; that its productions are not the actual handiwork of the leading artist himself, but that it unites under its banner not only its two noble sister arts themselves, but also an almost innumerable train of subsidiary arts, each of which contributes its quota towards the perfection of the architect's work, and vies with others in rendering it noble and magnificent. When we speak, therefore, of architectural instruction, we mean, not only that of the architect himself, but of all the artists who work under his banner.

It is a general fault in England, at the present day, that those who follow a practical art take too low a view of its artistic as distinguished from its practical element. Thus, with our manufactures, the workmanship is often excellent; the taste very rarely so. Our artisans are often giants in mechanical skill, but pigmies in art.

The same has been the case with the arts subsidiary to architecture; and, though a great revival has taken place, those who have advanced the most best know how great is still the need of reformation.

This reformation must, however, begin at the fountain-head. The same precedence of the mechanical over the artistic which has obtained amongst our manufacturing and our architectural workmen, has existed also amongst architects themselves. We do not wish to be less practical—far from it!—but to be more artistic. And, if we aim at raising the architecture of our day as an art, we must begin by giving a more distinctly artistic tone to the education of our architects. The absence of any recognised and

[The following text is extremely faint and largely illegible due to the quality of the scan. It appears to be a multi-column document, possibly a ledger or a list, with various headings and entries. The text is organized into several distinct sections, some of which are separated by horizontal lines. The overall structure suggests a formal record or a detailed report.]

defined facility for obtaining the class of instruction required to supply this very general need, is one of the greatest hindrances to the advancement of our art. The Institute of British Architects have been considering for a long time past the organising of a severe examination of young architects; but they have never, to my knowledge, taken any step to aid their education. The junior institution (the Architectural Association) have, in some degree, taken the matter up, and have established classes for mutual improvement—a step worthy of all praise, and the furtherance of which merits the serious attention of every lover of architecture.

If there are present any students of architecture, let me earnestly and seriously press this subject upon their attention. In an architect's office you can learn the more mechanical and business-like parts of your art; and you there, and there alone, learn the application of such artistic skill as you may possess to actual and practical work; but that *artistic skill itself* must be acquired elsewhere, and by your own individual exertions. I wish it, however, to be distinctly understood that the artistic skill I am speaking of relates to *applied*, not *pictorial*, art; that which will make your buildings noble works of art, as distinguished from that which only enables you to make pleasant pictures of them. This last-named class of art is not to be despised; it will further your interests. If you are also an artist in the higher and more practical sense, it will do good by commending your good designs to public favour; while if you fail in skill of this higher class, it will do great harm by obtaining favour for your *bad* designs.

When real architectural art was highest this pictorial power was not much cultivated. It is not infant *architectural* skill, but only the means of promoting the adoption of the approval of your designs, whether good or bad. As bad designers often possess it, or can obtain its aid, do not by any means neglect it, or you will give them an advantage over you; but always remember that, like eloquence, it is a mighty engine of good or evil, according as that which it commends to popular favour is noble or vile. The artistic power, however, which I am urging you to cultivate is the power of making noble designs, and of clothing them, when circumstances permit, with noble decoration, whether in the form of architectural carving, sculpture, painting, or other decorative art. The first part—the power of actual architectural design—cannot be acquired without the most careful, determined, and continued study of existing works, accompanied by a constant, though not a self-confident, criticism of their merits and their faults. It is ridiculous to suppose that such an art as architecture is to be learned without the most careful study of its existing productions, or that originality is likely to be developed upon a basis of ignorance; and it is equally unlikely that excellence will be attained solely through the medium of knowledge, without the most jealous and careful training of the eye to the most delicate and scrupulous perception of the right and the wrong in form and proportion. The want of this is the most crying sin in modern architecture, especially, I fear, in this country. Continually is the more cultivated eye offended by disorders, which in music would set the very teeth on edge. I know not how to advise you on this point. This delicacy of perception is in some degree intuitive, but that it is not wholly so is proved by the fact that the works of some periods are nearly all harmonious, while at other periods this harmony seems only occasionally to have been attained. The only rule I can suggest is the *jealous cultivation of the eye*. As the greatest of moralists has said, "Keep thy heart with all diligence, for out of it are the issues of life," so may one say to the architect, "Keep thine eye with all diligence, for out of it are the issues of art." Never allow your eye to get accustomed to or to condone errors of proportion, even in works which in other respects you venerate for the noble art which clothes them, and much less allow of any deliberate error in your own designs. To avoid these blemishes, sketch your designs over and over again, no matter how slightly and roughly, rejecting vigorously everything against which the eye rebels, and never permitting a proportion which it has once condemned to remain even for a minute before you, for ocular perception is most delicate, and its instincts may be blunted by dwelling even for a few seconds upon what its first impression saw to be wrong. Never clothe a form with detail or with pleasant drawing till its proportions have been thoroughly sifted and rigorously corrected; and if you fear that you have, by dwelling too long or too indulgently upon what you have sketched, prejudiced your eye in its favour, put it away and attend to something else, or take the opinion of some unprejudiced person in whose correctness of eye you have confidence; for first impressions of another will often correct your own.

As to obtaining a knowledge of architecture, I cannot too often or too strongly urge careful sketching from first-rate examples. The student of classic architecture is under a disadvantage, as its original and best examples are in other lands; but with those who pursue the other great branch of architectural art, the case is very different; for though in most parts of Europe he will find constant and ever-varying objects of study, he can never go far from home without finding among the monuments of our own country productions equally deserving and equally instructive. To the student, then, of Gothic architecture I would concentrate my advice on this point in one word—"SKETCH!" And, if any one advises the neglect of this, I assure you that he stands *ipso facto* self-condemned as a false teacher. I want you, however, to add to this a great deal more. I want you to obtain distinct and precise instruction in art in all its bearings upon architecture. I want to urge upon you to study figure-drawing, animal-drawing, the drawing of foliage, whether natural or architectural, the combination of figures and animals with foliage, the designing of coloured decoration in all its branches, and of every other decorative art which

bears upon architecture. I want to urge upon you the necessity for the systematic learning of all these kinds of drawing, and the obtaining of a perfect mastery of them; and not only this, but that you should learn, in some degree at least, the actual practice of these arts. Human life is not long enough to do the latter thoroughly; but now, in the days of your youth, you can do it to a certain extent, even at the sacrifice of a few frivolous amusements. You have embarked on a noble art. Make its cultivation take the precedence of all inferior pursuits. To effect this, I am disposed to think that combination is necessary. A society of students might be formed, and aided by others, for obtaining the best instructors in all these branches of art, which each student singly would find impossible. I earnestly commend this to your united consideration. And, above all, do it at once, or your own individual share in the coming reformation will be lost.

I will only add one piece of advice to young architects. *Do not make Opinion a substitute for Art.*

There is at all times an ever-varying set of opinions afloat as to matters of art, — and those who ride on the wave of the last-received opinion of their party — be it good or bad — are apt to be viewed by themselves and their companions as oracular, quite irrespective of their own attainments or skill. What I would, then, say is this; hold what opinions you like, so long as you make yourselves artists, and you will come right in the end; but hold what opinions you like, if you neglect to make yourselves artists, you will never be good for much.

I will add another suggestion. Never let your appreciation of the demerits of the present age in matters of art lead you into a sneering, supercilious, and contemptuous way of speaking and thinking of what you see; but rather let it impel you onwards all the more vehemently in making *yourselves* exceptions to the censure you pass upon *others*. We continually hear persons speaking in a discontented and hopeless tone of contempt of what others are doing, without exhibiting any very strong signs of exertion to acquire real powers of art *themselves*. I urge you to reverse this habit, and learn to think kindly and favourably of the efforts of *others*, while you keep up a *rigorous censorship over yourselves*. And make all you see in others, whether of success or of failure, act as only so many incentives to the determined pressing forward of *your own* artistic training.

What I have urged respecting the artistic education of the architect himself, applies almost precisely to that of the architectural art-workman. He has an easier task, because his efforts are concentrated upon a single art; while on the other hand, he suffers severely from his very limited facilities of obtaining instruction, and of seeing objects worthy of his study. The aim, however, is precisely the same; and I would say to the art-workman as to the architectural student, make yourself really an artist; jealously cultivate a delicate accuracy of eye; diligently study the finest productions of your art in its best days, and add to all this (or I would rather say, unite with it, and thoroughly mix up with and *knud* into its very substance), a constant, devoted and loving study of the productions of nature, whether animal or vegetable.

I think with art-workmen as with architectural students the greatest hope of obtaining a real artistic training would be in combination for self-improvement — a clubbing together to obtain instruction in drawing, &c. I would especially urge the cultivation of figure and animal drawing. In this our carvers, &c., are the most deficient, and to this they should direct their best attention; not so much with the direct object of becoming figure sculptors, as to facilitate the free introduction of animal life in combination with architectural carving, a power which our best carvers very rarely possess, but which is absolutely necessary to the perfecting of their art.

Now, with the actual student, as distinguished from those who have made a certain degree of proficiency, there can be no doubt that the best training is frequent and careful copying (whether by drawing, modelling, or carving) from models of undoubted merit. Every art is acquired in the first instance by submitting implicitly to routine: no one would believe that the mechanical drilling which a soldier has to go through, would do much to teach him actual fighting, yet it is found practically that success absolutely depends upon it, and so well did the ancient Romans know this, that — as Gibbon, I think, remarks — they called their army by a name not derived from their ultimate duty of *fighting*, but from their preparatory duty of exercising. No one, again, would believe that the dumb show called "position drill" would make a man a good rifle shot; and a thousand parallel cases could be instanced to show how skill in any pursuit is to be attained by submitting, for a time, to what may be accounted as *drudgery*. Art is not an exception to this rule, and I would recommend its younger students (and perhaps others, if they have not already passed through the ordeal) to put themselves through a diligent course of the most careful drawing or modelling from the best examples they can find, before they venture upon a freer line of study. By this they will attain a correct appreciation of truthfulness of line, and of the importance of precision of detail, and they will find that it will greatly facilitate their future and less mechanical studies, and in the end promote, rather than fetter, originality.

It may appear that I have been departing widely from the subject of my paper; the very contrary is the case. It is useless to treat of what a museum of architecture should be without first considering its necessity and the uses it is to serve.

I think what I have said respecting the art education of architects and architectural workmen will make this pretty clear.

Architectural students may, it is true, visit the actual buildings which contain the objects of their study, they *must* do so indeed, and they *do it*; but, even with them, it is impossible to do this so often and so systema-

tically as to form the staple of their studies. They need, in addition to this, facilities for constant practice and self-tuition, they want a place where they may continually refer to the finest examples, where they may pursue their studies and practise their hand and eye continually, and on all occasions when a spare hour is at their command.

And if this is so necessary for the student of architecture,—nay, for the architect himself,—how greatly more pressing is its necessity to the art-workman! Instead of wondering and saying ill-natured things about the deficiencies of our carvers, &c., it seems to me half miraculous that they should be able to learn their arts at all. Those who have aimed at classic art would have never seen its original productions at all, were it not for the specimens collected in museums; and even those who follow the Gothic revival, though its original productions are around us, have usually neither time nor money for visiting any but those buildings immediately within their reach. This is still more emphatically the case with the young apprentice. His time is not at his own disposal, and the only opportunity he has for self-improvement are his evenings.

The formation of the Architectural Museum in 1852 was the first and has been the only step taken to aid him. Till we, the architects who everyday of our lives witnessed and experienced this pressing need, came forward ourselves to supply it, nothing was done to aid the neglected architectural workman, and to this moment we, in the main, stand alone as his helpers.

I do not wish to boast of what we have effected, but it would be unjust to our great cause to abstain from asserting that the good done by the formation of the Architectural Museum is beyond all calculation. From the time it was first opened in Cannon Row, the improvement in architectural carving became most marked and indisputable; and the same influence for good was visible among such architectural students as availed themselves of it. Its influence has been somewhat reduced by the remoteness of its present habitation, but it still continues; and I think I see means of meeting this unavoidable disadvantage. It was our limited funds which led us to take up our quarters at South Kensington, and the same cause has rendered us powerless to resist a series of circumstances which has brought us more directly than at first under the régime of its autocratic government.

If that governing body should take up our work for us, and carry it out with a true appreciation of its importance and its necessity, we need not feel ourselves annoyed at the transference of our powers and our labours to a body so richly endowed with worldly goods.

I warn them, however, with all seriousness, of the responsibility they have incurred. They have done their utmost to render practically powerless a body of men who, at a great sacrifice of time and money, have come forward to initiate a work of the most urgent necessity, which the Government had always refused to do. They have the pecuniary means for carrying on this great work. If they neglect to do it, if they do it inefficiently, and if they refuse the aid and advice of those who have launched the Museum into existence, they are, in their own individual and personal reputation, answerable to the public and to posterity for the consequences. If, on the other hand, they will take it up in all honesty and heartiness, I can only say that we shall rejoice to aid their efforts in every possible way; and that they will, personally as well as collectively, earn the lasting gratitude of all who care for our noble art.

I cannot, however, omit here respectfully, though in the most emphatic and in the strongest manner, to protest against any attempt to dismember our Collection, otherwise than with the full permission and consent of those who have formed it. A collection like this must of necessity require periodical revision. That revision, however, *must* be effected by, or in full concert with, those who made the collection. I have personally taken an active part in doing this, and, so far as I am individually concerned, I will never consent to have it dismembered by those parties who have taken no part in its formation.

I further enter my firm though respectful protest against any attempt to prevent us from increasing our collection as heretofore. We, as architects, have continual opportunities of adding specimens to our collection, and I protest against any attempt to deprive us of the power of doing so. I have no objection in all these matters to mutual and friendly cooperation, but, so far as my individual voice goes, I will never consent to abdicate our powers of adding to our store, so long as we exist as a Committee, and continue possessors of the Collection. It is our best and our dearest privilege, and it will be treason to our cause to relinquish it.

(To be continued.)

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary general meeting of this body was held at the rooms, Conduit Street, Regent Street, on Monday evening; WILLIAM TITE, Esq., M.P., F.R.S., the President, in the chair.

Professor DONALDSON introduced to the Chairman as visitors:—Baron de Bode, engineer, Paris; Monsieur Trélat, architect, Professor of Architecture, Arts et Metiers, Paris; and Monsieur Stehlin, architect, Basle.

Several donations were announced, including a number of books presented by Mr. GEORGE R. BURNELL, C.E., to fill up vacancies in the library. Thanks to the donors were returned.

The CHAIRMAN invited the Fellows present, who had not already done so, to sign a memorial to the Government in favour of their providing funds for the restoration of the Chapter House of Westminster Abbey. The Dean of Westminster had acted nobly in this matter, in calling public attention to the subject, for it was impossible for the church funds to restore that magnificent building. The chapter house had been, since the reign of

Charles I., in the possession of the Government for the keeping of records. It was a remarkably curious and extraordinary building, which had been decorated in a most remarkable way.

Architectural Drawings at Windsor Castle.—Mr. ARTHUR ASHPITEL, having been called upon by the chairman, said: A short time before the fatal illness which deprived the architectural and artistic world of one who had devoted the best part of his study and energy to cultivate and foster their pursuits, that great personage had occasion to direct some very important alterations in the Royal Library at Windsor. During his researches there he discovered some old Italian architectural MSS. bearing the name of Muzio Oddi, of Urbino. He was much interested by the bold, original, and in some degree quaint nature of some of the drawings, and the extent of the knowledge and pursuits of the author. There were rough designs for large churches and palaces, mixed with sketches for details of the smallest matters; and with them were plans of battles and sieges, projects for fortifications of vast extent, and with them minute details, comprehending even the method of raising a drawbridge. The writing is in old Italian, and very difficult both to decipher and to translate. As other volumes now from time to time come to light, evidently by various architects, and all inscribed in the same language, and as many long days' reading in the libraries of Italy, while in search of materials for the restoration of the remains of old Rome, had made me, in some degree, familiar both with the character and phrases of the MSS. of the time, I was requested to examine them, and was able to identify and explain the greater part of the subjects. The research was of course suspended and delayed by the melancholy death of His Royal Highness, but ultimately this was the result:—No less than 32 bound volumes, mostly of very large size, were discovered, besides six large portfolios of drawings, which probably were intended at one time to have been bound. The earliest date I could discover written in them was 1563, and the latest 1773, but many of the drawings are probably older. Some of these volumes contain the arms of the Albani family, and as they are surmounted by the cardinal's hat, it is probable they came from the library of some ecclesiastical dignitary of that family. Some have the arms of the celebrated Consul Smith (as he is generally called), a gentleman who occupied a distinguished diplomatic situation in Italy for a long time, and who is favourably known among artists as a collector of very refined taste, and better known among the lovers of old books as the editor of the curious *fac simile* of a very early and celebrated edition of Boccaccio. Some of them contain reports, directed to Pope Clement XI., who was one of the Albani. Whether he bequeathed them to his family, or in what way they got to England, is matter of conjecture. The tradition is that Consul Smith had an unlimited commission from George III. to purchase for the royal library. Suffice it to say they commenced before the period of the completion of the chapel, as we should call it, but, as Italians say, the tribune of St. Peter's, and proceed, giving examples of some of the finest modern edifices in Rome, to the decadence of the art of architecture in Italy, a range of more than 200 years. Among the objects of which we have copious detail drawings are those of the completion of St. Peter's and building the sacristy, the alterations of the basilican churches of the Lateran, St. Sebastian, and St. Maria in Trastevere, which were required by a change of ceremonies at the period of the Papal benedictions of the Pope; a great number of new churches, among which San Ignazio, Spirito Santo, San Pietro in Montorio, works connected with Santa Maria dei Angeli, and many others; among the villas are the Giulia, Medici, Albani, Riari, Madama, Panfil, and the banquet-house of Cardinal Farnese; among the public buildings, the Curia Nuova, the Propaganda, and many of the buildings on the Quirinal; of theatres, the Aliberti, Tordenone, that at Parma so well known; the noble flight of stairs or salita of the Trinita ai Monti, and the fine façade of the fountain of Trevi. Among the objects of antiquity are drawings of the Columbaria about Rome, and of all the temples and basilicas in the state they were in at the time. Valuable as those are which represent objects still in existence, there are many which have a twofold value to the Roman antiquary, because they have since wholly or in part disappeared. Among them are the temple of Minerva Medici, that in the Forum of Nerva, the Sættizonium of Septimius Severus, the villas of Hadrian and of Pliny, and a great number of relics formerly in the Appian Way. There are also rich treasures in beautiful copies of friezes, arabesques, stuccoes, and mosaics, taken from the remains of antiquity, many of which have faded since exposed to the light, and some, perhaps, have perished. But the architects have not confined themselves simply to building operations, they have condescended to design the minute adjuncts to decorations required. We find among those volumes drawings for altars, tents, tombs, funeral decorations, chimney pieces, fountains, and even lamps and thuribles. Nor have they been content with the artistic portion of their profession; we find amongst these volumes evidences of high scientific knowledge; we have drawings of harbours, with the method of repairing breaches of the sea and constructing breakwaters, on a less scale, it is true, but as ably planned as that at Plymouth, and a more wonderful work, if we consider they could not compel the services of that gigantic helot steam in those days. There are also designs for prisons and houses of correction quite on the principle of our system of inspection, plans for complete drainage of towns, and a number of others, which show that architecture and engineering were at that time almost synonymous arts. Not only so, but military engineering exhibits itself largely in these volumes. There are plans of the sieges of Tortosa, Monferrat, Fuentes, Antibes; a number of military plans of various parts of the country; projects for fortifying the city of Lneca, which were carried out and now exist; curious designs for towers of defence, mounting one large gun, like our Martello tower; designs for large granaries; powder manufactories, with draw-

ings of the machinery; designs for drawbridges; in short, specimens of almost all the useful and ornamental arts of the day may be found in those volumes. The names attached to the drawings, which in most cases, and perhaps in all, are autographs, are indeed deserving of deep respect, second only to those of the great men of the age which immediately preceded them, as Da Vinci, Raffaele, and Michael Angelo. We find the names or works of Julio Romano, Domenichino, Bramante, San Gallo, Pirro Ligorio, Bartoli, Borromini, Oddi, the Fontanas, &c. And one precious volume is filled with original sketches, chiefly from Venice, by the famous Canaletti. When we consider the versatility of talent displayed by the Italian architects, who did not disdain small things in art because they were capable of great things, nor the useful because they were masters of the ornamental, it is not to be wondered at they held the high rank in society they did. The Pope, the Emperor, the Grand Duke, all welcomed the architect as not only a lofty, but a useful spirit in the state, and he trod in Courts the equal of the leading minds of the day in other intellectual pursuits—the diplomatist, the jurist, or the great inquirers into the physical or metaphysical worlds. Whether the system urged upon us by some, in the present day, of despising science and learning; and narrowing the mind to one branch alone, or rather to a sub-branch of a branch of architecture, tends to raise the profession in the eyes of the public, or whether it has not already tended to its depreciation in some degree, it is now our purpose to inquire. By gracious permission of the Queen we have before us four volumes out of the collection at Windsor, on which I beg to venture a few remarks. They are not specimens of the most finished and most highly-coloured drawings there, but exhibit rather the architect in his studio, dashing off with a common pen the ideas arising in his mind, and the greater part had probably never been meant to meet the public eye. The most of them, however, are evidently to scale, and the localities and the subjects, and the purpose-like manner in which they are executed, will, I am sure, be worthy our attention. The first to which I shall direct your attention has a melancholy interest attached to it: for it was the first discovered by the late Prince Consort. The name of its author is not one of those familiar to every ear, though in foreign biographies it holds a respected place. It may be convenient, however, to state a few facts as to his character before proceeding to the examination of the contents of the two volumes, which I will endeavour to do as briefly as possible. Muzio Oddi, whose name stands conspicuous on the title-page, was born at Urbino, in 1569. His father was an officer in the troops of Francesco di Medici. At an early period he gave promise of spirit and talent, and was placed under the tuition of the celebrated Barocci, from whom he learned drawing. This painter was also a native of Urbino, and one of the few that opposed the so-called eclectic school of the day, preferring rather that of Correggio, Raffaele, and their predecessors. He soon discovered in the lad a talent for mathematics and the constructive arts, and advised him to give them his particular attention. His biographers say that Oddi made rapid progress in these studies, when, like our late valued and lamented fellow member, the celebrated Cavaliere Canina, he entered the army, and became *Chf d'Artillerie*. He seems to have distinguished himself so much, and to have won the approbation of the Grand Duke to such a degree, as to be admitted member of his Privy Council, when suddenly a storm broke over his head. He was charged by the Grand Duke with having betrayed the secrets of the Privy Council, and that to his wife the Grand Duchess, and he was immediately consigned to the dungeons of Pesaro. The charge seems strange; and there are hints that, after all, Italian jealousy was at the bottom of the accusation. However this may be, it seems clear that the unhappy young man was subjected to a strict and cruel confinement for nine long years. He was deprived of the use of pen, ink, and paper; but his biographers say he got over these defects by making pens out of pieces of reed, and ink from charcoal and the soot of the chimney, and that he fabricated a sort of size from the relics of his food, with which he prepared the commonest sorts of paper, so that they could take the ink. Specimens of these drawings are still preserved at Urbino, and shown as curiosities; and I have very little doubt that some of the rougher sketches now on the table before us were done in the same manner. In these pursuits, and in the study of mathematics, the time passed away, and he was at length liberated, but on condition of his leaving his native place for ever. He proceeded at once to Milan, where he was elected to the Professorial Chair of Mathematics, and probably practised also as an architect; for we have in the volume before us some designs which appear to have been carried out in the Cathedral there. From thence we read that he was invited to Lucca, to fortify that city; it was in the year 1626, when the struggle was going on for the vacant Dukedom of Mantua, and Italy was ravaged alternately by the arms of France and Spain. The drawings of those fortifications are before us; and we are told that they gave such satisfaction to the authorities that he was presented with a medal of honour. From the plans of sieges and other military operations, it is probable he was present at some of the battles which ended with the sack of Mantua. He seems, however, to have resided at Lucca; for his biographers state he was invited from thence by Cardinal Trivulzio to return to Milan. This invitation he declined, preferring to proceed to Loreto, where he seems to have designed the sacristy for the famous church there, and to have executed works at Ancona. Shortly afterwards he seems to have had permission to return to his native town, Urbino, where he died at the age of 70 years. His writings are still extant, and they are purely mathematical. One is a description and the direction for the use of an instrument which he calls the *polymetral compass*, a delineation of which it is supposed is in one of the volumes before us. On the title to the book is neatly written "Original

Drawings from the hand of Muzio Oddi, of Urbino." It commences with a large number of sketches in a sort of ink and in red chalk. Some of these are very neatly finished, others are of the roughest description—in fact nothing but scratches, and as if done by a very imperfect light. They are in mere scraps of paper, and the probability is a good portion of them were done in the solitude of his dungeon, and with the imperfect materials I have described. Among them is a drawing of a curious instrument, composed of two limbs connected together by a graduated, circular arc, which seems to be fixed, and carrying another one graduated in like manner, which seems to be moveable. It is furnished with a plummet, and seems intended for taking angles or levels, and may be the *polymetral compass* alluded to by his biographers. (We shall give the remainder of Mr. Ashpitel's address in our next.)

CHURCH, CHAPEL, SCHOOL, AND OTHER BUILDINGS.

CHURCHES.

LAMBETH.—In the Kennington road, Lambeth, contiguous to Walcot place, a handsome district church is now being erected, and will shortly be completed. It is in the early decorated style, from the design of Mr. H. E. Coe, the architect, and will be dedicated to St. Philip. The chief material is Kentish rag stone, laid in the random style, which, together with the Bath stone dressings and the lofty spire, 140 feet high, with which it will be adorned, will, doubtless, produce a most picturesque effect. The entire details are being carried out by Messrs. Jackson and Shaw, of Earl street, Westminster, the builders. The whole cost of the building is to be not more than £6,000, while it provides 1,005 sittings (519 free). It is intended also to erect a parsonage, and a friend has offered £5,000 on condition that the latter, as well as the church, shall be built and an endowment of £200 a-year provided before Christmas, 1862.

OUNDE.—A petition for a faculty to restore Oundle church has failed: another effort, however, is to be made.

HYTHE.—The new window, the gift of Thomas Quested Finnis, Esq., has been placed in the east end of the chancel of the parish church, Hythe. The window consists of one centre light, 35 ft. by 4 ft. 6 in., and two side lights, 33 ft. by 3 ft. 6 in. each. In the centre are three medallions—the crucifixion, the resurrection, and the ascension—with geometrical work. In each of the side lights also is a medallion—one, the raising of Lazarus; the other, the raising of the daughter of Jairus—with geometrical works. Running the length of the window is the inscription, on glass:—"This window was presented by Alderman Thomas Quested Finnis, of this town, and Lord Mayor of London, to the memory of Ann Lydia, who departed this life on the 7th Nov., 1861." The work has been beautifully finished by Messrs. Chater and Son, of St. Dunstan's, Tower Street, London.

HIGHWORTH.—The parish church, which has been lately restored, was re-opened on the 6th inst. by the Bishop of the diocese. The whole building is very lofty, and, with the large windows, extremely well lighted. A new entrance gate from the road on the west has been erected, and a broad path, paved, formed to the west door in the tower. The ground around the church has been lowered, and new paths formed. Mr. Huggall was the architect, and Mr. Padley, the contractor.

STACKPOLE ELDER.—A memorial window to the late Earl of Cawdor, by Mr. A. O'Connor, has been placed in the church of Stackpole Elder, by the tenant-farmers and other inhabitants of the six parishes comprising his Lordship's estate in that part of Pembrokeshire.

ST. BARTHOLOMEW'S NEW CHURCH, NEAR SOUTHSEA.—In August last St. Bartholomew's Church was commenced, and it is now nearly completed, the portion built being the nave, chancel, and vestry, the cost of which, with the western gallery, is £2,500. The accommodation at present afforded is for 700 persons. There are three entrances to the church, the principal one being at the west-end, having a large porch, the others being on the north and south sides. On the south side of the building, under the chancel-arch, is a handsome octagonal pulpit upon standing columns with foliated caps. The chancel-arch is supported on two handsomely carved corbels; the altar-rails are of carved stone, the gas standards coming up through the piers. Fixed against the east wall of the chancel is an ornamental stone screen of excellent workmanship, designed to contain the Commandments, &c. The east window is a beautiful specimen of stained glass, designed and manufactured by Messrs. Chance, Brothers, of Birmingham. The lower portion of this window, which has been presented and erected in memory of the late John Warden, Esq., M.A., is composed of geometrical figures, exquisitely designed in harmonising colours, the upper portion consisting of a very beautiful representation of the Saviour's ascension. The roof is of open stained timber, varnished, as are also the whole of the sittings, which have been built on the most approved modern principle. The architects of the building are Messrs. Goodwin and Butcher, of London, and the builder, Mr. T. R. White, of Landport. The whole of the work has been carried out under the immediate superintendence of Mr. Goodwin. It is proposed to consecrate the church the latter end of this month, which ceremony will be performed by the Lord Bishop of the diocese.

ARDAMINE, IRELAND.—A new church, dedicated to St. John the Evangelist, has recently been consecrated at Ardamine, Ireland.

ISLIP CHURCH.—A fine window in stained glass has just been placed at the east end of this church, in memory of the late Dr. Buckland and his wife. It is the gift of their children, he having been several years rector of this parish. It consists of three main bays, surmounted by a bold compartment of six points, with other tracery. The design consists of the vine,

distributed over the whole surface of the window, so ingeniously intertwined as to form in its several interlacings the various panels which contain the subjects. The main panels in the chief bay contain the "Annunciation," "Crucifixion," and "Noli me tangere." The chief tracery light has the "Ascension of our Lord," the minor ones the "Pelican in her piety," and the "Holy Lamb," &c.; the other panels have angels, monograms, and other several subjects, mostly referring to the passion of our Lord; all these are enclosed by various and beautiful borderings. At the bottom of all runs the following inscription, "Memorial to William Buckland, D.D., Dean of Westminster, died Aug. 14th, 1856, and Mary, his wife, died Nov. 30th, 1857. By their children." Messrs. Warrington and Sons, of London, are the artists.

GLASGOW CATHEDRAL.—COMPLETION OF THE ROYAL WINDOW.—The long-expected painted glass for the east window is now erected. The splayed sills have been replaced, and the window frame is restored to its original form. The new window contains figures of the Evangelists—Matthew, Mark, Luke, and John—very noble figures, whose inspired and hopeful look is intended to contrast with the stern prophets of the transept window; the contrast between the old and new dispensations is thus typified, so far as it may be possible by the power of art. The upper part of the window is filled with a diaper of singular elegance, both of form and colour; we do not remember either in modern or old glass seeing a finer diaper or a border of greater beauty. The display of heraldry is magnificent—in the first place, to the left of the centre and of the spectator, but to the right in the window, are placed the arms of the Sovereign as Queen of the United Kingdom; to the right of the centre the royal arms of Scotland; close to the arms of Her Majesty are those of the lamented Prince Consort; whilst the arms of the heir to the throne are placed on the other side, surmounted by the badge of Wales, instead of the usual royal crest. The feathers make an admirable pendant to the crest of the Prince Consort. The entire array of royal arms, admirably designed and executed, has a rich and harmonious effect. There is no special inscription of dedication; but the funds were provided by Parliament, and it has been the wish of the Government to erect a window in entire harmony with those of private subscribers, and regulated in its design and execution, as well as in its subject, by the same conditions. The figures of the Evangelists in this fine work of art were designed by Johann Von Schrandolph, historical painter, Professor of the Royal Academy of Munich, Knight of the Order of Civil Merit of the Crown of Bavaria, Member of the Bavarian Order of Maximilian of Art and Science, and of the Order of St. Michael of Prussia. The ornament is from the designs of Maximilian Aimmiller, architect, Knight of the Order of St. Michael of Prussia, of the Order of the Red Eagle of the third class, and of the Order of Pius IX. The Chevalier Aimmiller is also an honorary member of the Royal Academy, Munich, and inspector of the Royal Establishment of Glass Painting.

ST. MARTIN'S CHURCH, LEICESTER.—About two years ago the intersection tower of this fine church was found to be in such a ruinous condition that the vicar and churchwardens resolved to have it taken down. It has now nearly been rebuilt, together with the north and south transepts. The new tower, which is 26 ft. square, is supported on four handsome arches 16 ft. wide by 32 ft. high in the clear (the old arches were about 12 ft. wide by 15 ft. high), which greatly improves the interior effect of the church. It is proposed to surmount the new tower with a lofty broach spire, but at present the committee have only funds sufficient to carry up the tower to the height of 108 ft. The works have been carried out by Messrs. Dove of Islington, from the designs and under the superintendence of Mr. Raphael Brandon, the architect, who directed the former restorations of this important and interesting church.

STAINED GLASS AT ST. PATRICK'S CATHEDRAL.—The *Dublin Builder* says: Messrs. Barff and Co. have been commissioned to fill in with stained glass the great south transept triplet window of this cathedral. The subject selected by Mr. Guinness, the donor, is "The Ascension of our Lord." A full-length figure of the Redeemer will occupy the upper part of the centre light, the Apostles, in groups, filling the lower portions of the three lights; and those prophets who especially prophesied the coming of our Saviour are represented as seated in glory in the upper parts of the two side lights, contemplating the fulfilment of their prophecies.

ST. GREGORY'S CHURCH, SUDBURY.—This church is to be restored and re-seated.

CHAPELS.

STOCKWELL.—On Wednesday week the foundation stone of a new chapel in the Studley Road, Stockwell, was laid with the usual ceremony by J. Corderoy, Esq. The site is most eligible, the purchase of which, together with the cost of the building, will be about £4,000, of which only about £2,500 has already been subscribed. The style of the edifice externally is Ionic, resembling Mr. Spurgeon's Tabernacle. The materials in front, including the pillars, are of stone. The architect is W. Jenkins, Esq., and the details are being carried out by Messrs. Chincock Brothers, of Wandsworth Road. When completed there will be seat accommodation for 1,100 persons.

METHODIST CHAPELS, SCHOOLS, &c.—New schools, costing £1,500, have been opened in connexion with the new chapel in Mornington Road, Southport. The foundation stones of new chapels have been laid at Merthyr Tydvil, Middlesborough, and Market Rasen; and of new schools at Exeter and Whitechurch, Salop; and new day schools have been opened at Crewe. The Middlesborough chapel is to cost £4,400, and to seat 900 persons with ease. It will be the second Wesleyan Chapel in the town. The Exeter

schools will cost £1,209, and accommodate from 350 to 400 children. The Whitechurch schools will cost £1,130. The Crewe schools have cost £1,316.

CHAPEL ASH, WOLVERHAMPTON.—Mr. Bidlake's plans have been accepted for the Wesleyan chapel about to be erected here. The design is for a building, chiefly of stone, in the Geometric style, with a tower and spire 100 feet high. There is a large window in front; and the lower part of the wall is broken by an arcade, one compartment of which contains a window lighting the vestibule. On each side there is a clerestory, supported in the interior by iron columns. Bricks are employed for some of the arches and bands; blue stone for the shafts of the doorway and arcade; and Bath stone for the cornice of the tower, window dressings, &c. The chapel is 81 feet long and 50 feet wide; and there are galleries at the end and on each side. It is to seat 900 people. There are three vestries at the back, with a yard, &c. The total cost of the building will exceed £3,000.

BUILDINGS.

REDCLIFFE.—An infirmary is about to be erected at Redcliffe, Oxfordshire. The mortuary is in course of removal; the foundations of the main buildings are begun. The shell of the building is likely to be completed this year, and then no doubt need be entertained that means for completing the interior will be found. The magnificent gift of a chapel, by Mr. Combe, waits only for the selection of a site.

TODMORDEN.—A new masonic hall has been opened at Todmorden. The building is a very handsome structure, in the Italian style of architecture, and has cost about £2,000.

NEW THEATRE, EDINBURGH.—Mr. Howard is busy in arranging for the building of his new Theatre in Nicholson Street, Edinburgh, on the ground on which the present circus now stands. It is calculated to contain from two to three thousand people.

KILMAINHAM GAOL.—The female side of Kilmainham Gaol is to be remodelled and put on the separate system, according to the designs of Mr. M'Curdy, which have just received the approval of the Lord-Lieutenant. The new wing recently added to this gaol by the same architect is perhaps the largest in Europe, and forms a new feature in prison architecture.

RACQUET COURT, TRINITY COLLEGE.—The long-talked-of racquet court is at length to be erected in the park of Trinity College, which announcement will no doubt be hailed with pleasure by the majority of the students of Alma Mater. It has been a great source of surprise that such an institution should have so long remained without this great essential to the physical development of the rising generation, who may there pursue their studies. Racquet playing must, in a great degree, tend to counteract the injurious effects of the sedentary and confined life to which the hard-working "honourman" must of necessity subject himself. For this reason alone—say nothing of having "within the walls" those means of recreation which may keep many a youth from the allurements of town-life—we consider this a step in the right direction. Mr. M'Curdy is the architect; Mr. J. Nolan, contractor.—*Dublin Builder*.

COLUMBA COLLEGE.—A new dormitory (early English) is to be erected at Columba College. Mr. M'Curdy, architect; Mr. Gahan, contractor.

GIFT OF A TOWN HALL TO DALBEATIE.—On the 13th inst., a new town-hall and reading room, erected by Wellwood Herries Maxwell, Esq., of Munches, was formally opened.

NEW PUBLIC HALL, DORKING.—A gentleman of this town has projected a new hall, and his agent has exhibited his plans to the public. It is proposed that the large hall shall be capable of holding about a thousand persons.

By the kind permission of the Dean of Westminster, and with the concurrence of Mr. G. Scott, arrangements have been made for a visit of the members of the Architectural Association to Westminster Abbey, on Saturday, the 28th instant. A prize is offered for the best written account of this visit.

GENERAL ITEMS.

THE HOLY SEPULCHRE, JERUSALEM.—The *Paris Patrie* says that both France and Russia reject the proposition of the Porte to participate in defraying the expenses of reconstructing the cupola of the church of the Holy Sepulchre at Jerusalem.

THE THAMES EMBANKMENT.—Monday, the Hon. Mr. Cowper in the chair, the case of the Duke of Norfolk, in connection with the Strand estate, comprehending Surrey, Norfolk, Howard, Arundel, and other streets, of which the Duke, who was represented by Mr. Hope Scott, Q.C., his guardian, is the owner, came under the consideration of the Railway Committee. The Strand estate has a frontage to the river on its south side of 540 ft. in length, and the Duke claims right of foreshore all along it under charter from Charles I. It is proposed to run a sewer, together with the embankment, and to make communications out of them by means of a side road, leaving an angular space 600 ft. long and 60 ft. wide between the embankment, the roadway, and the side road, the width of the latter to be 40 ft., and to communicate with the streets forming the Strand estate by continuations, the result of which as alleged would be to cut off entirely the water frontage of the estate, and to destroy, by the through traffic, the existing privacy of those streets. Under these circumstances, the committee were asked to give protective clauses to the effect that the land reclaimed should not be built on, but be vested in the owner of the estate, together with control over the traffic. The committee expressed a general approval of these requirements, and ordered clauses in accordance with them to be brought up,

as well as in the case of the Marquis of Salisbury, who sought similar protective provisions in connection with his property in Salisbury and Cecil Streets. The City of London Gas Company sought the insertion of clauses giving them the exclusive use of the foreshore between the embankment and their works at Whitefriars for their lighters, storage, and works. Mr. Gray, the chairman of the company, and Mr. Hawkesley, C.E., were examined in proof of the expediency of this, showing that the company's river frontage extended 330 ft. along the river, and that all the available space alongside was required for the manufacture of their gas for supplying the city, which last year amounted to 481,000,000 cubic feet, with 51,758 tons of coal carbonised. Mr. Burke having pointed out the provisions intended to be introduced into the Bill for furnishing the company with adequate facilities for their trade and manufacture, and showed that the embankment would be carried in front of their premises with open arches of 70 ft. span, the committee negatived the application, the parties reserving their opposition for committee of the House of Lords. On the application of Mr. Hepe Scott, on behalf of the Duke of Buccleuch and the Crown lessees, it was agreed that the correspondence between the Treasury and the Commissioners of Works should be produced and entered on the minutes, and the committee adjourned.

PARIS UNIVERSAL EXHIBITION.—It is announced that a permanent universal exhibition will be opened in Paris in the summer of 1863, under the patronage of the emperor. The building is to be on a grander scale than the London Exhibition, the dimensions being 1000 ft. long, with a central dome 345 ft. in height. One of the grand features is that foreign goods will be admitted for exhibition free of duty, with liberty to re-export them, or they may be sold on the spot, paying the duties levied under the new tariff. The great inducement held out to English manufacturers is that they will be enabled to exhibit their goods, and thereby check the large sale of spurious articles now going on in Paris. The capital of £600,000 has already been subscribed in France and Belgium. The building is in course of construction.

BRICK MACHINE.—This invention, patented by John J. Alvord, of Tecumseh, Mich., consists in a novel and improved clay-tempering device, rotary mould-wheel and screw-feeder, so constructed and arranged that the whole process of moulding and pressing bricks is performed by mechanism having a rotary motion, the working parts being so arranged as to admit of a quick movement without the liability of getting out of order or becoming deranged in any way.

THE PROJECTED CRYSTAL PALACE AT DUBLIN.—A company has been formed for the erection of a permanent Crystal Palace, the directors including forty of the most influential noblemen and gentlemen of the city, with the Duke of Leinster as chairman, and Mr. B. Lee Guinness as vice-chairman. The ground selected, about fifteen acres, is to be turned into a winter garden, and in its centre the palace is to be put up, containing a concert hall, along with galleries for the exhibition of work of art and art-manufacture.

MEMORIAL TO A LADY.—A memorial has recently been erected in St. Barnabas's Church, Erdington, to the late Miss E. Harrison, of that place. It consists of the figure of an angel, five feet eight inches high, executed in Caen stone, bearing a brass shield, upon which is the following inscription:—"The poor of Erdington erected this tablet as a memorial of their gratitude to Elizabeth Harrison, who died March 20, 1860." The carver of the figure is Mr. S. P. Wood, of Lichfield; and the brass the work of Mr. Thomas Brawn, architectural metal worker, Birmingham.

A LADY SCULPTOR.—In the Great Exhibition (North Court, Central Division) is the statue of a large dog, sculptured by the lady of Henry Heathcote, Esq. (brother of Lord Aveland, of North Luffenham, Rutland), which has already attracted groups of admirers. The animal is represented as lying down, with its fore legs extended and its head erect, the pose altogether being very natural. It is the statue of a favourite living dog in Mrs. Heathcote's possession, and is a very spirited and highly successful production from the fair sculptor's atelier, which, we believe, was on the premises of Mr. Blashfield, of Stamford, amongst whose beautiful terra cotta goods the statue in question has found a locale in the exhibition.

THE DEMOLITION OF THE HOUSES OF THE LONDON POOR.—The *South London Journal* says:—"The construction of the Metropolitan Meat and Poultry Market will destroy 86 small houses, and displace 939 persons, and we are told that the Railway Company will furnish cheap railway travelling, morning and night, to Farringdon Street, for 1,000 working men. Now, this is rather better than saying there is room for them in the neighbourhood, but who will build dwellings for these thousand men in the vicinity of a station, where land is sure to be almost as valuable as in the metropolis? Moreover, the cheapest possible cost at which a working man can be conveyed to and from the place of his labour will make a serious inroad upon his income, and the necessity of taking his mid-day meal apart from his family will add another formidable item to his expenses. It appears to us that what is required in all cases is, the construction of houses adapted for the labouring classes, contiguous to the territory which these public improvements invade, and that this should be done, if other means fail, by legal enactment. In the case of new streets, the needful accommodation for the working people might be afforded without much difficulty, and we see no insurmountable obstacle to it in the making of a metropolitan line of railway. We learn with much satisfaction that the attention of the Metropolitan Board of Works has been called to the subject, in connection with the new street in Southwark. There seems to be no reason why that street, throughout its entire extent, should be bounded by only shops and first-class houses. Why should not cheap, yet neat and commodious dwellings, for artisans and operatives find a place there as well

as more costly abodes? Even if it should not be deemed desirable to erect such dwellings immediately in front, there are many small sites abutting thereon which might be made available for them, so that the worst evils of displacement may be avoided. We have no reason to doubt that the matter will be taken into the serious consideration of the Board, and we shall truly rejoice if in the end they see their way clear to provide for the lodgment of those who have been dispossessed of their homes by a great measure of public improvement, which the new street unquestionably is."

MONUMENT TO THE GROOM OF QUEEN VICTORIA.—Messrs. Osmond and Son, sculptors, of Salisbury, have just erected in Whippingham churchyard, Isle of Wight, a monument, consisting of a cross on three steps and circle, with the following inscription:—"To the memory of George Frederick Jones, born 1820, died 1862, groom to Queen Victoria, and the faithful attendant during 13 years of the Royal children, by whom this stone is erected, 1862."

DEPARTMENT OF SCIENCE AND ART.—The increase of students attending the schools of the Department of Science and Art during the last few years is worthy of record. In 1859 the numbers were 85,969 persons; in 1860, 88,461; in 1861, 91,741. The number (included in the above) under Science instruction in 1861 was 5,390, to whom 322 prizes were awarded; in 1860 the numbers were 3,158. The travelling museum has been visited, since the circulating system commenced, by 608,707 persons, and the localities have realised 15,690*l.* in fees, which they have retained in aid of local expenses. This excellent arrangement has enabled the inhabitants of thirty-four cities and towns in the three kingdoms to examine the splendid results of Art thus brought to their doors.

CARRICKFERGUS PIER, IRELAND.—The Municipal Commissioners of the port of Carrickfergus have applied for a provisional order for works for improving the accommodation for shipping, by the construction of a pier or quay, giving a depth of five to seven feet at low water; and also for forming a breakwater on the west side of the harbour. The Commissioners have also sought for power to levy rates. The cost of the new works was estimated at £6,000.

SHAKESPEARE'S HOUSE, STRATFORD-ON-AVON.—The works for restoring Shakespeare's house at Stratford-on-Avon, and converting the ground adjoining into a garden, which is intended to be open to the public, have been actively commenced, and it is expected that they will be completed in about a year.

THE UNDERGROUND RAILWAY.—In excavating the cutting opposite Ray Street, which is intended to connect the Clerkenwell tunnel with the station in Victoria Street, the workmen have uncovered the large vault which contains the remains that were removed some years back from the pauper burial-ground of Clerkenwell. This vault is of great depth, covered at the top with massive stone slabs, and ornamented with a large stone cross. The workmen have already removed the earth nearly to the level of the line, previous to pulling down the vault and removing the remains to some extramural place of sepulchre. A great number of labourers and artisans are employed on the site of the terminus in Victoria Street, and mounds of clay are being burnt ready for use in the foundations. The stations at King's Cross, Gower Street, and the rest of the works of the line, are in a state of great forwardness.

FALLING-IN OF THE FLEET SEWER.—Great excitement has prevailed in Ray Street and Saffron Hill, Clerkenwell, in consequence of a falling-in of a portion of the Fleet sewer at those spots. The first alarm was given on Sunday afternoon between the hours of two and three, when about twenty feet of the roadway fell in, the old sewer having given way. The cause of its breaking away is attributed to the late heavy rains; but it may be mentioned that some years back, near the same spot, another portion of the same sewer fell in. Mr. Superintendent Gernon and Inspector Brannan, of the G division, with a strong body of police, were at once in attendance, and the roadway was barricaded. On Monday morning it was found that between ten and twelve feet more of the sewer had given way, and the whole of the houses were flooded. The whole of the flour belonging to Mr. James Warkley, baker, of 29 Ray Street, is damaged. Mr. E. Richardson, the landlord of the Coach and Horses public-house, and other persons, have sustained great damage. The surveyor of the parish has been communicated with, and efforts have been made to prevent any further damage.

MOFFAT.—BUILDING.—Hopetoun Place, in Academy Road, is now finished, and adds greatly to the amenity of that part of the town. The houses are on the metropolitan scale for beauty, accommodation, and attention to all sanitary requirements. Havelock Crescent is opening up a communication between the Old and the New Well Roads; and another crescent, taking a similar curve, has lately had two houses begun; other feus are taken in the vicinity. Beech Grove is extending itself. The British Linen Company's Branch Bank is nearly finished, and is a handsome substantial building. The United Presbyterian Church is to be contracted for next week, we hear, and as we have seen the architect's designs, we know it will be a very elegant, commodious English-Gothic structure, and will greatly ornament the town.—*Correspondent of Scotsman.*

CHIPS.

THE aqueduct now in course of construction at Paris will be 4,034 metres in length.

In the House of Commons, on Thursday week, Sir G. Grey stated that a bill would be ready in a few days to provide for the construction of a second shaft in coal mines.

The *Mining and Scientific Press* of San Francisco says that about twelve

miles from Auckland a coal oil-bed has been discovered, from which large supplies can be derived for burning purposes.

A new bridge is to be built over the Willybrook, King's Cliffe.

A monument is about to be erected in the cemetery at Louth, and a memorial tablet in Walkergate Chapel, in the same town, by the members and friends of that place of worship, in memory of the late Rev. J. Kiddall.

At the Sheriff's Court of Surrey, the Rev. J. G. Wenham, a Roman Catholic priest, sought to recover the sum of £627 10s. from the Metropolitan Board of Works, as compensation for loss sustained by him in consequence of the Board requiring a building in Price's Street, Gravel Lane, Southwark, used as a Roman Catholic charity school, of which the plaintiff was manager, &c., for the purposes of the new street. The jury found for the plaintiff—damages, £350, which will, of course, carry costs against the Board.

One hundred thousand sacks of earth have been thrown into the cofferdam at Lynn, up to Wednesday afternoon. The leakage through the banks consequent upon the recent rise of water upon the land inundated, continues to increase daily.

The mason-builders have, it appears, generally accepted the terms upon which the masons consented to close their strike last week, and the men who remained out have been pretty well absorbed in the various yards and shops.

A new cemetery has just been opened at Weston, near Bath. The chapel on the ground, for the use of the members of the Church of England, is of the early pointed style, 25 ft. long by 15 ft. wide, has a small turret at the angles, surmounted by a spire. The Nonconformist chapel is of octagonal form, 20 ft. in diameter. Both edifices are lined with ashlar, and covered with high-pitched roofs. The work has been executed, under the superintendence of Messrs. Manners and Gill, architects, by the following tradesmen:—Mr. Greenman, carpenter; Mr. Birth, mason; Mr. Derrick, smith; and Mr. John Bussells, glazing and slating.

Messrs. Ormerod and Co., of St. George's Iron Works, Hulme are making a railway and road-bridge for spanning the Jumna, near Delhi. The bridge will consist of twelve arches, of 205 feet span each, and will be half a mile long. It is for the East India Railway, and is the design of Mr. A. M. Rendel, C.E.

A successful experiment in preserving wood for vessels has been made at Cherbourg. It consisted of subjecting the wood to a slight carbonisation with common inflammable coal-gas.

The sixth annual conversation of the St. Martin's School of Art will take place at eight o'clock, on Friday, the 27th instant.

A new street from Southwark to the Westminster Bridge Road will be opened in a fortnight.

It is said that the Exhibition about to be built at Paris, by Sir Joseph Paxton, is to be of such dimensions that the Crystal Palace at Sydenham will sink into insignificance if placed beside it.

The Lincoln Diocesan Architectural Society will hold its usual autumn meeting this year at Leicester. The gathering will commence on Wednesday, August 6. The Archaeological Association of Great Britain, the Leicester-shire Architectural and Archaeological Society, and the Northamptonshire Architectural Society will also unite their forces on the occasion. An interesting feature of the proceedings will be an excursion to Bosworth Field, one of the most famous scenes in English history.

The *Times* of Wednesday says, "We are informed that a very comprehensive plan is now before the Admiralty, showing what can and what cannot be done at Portsmouth in the way of enlarging the present dockyard, what are the existing difficulties, and how they may be best overcome. In considering this question, care must be taken not to overlook the value of the present establishment, and the importance of Spithead anchorage, whether as regards position, space, holding-ground, or security."

A new Corn Exchange is about to be built at Melrose, Scotland.

The first stone of the Leeds Grammar School Chapel will be laid by the Bishop of Ripon, on the 2nd of July.

A memorial fountain, to the late Dr. Fothergill, on account of his attachment to the temperance cause, and strenuous advocacy of all philanthropic objects, was inaugurated on Whit Tuesday, at Darlington. The design of the fountain is perhaps the most elegant to be found in the North of England, and the erection has cost a considerable amount of money.

A bill has been introduced into Parliament by Mr. McMahon, M.P., "to facilitate the obtaining of sites for places of worship."

The excavations at Rome, on the Palatine Mount, are attracting much attention. The vast accumulation of rubbish which covered the pavement of the building, supposed (but erroneously) to have been the Temple of Apollo, has been removed, and access is now free to the range of vaulted rooms below. Several objects of great artistic interest have been found in these rooms; among others, a pavement composed of rich marbles, columns with elaborately-carved capitals, and remarkable thyrsi.

Votes of £500 for the Royal Irish Academy, and £2,750 for the National Gallery of Ireland, have been agreed to by the Commons.

A telegram from Bordeaux of the 14th announces that the Hôtel de Ville of that city has been burnt down. The loss is immense. The archives have been destroyed. The museum is preserved. In Toulouse, also, the other day, an alarming fire broke out.

At St. Petersburg, large warehouses and shops, covering several acres, have been destroyed by a terrific fire, supposed to have been the work of incendiaries. The Apraxine and Stehbkukine markets and the Minister of the Interior's mansion were destroyed.

The contract for erecting a parsonage house for the vicar of the parish of Newport, on the left side of Hunny Hill, has been taken by Mr. Cole Jolliffe, builder, in Carisbrooke Road.

Correspondence.

GAS APPARATUS, INTERNATIONAL EXHIBITION.

To the Editor of the "BUILDING NEWS."

London, June 18.

SIR,—The mode of sealing the end of a coal gas retort by inserting it into a cistern of water, and which was described as objectionable in the "Building News," June 30th, when referring to "Wigram's patent vertical gas retort," can be easily obviated. Retaining the stand which supports the present water cistern, and replacing the latter with a cap of lime luting, this cap could be forced up over the end of the retort by a wedge or a screw having a bearing on the stand.

GEORGE WALCOTT, C.E.

TENDERS.

NEW AISLE, CHURCH OF THE HOLY FAMILY, SAFFRON HILL.—For a new aisle, Church of the Holy Family, Saffron Hill. Messrs. John Young and Son, architects. Quantities supplied by Mr. Shoppee.

COMPETITIONS AND CONTRACTS OPEN.

CHAPEL.—For the building of a new Wesleyan chapel, situate in the Humberstone Road, Leicester. Applications to be made to F. W. Ordish, Esq., Queniborough.

WORKHOUSE.—For the erection of two new wings to the Holbeach Union Workhouse. Tenders to be sent to E. G. Ayliff, Esq., Clerk to the Guardians, by Monday, the 23rd day of June.

RESTORATION OF CHURCH.—For the restoration of King's Cliff Church. Plans and specifications may be seen at the office of Mr. Edward Browning, architect, Stamford. Sealed tenders to be sent to the churchwardens on the 10th July.

SUPPLY OF GRANITE.—For the supply of about 500 tons of Guernsey granite lumps for breaking. To be delivered in the stone-yard of the workhouse, Poplar, free of all charges. The contractor will be required to enter into a written agreement for the due performance thereof. Tenders to be sent to the Guardians of the Poplar Union, by Tuesday, the 24th day of June.

GRANITE PAVEMENT, NORWICH.—For squaring and relaying granite pavement on the Gentleman's Walk, Norwich. A specification may be seen at the Surveyor's Office, 24 Castle Meadow, where every information may be obtained. Tenders to be sent to Mr. H. B. Miller, Clerk to the Board of Health, on or before the 30th of June.

CHURCH RESTORATION.—For restoring the parish church of Eling, Hampshire. Drawings have been prepared by Benjamin Ferrey, Esq., 1 Trinity Place, Charing Cross, London, to whom, in the first instance, all applications, with references, must be made. The architect does not bind himself to reply to all applicants; but the quantities have been prepared, and will be forwarded to those whose references are satisfactory, and they will be informed when the drawings can be seen at the church. Tenders to be sent to the Vicar of Eling, on the 30th of June.

IRONWORK.—The Garston and Liverpool Railway Committee are prepared to receive tenders for the supply and erection of columns, wrought-iron beams, iron roofing, and other ironwork, at their goods' station at Liverpool. Plans, sections, drawings, and forms of contract may be seen on or after the 13th day of June, at the office of W. M. Brydson, Esq., C.E., 8 Whitehall Place, Westminster, London, from whom specifications (price 10s. 6d. each), and any other information may be obtained. Sealed tenders, marked "Tenders for Ironwork," must be in the hands of Mr. Edward Ross, Secretary to the Committee, at the offices of the Committee, London Road Station, Manchester, not later than noon on Tuesday, the 8th of July next.

STATION BUILDINGS.—The Garston and Liverpool Railway Committee are prepared to receive tenders for the construction of their goods' station and buildings at Liverpool. Plans, sections, drawings, and forms of contract may be seen on or after the 13th day of June, at the office of W. M. Brydson, Esq., C.E., 8 Whitehall Place, Westminster, London, from whom specifications (price 10s. 6d. each) and any other information may be obtained. Sealed tenders, marked "Tenders for Works," must be in the hands of Mr. Edward Ross, Secretary to the Committee, at the offices of the Committee, London Road Station, Manchester, not later than noon on Tuesday, the 8th of July next.

CAST-IRON PIPES.—The Water Committee of the Council of the Borough of Liverpool, are prepared to receive tenders for the supply of 200 tons of cast-iron pipes, three inches in diameter, with bent and turned joints, and coated with "Smith's Patent Coating." Copies of specification, giving full particulars as to the terms and conditions of the contract, may be had on application at the Water Office, 58 Hotham Street, Liverpool. Sealed tenders, endorsed, "Tenders for the Supply of Cast-iron Pipes," and addressed to the Chairman of the Water Committee of the Corporation of Liverpool, to be forwarded to the Waterworks Office, Hotham Street, on or before Thursday, the 26th day of June.

WORKHOUSE.—The Guardians of the Poor of the Birkenhead Union, in the county of Chester, having further considered and re-arranged the plans and specifications for the erection and completion of the new Union Workhouse, to be built at Higher Tranmere, in the said county, are now in a position to receive tenders for the same. Separate and distinct tenders will be required for the several portions of the building, as follows, namely: 1st. For the erection of the north wing of the main building, including the dining-hall, centre building, or master's apartments, board-room, &c., with out-offices in the yard, tank, &c., but not including the completion of the cellage under this part of the building. 2nd. For the erection of the south wing of the main building. 3rd. For the erection and completion of the receiving and vagrant wards. 4th. For the completion of the cellage under the main building. It is the intention of the guardians to erect only the first portion or north wing of the main building, as specified above, before the month of April next. The second, third, and fourth portions of the building, to be constructed and completed as soon afterwards as the guardians may determine. The drawings and specifications may be seen, and further information obtained, at the office of Mr. Thomas Layland, architect, 20 Castle Street, Liverpool. Sealed tenders to be delivered or sent to him at the office of the Clerk to the Guardians, 60 Lord Street, Birkenhead, on or before Saturday, the 5th day of July next. Security required.

NEW TOLL-HOUSE.—To be let, the building of a new toll-house, on Gilesgate Moor, Durham. Plans and specifications may be seen on application to the collector, at the present house; and tenders will be received up to the 27th instant, by Edward N. Grace, Surveyor, Broomfield, Newcastle-on-Tyne.

MALT STORES, STABLING, &c.—For the erection of certain malt and other stores, stabling, &c., for Messrs. Pike, Spicer, and Co. Plans and specifications can be seen at the office of Mr. Henry P. Foster, architect, 128 High Street, Portsmouth, and obtain all other information. Tenders to be delivered to him not later than the 26th of June.

WHITWASHING, COLOURING, &c.—For the whitewashing, colouring, and pointing the Workhouse of Stoke-upon-Trent. Tenders, specifying the work proposed to be done, to be sent to the Clerk of the Guardians, Stoke-upon-Trent, on or before ten o'clock in the morning of the 25th inst. The specification of the work required may be seen on application to the Master of the Workhouse.

POLICE STATIONS.—For the erection and completion of a police station at the Felling, near Gateshead, and of another police station in the village of Brandon, near to the city of Durham, severally including a dwelling-house, cells and out-buildings. The plans, sections, specifications, and conditions may be inspected and perused at the office of William Crozier, Esq., C.E., the county architect, in the County Courts, Durham, on and after Tuesday, the 10th June inst.; to whom tenders (sealed and endorsed "Tender for Felling Police Station," or "Tender for Brandon Police Station," as the case may be) are desired to be delivered or sent, on or before Friday the 20th inst.

REPAIRING BRIDGES.—For the maintaining and keeping in repair, during the term of four years, commencing from the 13th May last, the roadways of the following bridges in the county of Durham—viz., Stone Bridge, Langley Bridge, Branepeth Bridge, Crook Bridge, Eel's Beck Bridge, Bradley Bridge, Nickyack Bridge, Gildon's Bridge, and Spennymoor Bridge. Further information may be had on application to William Crozier, Esq., C.E., Bridge Surveyor (at his office in the County Courts, Durham), to whom tenders (sealed and endorsed "Bridge Tender,") are requested to be sent, or delivered, on or before Friday, the 20th June inst.

ENLARGEMENT AND RESTORATION OF CHURCH.—For the enlargement and restoration of the parish church of Chew Stoke, Somerset, seven miles from Bristol. The plans and specifications can be seen upon application to the Rev. W. P. Waite, at the Rectory Hall, on and after Monday, June 9th. Estimates to be forwarded on or before Monday the 23rd of June, to John Norton, architect, London, 24 Old Bond Street, W.

BAPTIST CHAPEL.—For the erection of a new Baptist chapel, schools, &c., on the site of two houses, Stowhill, Newport, Mon. Drawings and specifications may be seen, and copies of the quantities obtained, on applying to the architects, Messrs. W. G. Habershon and Pite, 58 Bloomsbury Square, London; Park Square, Newport; and Belvedere, Tredegarville, Cardiff.

EXETER CITY GAOL.—The town council of Exeter are desirous to be informed if the present city gaol and house of correction can be made available so as to satisfy the requirements of the law, as to the construction of gaols and houses of correction; and they invite architects to ascertain if it is practicable that the present city gaol and house of correction can be so altered. They offer a premium of £30 for the plan of alterations which shall be considered the best, and if such plan be carried into effect the architect producing it will be employed to superintend the execution of the work at the usual commission, but in that event his premium is to merge in his commission. A premium of £20 will be given for the second best plan. The gaol and house of correction may be examined upon application to the gaoler, and further particulars obtained from Mr. G. W. Cumming, Post Office Chambers, Surveyor to the Council, or to Mr. Gidley, the Town Clerk, 15 Bedford Circus, Exeter, to whom each plan, with a statement of the probable cost of carrying it into effect, is to be sent before the second Monday in August. Plans of the present gaol, with sections of the main part of the building and across one of the wards, may be had of the Surveyor to the Council, on and after the 27th instant.

WORKHOUSE.—For the erection and completion of the new workhouse, to be built in the parish of St. Clement, Oxford. The plans, specifications, conditions, and form of tender may be seen at the workhouse on and after Monday, the 8th of June, and further information obtained of the architect, Mr. William Fisher, Headington Hill, near Oxford. Sealed tenders to be sent addressed to Dr. Adams, the Chairman of the Board, St. John's College, endorsed "Tender for Workhouse," on or before Wednesday, the 2nd day of July next, accompanied by the names of two responsible persons, who will join the contractor in the usual bond for the due performance of the contract.

WEST BRIGHTON CRESCENT, PORTOBELLO, N.B.—To set with curbstones, causeway the water channels, horse the footpath, and macadamise the carriageway, of West Brighton Crescent, Portobello. Furnishing all materials, all agreeable to a plan and specification which will be shown to intending contractors by Andrew Bell, Surveyor, any day previous to the 23rd current, on or before which day all offers must be lodged with the said Andrew Bell, at his Office, Council Chambers, Edinburgh, marked "Tender for West Brighton Crescent." The proprietors do not bind themselves to accept the lowest or any tender.

BRIDWELL.—For building a bridewell in the town of Newport, according to plans and specifications to be seen at the present Bridewell in Newport. The contractor will be required to give sufficient security, by recognizance in double the amount of the sum contracted to be paid for such work, to be approved by the said committee, for the due performance thereof. Sealed tenders to be addressed to the Chairman of the Commissioners, Richard E. Phillips, Esq., Mount Rivers, Newport, Tipperary, on or before the 20th instant.

EXTERNAL PAINTING OF CHURCHES.—For the external painting of the churches in the following lots or sections. Each tender must include one complete lot, and the sum for each church must be stated separately. Lot 1: Annadown, Arvon, Athenry, Clifden, Dunmore, Errisannon, Headford, Kileonla, Kilkerrin, Killeen, Monivea, Moylagh, Moyrus, St. Nicholas (Galway), Oranmore (Roundstone), Oughterard, Selnarra, Spiddall, Tuam; county Galway. Lot 2: Achill, Aasleagh, Ballinacolia, Ballinrobe, Ballyhenry, Ballyvogue, Burrischoole, Castletown, Cong, Crossboyne, Drum Belcarra, Killeconan, Kilmna, Knapphale, Mayo, Ross, St. Thomas (Achill), Furlough, Westport (Aughavale), Ayle, Louisburgh; county Mayo. Specifications to be seen in the hands of the resident ministers of the parishes. Each proposal to be forwarded sealed, prepaid, and addressed thus: "Proposals for the Church of . . . The Ecclesiastical Commissioners for Ireland, No. 24 Upper Merion Street, Dublin."

WARDS TO INFIRMARY OF UNION.—The Edmonton Board of Guardians will be prepared, at a meeting to be held at the Union Workhouse at Edmonton, on Wednesday, the 2nd of July next, to receive tenders for the erection of fever wards, and for making certain additions to the infirmary, at the union workhouse aforesaid. Sealed tenders, endorsed "To the Building Committee, Edmonton Union," must be delivered at the office of W. Pulley, Clerk to the Guardians, at Edmonton, on or before the 1st July next. The plans and specification may be seen, and all information obtained, at the offices of Mr. T. E. Knightley, architect, 25 Cannon Street, City.

FARM BUILDINGS.—For the erection of a set of new farm buildings, and making additions to out-houses, at the Moat Farm, Igham, Kent. May inspect the plans and specifications at the office of Messrs. Charlton and Son, surveyors, Tonbridge, on and after Monday, the 16th inst., where sealed tenders, endorsed "Tender for Farm Buildings, &c., Moat Farm," are to be delivered on or before Wednesday, the 25th inst. These works will be carried out subject to the approval of the Surveyor to the Inclosure Commissioners for England and Wales. Payment will be made when finished and certified by the said Surveyor.

DWELLING HOUSE AND OFFICES.—For building a dwelling house and offices on the farm of Corse, on the estate of Craig, in the parish of Balmacellain, belonging to James Caruthers, Esq. The plans and specifications may be seen in the hands of Mr. Huddleston, the tenant, on and after Friday, the 13th current, and offers will be received by the proprietor until the 23rd.

HOP MARKET, WORCESTER.—For raising the roofs of the north and east sides of the Hop Market Warehouse, adjoining the Hop Market Hotel, Worcester, the drawings and specifications of which may be inspected at the office of the architect, Mr. Rowe, 17 Foregate Street. Tenders under seal, and properly endorsed, must be delivered at Mr. C. Pidcock's offices, Foregate Street, on or before Saturday, the 28th instant.

IMPROVING CITY HALL.—Committee No. 3 of the Municipal Council invite architects to furnish Plans for improving the ascending steps and entrance to the City Hall, from Cork Hill, Dublin, and offer a premium of £20 for the plan which may be approved by the council, such plan to be the property of the corporation. Each plan to be marked with a private mark, and delivered with a sealed letter, containing name of architect and private mark, at the office of the Town Clerk, before Friday the 4th day of July 1862.

REPAIRING, RESEATING, AND RESTORING CHURCH.—For repairing, reseating, and restoring the parish church of Bicester, Oxfordshire. Plans and specifications may be seen on or after Thursday, June 12, at the office of C. N. Beazley, Esq., 44 Upper Gower Street, London; or at the house of Mr. Charles Shillingford, Churchwarden, Bicester. Sealed tenders, according to the form supplied, to be sent to the Rev. J. W. Watts, the Vicarage, Bicester, on or before June 26th. Quantities not supplied.

SEWERS.—For laying down, constructing, and completely finishing certain intended brick sewers, in "The Frome Intersecting Sewer District," within their district, about 5,520 yards in length. Persons wishing to contract for the same are requested to forward through the post, on or before Thursday, the 3rd day of July next, by ten o'clock in the forenoon, sealed tenders, addressed to the Committee of the Local Board of Health, 15 Prince Street, Bristol, and endorsed "Tender for Sewers." Any tender not sent through the post will be rejected. The plans and specifications of the works to be done may be seen at the offices of the Local Board of Health; and any further information may be obtained, either on

personal application, or by letter, pre-paid, addressed to the surveyor, Mr. Frederick Asmead, C.E. The party contracting will be required to give sufficient security, to be approved by the Local Board of Health, for the due performance of the contract.

OAK.—Persons desirous of tendering for a quantity of old oak, &c., of finest quality, from the ancient palace of Charles II. at Newmarket, may obtain particulars of Messrs. W. G. Habershon and Pite, architects, 38 Bloomsbury Square, London; or of Mr. John Hassell, Newmarket.

VILLAS AND COTTAGES.—For the erection of a pair of semi-detached villas and six cottages, at Bromley, in the county of Kent; can see the plans at the office of Mr. John Wimbale, architect, Wallbrook, where tenders, endorsed, are to be delivered on or before two P.M. of Thursday, the 26th instant.

CHURCH RESTORATION.—For the re-roofing and the performance of other works and restorations at the Church of St. Peter and Paul, Ospringe, near Faversham, Kent; may inspect the drawings and specification, and obtain further information, on application at the Vicarage, Ospringe, or at the office of Mr. E. L. Blackburne, architect, on and after Monday, the 23rd June inst. The tenders to be addressed and delivered, sealed up and endorsed, to the Churchwardens at Ospringe, on Monday, the 30th June.

HOUSES AND VILLAS.—For the erection of five houses, with retail shops, and four semi-detached villas at Erdington, near Birmingham, can see the drawings and specification at the office of Mr. J. R. Botham, architect, Birmingham; on and after Monday next. Tenders to be delivered on or before Wednesday, the 25th instant. The lowest or any tender will not necessarily be accepted.

BREAKWATER.—The Isle of Man Harbour Commissioners are prepared to receive tenders for the construction of a breakwater, 694 feet in length or thereby, at the Harbour of Ramsey. Plans, sections, specifications and conditions of the work may be seen, on and after the 16th inst., at the offices of the engineer, James Abernethy, Esq., M.I.C.E., 2 Delahay Street, Westminster. Sealed tenders, endorsed "Tenders for Breakwater," to be delivered to the Receiver-General, Richard Quirk, Esq., Douglas, Isle of Man, on or before the 5th day of July next.

BREAKWATER.—The Isle of Man Harbour Commissioners are prepared to receive tenders for the construction of a breakwater, 300 feet in length or thereby, at the Harbour of Peel. Plans, sections, specifications and conditions of the work may be seen, on and after the 16th inst., at the offices of the engineer, James Abernethy, Esq., M.I.C.E., 2 Delahay Street, Westminster. Sealed tenders, endorsed "Tenders for Breakwater," to be delivered to the Receiver-General, Richard Quirk, Esq., Douglas, on or before the 5th day of July next.

ABRIDGED SPECIFICATIONS OF PATENTS FOR INVENTIONS.

From the "MECHANICS' MAGAZINE," June 13.

2911. G. WILLIAM. Improvements in the manufacture or production of plate glass. Dated Nov. 20, 1861. Here the inventor proposes to rob, smooth, or flatten the upper surface of the newly-cast plate by passing to and fro over the same suitable rubber composed of a bar of wood, metal, or other suitable material, a long handle being fitted to such rubber for the purpose of facilitating the working or the operating of the same by the attendant workmen. *Patent abandoned.*

2915. J. C. CROFT. An improved mode of fastening doors, and for other similar purposes. Dated Nov. 20, 1861. This consists in constructing a fastening for doors, drawers, windows, and other like purposes, in the following manner:—A segmental or straight bolt is worked by, or if preferred, fixed to the handle, on turning which the bolt is made to protrude, and enter a groove or other similar provision made in the door jamb; one or more catches or tumblers fall by this movement, and prevent the return of the bolt; therefore, to unlock, it is necessary not only to lift the tumblers or catches, but at the same time to turn the handle. The patentee also makes a key-way in the lock which turns with the key, so that on any attempt being made to introduce a pick the key-way closes itself, and leaves but a very small passage to introduce anything further. *Patent completed.*

2916. W. P. BAYLIS. Improvements applicable to buildings, in order to facilitate the extinguishing of any conflagration which may happen therein. Dated Nov. 20, 1861. This consists in constructing buildings with an aperture, or with apertures, at the upper part of each apartment, the said apertures being in communication with tubes or channels opening into the chimney, or into the external atmosphere. Hence, if a fire takes place in the building, it will only be necessary to close the apartment and the smoke and fire will vent by the said apertures. The invention also consists in placing a cistern or receptacle at the upper part of the building, from which pipes descend which reach from the said cistern to the basement of the building, and may form supporting columns or pillars to it. Suitable branch pipes and valves are employed for conveying the water into any apartment where fire may occur. *Patent completed.*

2935. F. FRYTON and W. F. BATHO. Improvements in laths for supporting bedding and cushions in beds, couches, sofas, and seats. Dated Nov. 22, 1861. This invention consists in constructing elliptical laths, each separate lath being composed of two strips of metal united or brought together at their two ends and bowed towards the centre; between the two strips the patentees fix hoops of steel, volute or other metal spring or springs, to constitute spring laths for supporting bedding, cushions, and seats. *Patent completed.*

2949. E. A. ROWVIERE. An improved pump. Dated Nov. 23, 1861. This consists in the use of two pistons of different diameter, which are firmly secured to each other and work together in a pump barrel composed of two barrels of portions of different diameters, so that, as the pistons move or travel in their respective barrels, the capacity of the space compressed between them—that is to say, the space or portion of the pump bounded by the pistons, and the sides of the pump barrels, shall be continually undergoing variation, being either increased or reduced according to the directions in which the pistons travel—that is to say, when the direction of the piston's motion is such that the larger piston is moving towards the smaller barrel, and the smaller piston is receding from the larger barrel, the capacity of the said space is contracted or reduced; and when the pistons move in the reverse direction, the capacity of the said space is increased or enlarged, by which the forcing and suction of the water liquid is effected. *Patent completed.*

2952. J. B. HILLARD and L. G. POUPET. An improved process for hardening stones and plaster of Paris, and making them impervious to water. Dated Nov. 25, 1861. The composition which the patentees prefer for their indurating liquid is composed of the following ingredients in certain proportions:—Borax, white lead, sulphur of alumina, acetate of lead, sulphate of zinc, silicate of soda or potash, ravin, linseed oil, and water. *Patent completed.*

2959. J. H. JOHNSON. Improvements in machinery or apparatus for preparing oval picture frames. (A communication.) Dated Nov. 25, 1861. This consists, essentially, in the use of a scraper or working down tool, in combination with the force plate of an eccentric lathe, or with an elliptograph or other suitable apparatus, the scraping tool being made self-adapting to the irregularities or variations on the scraper of the frame, and its scraping edge being the reverse of the intended moulding. When an eccentric lathe is used, the oval frame is mounted upon the face plate of the lathe, and describes an oval or ellipsis when rotated, whilst the scraper remains stationary, but is held against the frame by a yielding pressure. Where an elliptograph, or other similar contrivance is used, the oval frame is laid upon a stationary bed, and the scraper is caused to travel over its surface by the action of the elliptograph, it being at the same time free to rise and fall, so as to allow of any irregularities on the surface under treatment. *Patent completed.*

2968. I. DAVIES. Improvements in the construction of roofs for dwelling houses, horticultural erections, and other buildings. Dated Nov. 26, 1861. The inventor constructs the roofs of dwelling houses, warehouses, sheds, &c., by forming the outer edge of the rafters, or of, say, every alternate rafter, with one or more grooves or channels, which he covers with sheet lead or other metal. Over these, without the interposition of battens, he places the slates, tiles, stones, &c., made of such a size that in their vertical course their edges shall abut against each other, just over the grooves or channels, to allow these latter to convey away water. In their horizontal course each succeeding one overlaps the other, and carries the water downwards in the usual way. *Patent abandoned.*

2969. R. HARGREAVES. An improvement or improvements in fastening knobs to doors, drawers, and other articles; and in connecting knobs to spindles. Dated Nov. 26, 1861. This consists in fastening knobs to doors, drawers, &c., and in connecting knobs to locks or other spindles, by a divided collar or plate, which is made to engage with the flange or shoulder which terminates the neck of the knob, or to engage with the neck of the knob. The invention is not described apart from the drawings. *Patent completed.*

PROVISIONAL PROTECTIONS.

1588. T. McIlroy, Brampton, Canada West. An improved invalid bedstead. Dated May 9, 1862.

1551. H. C. R. Joubert, upholsterer, 18 Maddox Street. Improvements in raising music chairs, stools, or seats. Dated May 14, 1862.

1512. F. C. Kirkman, Crouchend, Hornsey, and Richard Swift, Hounslow, civil engineers. A new and improved joint for uniting or fixing posts and rails of bedsteads and other articles of furniture, posts, and rails in fencing, in the construction of framework for conservatories, emigrants' and other portable houses. Dated May 19, 1862.

PARTNERSHIPS DISSOLVED.

Mowl, Brothers, Bethnal Green Road, carpenters.
Spinks and Codner, Barton-on-Humber, Lincolnshire, painters.
Newark and Sons, Coventry, timber-merchants; as far as regards W. D. Newark.
Taylor and Co., Oldbury, Worcestershire, ironfounders; as far as regards J. Botteley.

BANKRUPTCY ANNULLED.

John Lawrie Rickards, Parliament Street, Westminster, engineer.

BANKRUPTS.

Esther Perry, Enfield, plumber, July 1, at 10, to surrender at the Bankrupts' Court, Basinghall Street.

Thomas Timmis Vernon Smith, Park Road, Islington, engineer, July 1, at 11. Basinghall Street.

Samuel Wood, Queen Street, Blackfriars Road, bricklayer, July 1, at 11. Basinghall Street.

John McIntosh, timber merchant, Bow Lane, Cheapside, July 4, at half-past 11. Basinghall Street.

William Wicks, High Row, Silver Street, Kensington gravel-pits, carpenter, June 30, at 1.

Henry Wood, Birmingham, brass caster, June 23, at 12. Bankrupts' Court, Birmingham.

George Hague, Sheffield, mason, June 30, at 10. Bankrupts' Court, Sheffield.

Henry Chesworth, late of Audlem, Cheshire, wheelwright, June 23, at 12. Bankrupts' Court, Liverpool.

Robert Cleaver, Stretton-upon-Dunsmore, Warwickshire, carpenter, June 25, at 11. County Court, Rugby.

William Schneider, Middlesborough, Yorkshire, journeyman joiner, June 27, at 2. County Court, Stockton-on-Tees.

John M'Alister, Cardiff, contractor, July 4, at 11. Bankrupts' Court, Bristol.

Thomas Kirkbride Waller and Christopher Graham, Holme Cultram, Cumberland, timber merchants, June 30, at 1. Bankrupts' Court, Newcastle-upon-Tyne.

Robert Henry Howard, Kingston, Portsea, painter, July 15, at 11. County Court, Portsmouth.

George Wilson, Coppull Moor, within Coppull, Lancashire, wheelwright, July 10, at 9. County Court, Chorley.

Thomas Vaughn, Tonbridge Wells, builder, June 30, at 12. County Court, Tonbridge Wells.

William Beer, Devonport, journeyman stonemason, July 2, at 11. County Court, East Stonehouse.

George Birch, Wolstanton, Staffordshire, joiner, June 28, at 11. County Court, Hanley.

NOTICE OF SITTINGS FOR LAST EXAMINATION.

June 30, W. G. P. Britten, Bridge Road, Battersea, engineer.

July 4, A. Brown, late of Liverpool, engineer.

June 26, R. Cumberbach, Great Bolton, Lancashire, engine-fitter.

July 22, J. Parkinson, Barnoldswick in Craven, Yorkshire, joiner.

June 26, W. Dunckley, Luton, builder.

July 9, J. Steele, Stroud, cabinet-maker.

July 15, J. Talbot, jun., Sparkford, Somersetshire, carpenter.

July 8, B. Tranter, Tipton, cooper.

July 9, W. Dunhill, Pontefract, journeyman joiner.

July 11, M. Page, Stratford, builder.

July 10, H. Gratton, late of Canning Place, Kensington, Rolls Buildings, Fetter Lane, Chancery Lane, and Poet's Corner, Westminster, engineer.

July 10, C. Phillips, Totteridge, Hertfordshire, carpenter.

July 17, H. Grove, Rowley Regis, Staffordshire, carpenter.

July 15, A. Ford, Newark-upon-Trent, coachbuilder.

June 24, G. Burton, Bedford, engraver.

June 25, R. Bullimore, the younger, Great Yarmouth, house carpenter.

July 2, E. Jones, Edge Hill, West Derby, bricklayer.

July 3, J. Andrew, Crookes, near Sheffield, journeyman joiner.

July 12, J. Fletcher, Torquay, carpenter.

July 29, J. Hailstones, Chatterley, Staffordshire, mining contractor.

July 5, H. Burrage, Brighton, plumber.

July 5, R. Puttick, Brighton, carpenter.

June 30, A. Piper, Tonbridge Wells, labourer.

June 25, T. Fox, Great Yarmouth, builder.

DIVIDENDS.

July 11, G. Scott, Cubitt Town, Isle of Dogs, engineer.

July 17, G. Roper, Bincombe, Dorsetshire, builder.

July 9, W. Sparke and E. Brydges, Strand, ironmongers.

July 4, T. R. Oswald, Sunderland, ship builder.

SCOTCH SEQUESTRATION.

George Battie, Edinburgh, builder, June 20, at 1. Dowell's and Lyon's Rooms, Edinburgh.

TO CORRESPONDENTS.

We cannot undertake to return rejected communications.

WORKS IN PROGRESS.—We shall feel obliged to any of our readers who will favour us with notes of works contemplated or in progress in the provinces; in most cases a simple mention that a work is about to be, or has already been commenced, will be sufficient.

Received.—W. R. M., M. O. S., J. R. W., T. D. J., P. and A., M. B. N., J. W. T., E. H., G. and B., T. H., B. L. D., T. A., G. S., J. W. W., E. H., W. B., E. B.

** NOTICE.—The BUILDING NEWS is now published at 166 Fleet Street, where all Communications and Advertisements should be addressed.

MR. G. G. SCOTT, ARCHITECTURE, AND CIVILISATION.

GO where we may, we meet with egotistic people. Most people think more of themselves than others think of them. They put a higher price on their works than can be realised. They think more of their own profession than all other professions put together. Mr. G. G. Scott is one of those people. Listen to what that gentleman said in his lecture, at the South Kensington Museum, on Tuesday week, "On the Formation of a National Museum of Architecture, viewed in connection with its Bearings upon Mediæval Art." "*The history of architecture*," says Mr. Scott, "*is the history of the world; it is the history of the changing power and dominion of races and nations; it is the history of human thought, and of the growth, the fluctuations, the decay, and the revival of human civilisation.*" This is a fine sentence. Let us analyse it, and see what it is made of. We have hitherto considered architecture to be one of the expressions of a people's intellectual and industrial condition; one of the manifestations of its social and religious life. But Mr. Scott steps upon the scene, and recklessly brushes away every other incentive to action, every other spring of human progress. If he is correct, henceforth and for ever architecture and civilisation are synonymous terms; and science, religion, freedom, agriculture, statesmanship, heroism, patriotism, navigation, literature, geographical advantages, race, and the thousand-and-one things which make up the sum total of human effort, progress, and happiness, are as many empty names.

We do not remember seeing or hearing a single sentence which contains so many mischievous fallacies as the one just quoted, and we are surprised that some one did not rise in the meeting and rebuke Mr. Scott for his misconceptions, his exaggerations, and extravagant language. If this is a fair specimen of his teaching, then are the blind leading the blind. We are prepared to give Mr. Scott or any one else "ample room and verge enough," where he may air his hobby to his heart's content; but when he ignores everything and everybody else, when he builds up his pet idea on the ruins of ideas equally dear to other men, when he advances the pretensions of his own profession at the expense of other professions, when he gives a contemptuous go-by to every great element of civilisation in order to magnify the one which he represents, he speaks egotistically, incorrectly, and deceptively.

Mr. Scott makes architecture the be-all and end-all of human life. Men, according to this theory, are born for no other purpose than to build and decorate houses and cathedrals. When a man has done something towards the architecture of his country, or, we suppose, stood in its presence and uttered some grandiloquent language about it, he has answered his purpose and may go hence. Mr. Scott's description of architecture reminds us of the Wesleyan preacher, who used a great many fine words to prove that all the vast enjoyments and employments of the inhabitants of heaven consisted in psalm-singing. When about to take a tour in Wales, some years since, a Welshman, less egotistic and more satirical than most of his countrymen, said that if we wished to make friends wherever we went, we should say that Adam was a Welshman, that Paradise was in Wales, and that the Welsh language would be the language of the millennium. In a similar way, any one may make a friend of Mr. Scott by saying architecture was the alpha and omega of human existence and human history.

Now civilisation is not so simple and so one-sided a thing as our mediæval teacher would have us believe. It is many-sided, and derives its life and power from many sources. Mr. Scott, in developing his idea of an architectural museum, appealed to classical times and peoples. Nobody knows better than that gentleman, that the Greeks were as famous for their language, their literature, their laws, their patriotism, and their martial prowess, as they were for their architecture; and that ancient Rome rendered herself more famous by her orators, generals, colonisers, consuls, and lawgivers, than she did by her architects, and that she wrought her impress more deeply in the world's civilisation by her Will than she did by her conception of Beauty.

It would be impossible to say in a single word or a single sentence in what our English civilisation consists. We are a peculiar people, and are doing as much, if not more, for civilisation than any nation that has existed or does exist. No doubt, if certain one-idea men were appealed to, they would easily define to their own satisfaction the true secret of England's greatness and her true mission amongst the nations. One would say that the English were a great people, because the blood of many races mingles in our veins — that the Saxon, the Celt, the Scandinavian, the Teuton has each, in his turn, contributed to our strength. Another would show that the power of the Englishman consisted in his individual freedom, in his municipal institutions, and the constitutional government under which he lives. Another would point to facts, and prove that the sources of our strength and our progress were in our geographical position, and

in the treasures of tin, copper, iron, and coal, under our soil. Another would point to the application of the principles of political economy and free trade amongst us as the source from which our national energies are fed. Another would say that England was mighty and renowned because "Britannia ruled the waves," and that, as a consequence, our commerce whitened every sea and kissed every shore. Another would maintain that our commerce, our agriculture, and our enterprise depended on the application of science to industry, and that the English were particularly distinguished for regulating and utilising the forces of nature by scientific appliances. Even Mr. John Bright, whom some would accuse of being a one-idea man, stated in the House of Commons, a short time since, that our greatest men were not our warriors or our statesmen, but our engineers, who created new industries for men, and transformed the face of nature. But Mr. Scott appears to see little or nothing in the applied sciences, in industrial endeavours, in well-regulated laws, and admirably balanced constitutions. One subject attracts his gaze and absorbs his attention. He has been so long accustomed to the "dim religious light," that his vision is impaired. All other things, whatever may be their age, their magnitude, or their influence, are but dust in the balance, when compared to architecture, for "the history of architecture is the history of the world; it is the history of the changing power and dominion of races and nations; it is the history of human thought, and of the growth, the fluctuations, the decay, and the revival of human civilisation." Here, certainly, the "nothing-like-leather" theory has reached a climax. Sea-kings, conquerors, Tubal-Cains, Cæsars, Luthers, Cromwells, Ciceros, navigators, discoverers, Homers, Dantes, Napoleons, Shakespeares, are mere waifs on the mighty stream of architectural civilisation. It has been said that every mother's duck is a swan, but Mr. Scott's duck is a bird of paradise, whose plumage is so dazzling that it utterly eclipses all surrounding objects. If Mr. Scott were a general, he would extinguish the stars for the sake of Mars.

No good result can be gained by exaggerations like this. He is the truest artist and the best teacher who can see things in their true light and real proportions, and who can assign to each art, science, and organised effort its relative importance. The hand must not say to the eye, "I have no need of thee," neither must the heart say that the brain is superfluous. All organs and faculties must harmoniously work together for the correct life of the individual; so must the musician, the soldier, the miner, the husbandman, the metal-worker, the architect, the navigator, the philosopher, and lawmaker work together, each in his particular sphere, for the general good. Let me make the songs of a people, said a statesman, and I don't care who makes their laws. What would Mr. Scott think, if Tennyson, before an audience of literati, said, "The history of poetry is the history of civilisation," &c.? Would he not think that the laureate was the victim of a disordered fancy? May not the laureate return the compliment? Does not literature exert a much more potent sway over civilisation than architecture? Let not the poet attempt to snuff out the architect, or the architect attempt to snuff out the poet. Each has a mission to perform essential to the higher wants of man. Civilisation, in its slow but sublime march, asks for the poet's song, the orator's electric fire, the worker's anvil and furnace, the warrior's courage, the architect's realised conceptions, the patriot's struggle, and the martyr's blood. All are invited to bring their respective contributions to the sum total of individual and organised endeavours. Mr. Scott will do a more worthy work if he will occasionally come *outside* the Mediæval edifice, and acknowledge the presence of trees, streams, mountains, flowers, and stars. At all events, he may acknowledge the existence of, and give a passing salute to, other workers in the vast vineyard of civilisation.

INTERNATIONAL EXHIBITION.

CARVED GOTHIC STONWORK.

A SMALL court to the south-east of Minton's Majolica Fountain, in the International Exhibition, daily attracts a peculiar class of visitors. Mere sight-seers tacitly acquiesce in the obstruction which has been placed before its entrance, and indulge only in a somewhat distant view of the several groups of inlaid masonry and jewelled stonework. A few, seeking a short return-cut from the rear of Magnus' Enamelled Slate Court to the main avenue, find further progress here impeded by the dark cellar which forms its northern boundary, and which contains the shattered hopes of several disappointed contributors, mingled, in dust and dirt and damp, with colour-pots and lumber. Thus checked, they look for a moment through the sash partition into the gloomy cave, and then bestow a glance or two upon the fine works with which they have undesignedly been brought into close proximity. The visitors who seek out the court, and purposely examine its contents, are men of clerical appearance, dressed in solemn seriousness, upon whose faces beards are never

seen, whose shirt fronts are veiled by broadly-spread glossless waistcoats, and whose coats are long and without a blemish. Hats with a quaint curl of the brim, cover some of their heads, and cloth gaiters their lower limbs. Their opinions of the different works are given rather loudly, with a measured stateliness, to their companions, and are regulated more by their affection for High or Low Church, than by their acquaintance with high or low art. The same section of Englishmen are seen in force in what is called the Mediæval Court, condemning contemptuously, or preposterously praising, that which is the embodiment, in wood or stone, of their several predilections. Stirring busily amongst these quietly moving men, are others more voluble, who appreciate every piece of fluor-spar mosaic which Mr. Street has set in his work, every line of colour and square of marble which Mr. Bentley has designed, and every figure and fragment of ornament which Mr. Earp has with such unerring precision hewn from the rough stone.

This Court is devoted to the best work of one of our ablest Gothic carvers, Mr. Thomas Earp, of Kennington Road. The examples of his craft are here gathered for a little time together, before being dispersed to their several destinations. One only has been expressly prepared for this Exhibition. It is a little richer in its decoration, but no better in its execution than the others, which are the ordinary productions of his workshop. We thus have a fair sample of his skill, and it is satisfactory to see that it is not here wasted upon unworthy design. It is, perhaps, quite natural that architects who can design like Mr. Street, Mr. Bentley, and Mr. Nesfield, should appreciate Mr. Earp's ability to do justice to their conceptions; but it also too frequently happens, that men of feeble powers seize upon a strong and experienced hand to eke out their little knowledge. Saddening work of this latter kind must have entered for reformation into Mr. Earp's as into other men's workshops, but we have no specimen of it here, and we distinctly repeat, they are no show specimens of Mr. Earp's work, although they may be of what his work is only occasionally united with. He cannot be expected to devote himself exclusively to our foremost architects, and is no doubt content that they have afforded him opportunities of testing his capacity to compass their conceptions, and of showing how Gothic carving can be done.

On the left of the Court stands a dairy fountain designed by Mr. W. E. Nesfield, for the Earl of Sefton. It is about 6 ft. high. The whole is of stone: the large circular basin is lined with lead, which laps over the top, where it is ornamentally cut, and secured with large conical-headed nails. This basin is carried by eight detached dwarf columns, with wide spreading basins and carved capitals, which cluster round a sturdy central shaft. From the centre of the basin rises a short column with a green marble shaft and splayed abacus instead of capital; foliage, curling outwards, ornaments its angles, and engraved metal plates its sides. The jets of the fountain come through these plates and are fashioned into metallic resemblances of dolphins' heads—not the blubberous bunches which renaissance architects have bequeathed to us, but, instead thereof, something wherein the grossness is pared away by art, making them much fitter for their purpose, and in better harmony with the ornament to which they are allied. The vertical sides of the basin are decorated with incised representations of spring, summer, autumn, and winter, and between each of these subjects squares of mosaic marble are inlaid. On one of these mosaics a peacock is portrayed, with a delicious combination of coloured material, but what analogy there is between the proud bird and a dairy, we are at a loss to discover. On another, a quaint conceit reveals to us the milky way—"thick inlaid with patines of bright gold" and circles of creamy whiteness. The architect might as well have given a plain English name to this panel; it would have been as comprehensible as a good and far better than the bad Latin one which it now bears. There is a trifle of affectation in the subject panels, which might, moreover, we think, have been more appropriately filled, but the design altogether is a grand one, and well realised.

Near this fountain is the reredos for St. Philip and St. James's Church, Oxford, designed, as all our readers know, by Mr. Street, and carved by Mr. Earp. It consists of a central pointed arch, with foliage in the angle-mouldings, supported by the carved caps of green shafted dwarf columns. The abacus of these columns is extended as a string on both sides, where, over it, single trefoil-headed niches or deep sunk panels are introduced, and under it the surfaces are decorated with inlaid colour. A large and two smaller plain gables, crowned by finials, surmount the three panels respectively. The side panels contain figures of a couple of saints, and the central one a well carved representation of Christ in the Garden. The reliefs have a true mediæval sentiment, without an atom of the bad drawing which is by too many considered inseparable from it. Cusps are introduced superficially in the large panel following the lines of the arch, and their spandrels are studded with globules of spar, which we venture to think are no improvement to the design. The surface of the reredos is decorated with red and green inlaid ornament, which,

if the result be not caused by its association in this Court with more brilliant work, is too low in tone and has rather a common-place tawdry appearance.

If its juxtaposition with something finer mars its effect, the damaging neighbour is Mr. Street's own work. It is the excellence of the pulpit for Bournemouth Church which overshadows that of the Oxford reredos. No finer work ever came from Mr. Street's hands, no better carving ever left Mr. Earp's. The "fatal facility," for designing ornament and figures which too often crowd the details of Mr. Street's designs, is here kept well in subjection, although we must own that, spite of its faultless execution, and of the purity of its conception, we should not have mourned the loss of the angel which supports the reading shelf. It is, even with this drawback, a most lovely piece of work, rich and yet delicate in its colour, bold in its supports, and tenderly treated in the belt of arcaded alabaster which they bear. The lower portion is of stone. The dwarf columns rest on a high plinth and their moulded caps die beautifully into the hollow which bends forward to enlarge the upper portion. The lower portion of the drum is formed into quatrefoil panels, filled with a lovely arrangement of green, grey, red and white marbles, and a central disk of spar set in a slight ring of indented stone. The alabaster arcade is continued round, and forms the boundary of the pulpit. It has trefoiled arches, and splendidly carved heads in the spandrels, and the whole is capped with a moulded cornice, having a tooth ornament. The pulpit is a fine example of harmonious colour. Stone, alabaster, and coloured marble all help each other. They are not only rightly placed, but they are what is perhaps less studied by modern architects, of the proper tone. There is nothing violent, strained or affected in the work, and the more we examine it, the greater is our admiration both of the design and of the execution.

The little font at Huntley Church, designed by Mr. S. S. Teulon, and carved by Mr. Earp, is a very good specimen of the purer English Gothic work, that is, it has no colour, except in shafts of columns, and contains less admixture of foreign elements. It is an octagon, supported by four columns with carved caps. The ordinary baptismal emblems are introduced, in panels, on the octagon sides, and half-figures of angels at the root of the basin are so well incorporated with the design, that they appear to grow out of, instead of being stuck upon it. Between the columns, standing or sitting on the plinth, mannikin emblems of the Evangelists are placed. They are beautifully carved, but the little dolls are no ornament to the design, and their removal would relieve it of its only puerile features.

Mr. Bentley's reredos, executed expressly by Mr. Earp for the Exhibition, is built up on the southern side of this Court. It does not, perhaps, in delicate and tender treatment, equal Mr. Street's Bournemouth pulpit, but it is, nevertheless, a remarkably fine work—rich in material, and richer still in art. It is divided horizontally into three compartments, the lower one is intended to be fronted with the altar, and is, therefore, plain, with only an angle column at each corner. The central compartment bears six panels, filled in with what appears to us a continuous representation of St. Michael's combat with the devil. The figures are white, on a black ground; surrounding the diamond slabs which bear these representations are green and red marble mosaics, with jewelled centres. The alabaster framework is chased, and filled in with colour. Marble shafts rest on a broad black string below, and enclose on either side the whole of the reredos. A kind of buttress, highly and originally carved, rests on each of these caps, and is united with the main cornice. The upper compartment is divided by marble shafts into three divisions, which bear upon their projecting caps figures of Uriel, Michael, Gabriel, and Raphael, beautifully carved in white alabaster. These three divisions are filled with oval panels. The two outer ones contain figures in relief, and the centre one a rich jewelled cross, with emblems of the Evangelists between the branches; a mosaic ground is fitted to all the panels. Another row of rich fluor-spar jewels runs along the top of the cornice. The reredos would be a striking feature of any church, but we should like to see it in a building designed and executed in thorough keeping with it.

Another joint production of Mr. Bentley and Mr. Earp ornaments the nave. It is a drinking-fountain. To say that it is better than any hitherto built in London, is but poor praise. It is fully equal in merit to the reredos which we have just described, and has the same amount of thoughtful originality and dexterous workmanship.

Adjoining Mr. Earp's court, the doorway of the mortuary chapel of the Digbys, now building at Sherborne, Dorset, for G. D. W. Digby, Esq., is partly built up. The arch over it is wanting, but a photograph placed by the side of it enables us to realise its effect when complete. It is very early pointed, and every moulding of the jambs and arches is crowded with foliated ornament. The shafts of the columns are of coloured marble, but Mr. Slater, the architect, has not, we think, been happy in his selection of the colours; we question if a variety in them was necessary, but, at all events, the alternate red, green, yellow, and red, do not enrich the work, and in the inside, where two

colours are introduced in the same shaft, separated only by a stone ring, the effect is disastrous. The tympanum of the arch will contain the sculptured group now exhibited in the Mediaeval Court by Redfearn. The carving is excellently done by Messrs. H. Poole and Son, of Great Smith Street, Westminster. The same carvers, in the immediate vicinity, exhibit two fine and valuable specimens of inexpensive wall surface decoration, which depend almost entirely upon the ability with which they have been designed. They are made by incising slabs of alabaster, and filling in the channelled lines with different-coloured cements. In the centre of one, there is a good and original representation of the Lord's Supper, boldly etched from Mr. R. T. Bayne's design (of the firm of Clayton, Bell, and Bayne, the well known glass painters). The essential point in this system of decoration is excellence of design, and this Messrs. Poole have procured. Over one of these specimens, on the east wall, we find eight carved bench ends, designed by Mr. Slater for Chichester Cathedral, and executed by Mr. Forsyth's practised hand. Like the doorway of the Digby Chapel, they are crowded, perhaps overcrowded, with work, and like it the work is of the best kind.

Near it, a long unfinished reredos, by Mr. James Williams, of Ipswich, awakens a regret that so much labour should be applied to so little good purpose. When we say that the central compartment aims at producing a reduced copy of Leonardo da Vinci's Last Supper in relief, it is sufficient, perhaps, to characterise the work. The other compartments represent incidents in the life of Christ. We are sorry to condemn anything which may be the production of a working man, ambitious of exhibiting his work amongst the productions of the world, but there is nothing to interest any one who knows aught of art, except an industrious, although unsuccessful attempt to achieve something great. As regards design, whether of architecture or sculpture, it is in no way better than the specimens executed by the students of the Architectural Museum. The prize designs for wood carving exhibited by the students of the Architectural Museum, placed in the immediate neighbourhood, are very creditable productions, and the extra prizes were well earned, and very properly bestowed.

If the huge ungainly pulpit, which Messrs. Cox and Son exhibit in this part of the building, be sent simply as an example of the facility and cheapness with which Corsham Down stone may be most elaborately carved, there can be but one opinion about its success. As a work of art it is not worth as many pence as it is ticketed with pounds (80). It is in shape like a grog-tumbler, and represents an oak-tree, with its gnarled root and trunk as a support. It is covered with leaves, admirably copied we admit, but what has it all to do with a Christian church? What building could it suit, or what structure could be built to suit it? It might be becoming to a portly member of the order of Druids, whose ignorance of art and affection for the oak might cause him to feel proud within or before it, or it might be inoffensive in the chapel of the Asylum for the Blind. We can think of no other destination for it, even at the insignificant price put upon such a large display of skilful labour.

THE ARCHITECTURAL ALLIANCE.

IT is proposed (as was suggested by us not many weeks ago) to hold a preliminary meeting of deputies from Architectural Societies, to establish an Architectural Alliance, on the 2nd of July. Whatever the result, for we cannot but feel that as yet the Alliance is only a mere project, and one which it will be perhaps difficult to render practical, we must honour the intentions with which the scheme is planned, and desire that they may be fulfilled at no remote time, and in no scanty measure. An intimate relationship among the various members of the profession, and a correspondence between the various societies, are most desirable, but we are not sure that the machinery now proposed is exactly the best for accomplishing these ends.

Perhaps the proposed alliance may be either greatly modified, abandoned, or superseded; in either case the promoters will no doubt feel disappointment. The great aim, however, to be gained is not the establishment of this or that mode of union, but the recognition by the societies and their friends, of the idea of union, cooperation, and correspondence. That recognition is partially accomplished, and no amount of difficulty or delay can rob Mr. Pritchett and his friends of the credit of drawing attention to it, and impressing it on the minds of many, as well as familiarising the societies with it, and having sketched an outline upon which it may be based.

In our article already referred to, we spoke of the conspicuous absence of the Institute, and we cannot help feeling that the scheme ought to have emanated from that body, or at least to have been promoted by it. It now remains to be seen whether (as in some other cases) the Institute will adopt what it has not initiated, will propose a scheme of its own, or will prefer for the present to stand aside. An association of Societies with the Institute at its head, is probably, if not certainly, one of the things which sooner or later will be realised.

As it may be a necessity, or at least is becoming one, it would be graceful to recognise the movement which originated in the North, and to give it the benefit, support, and guidance which the leading Society can so well furnish.

If, declining this course, the Institute adopts a plan of its own, we hope it will be such an one as can command the cordial cooperation of the other societies.

We hope that the delegates who are to meet on Wednesday will not lose sight of these considerations. The abstract principle that an alliance is desirable, will probably be agreed to at once. The simple organisation proposed, stands a fair chance of being adopted, and the delegates may think their work done, when, in fact, the serious part of it has hardly been touched. Organisation is a simpler matter than mastering the difficulties of the work to be performed. These difficulties, however, must be foreseen and provided against, or they will compromise permanent success. They have their rise partly in the novelty of the proposal, partly in the fact that it has not originated in the metropolis, and partly in the temper and the instincts of the bodies of men most chiefly interested. Good feeling, good sense, and openness, an earnest desire for the general good, and the forbearance and conciliatory spirit to which such a desire gives rise, will, however, overcome, in the long run, all obstacles; and if only these qualities be brought into play, we doubt not that the history of the alliance of Architectural Societies will be a long and a happy one.

THE EXHIBITION AND THE SATURDAY HALF-HOLIDAY.

A CORRESPONDENT in another column calls on the Commissioners to open the International Exhibition on Saturdays for a shilling. We see many reasons why this should be done, and scarcely a reason why it should not be done. The only reason of any force which can be brought against the suggestion is that the season tickets were purchased, in the first place, with the distinct understanding that Saturday should be a five-shilling day, and that an alteration would be an infraction of an agreement. Now, as season ticket holders, in most cases, can attend almost any day of the week as well as Saturday, without any inconvenience to themselves, we think the Commissioners would be perfectly justified in making the alteration. There can be no doubt that such an alteration would be hailed as a boon by hundreds of thousands; the revenue of the Exhibition would be improved, and a significant encouragement would be given to the Saturday half-holiday movement. These are three advantages which would more than counterbalance any inconvenience that might be felt by the few. We hope the Commissioners will well consider the suggestion with a view to its adoption, and they would do something to efface the memory of the many blunders committed in the earlier stages of the Exhibition.

INTERNATIONAL EXHIBITION.

MACHINE TOOLS.

IN instituting a comparison, as many of us are able to do, between the "Machine-tools" shown in the Exhibition of 1851 and that of 1862, we can scarcely fail to be struck by the fact, that really very few improvements have been made in them during the eleven years which separate the two great events. In speaking of machine-tools, we refer more especially, however, to those which are used in the manipulation of iron. For instance, the lathe, planing, slotting, and drilling machines exhibited on the last might very well take their places on the present occasion, so slight is the alteration which has been made in them. The lathe is by far the oldest contrivance of the series, and it is still the most generally used in the construction of machinery. In its most complete and perfect form, as, for example, when made by our Whitworths and our Fairbairns, the lathe may be considered as a kind of universal appliance, for to a great extent it may be made to supply the place of every other. It will bore, drill, cut the threads of screws, and even plane the surfaces of iron plates. The lathe was exceedingly well represented in the Exhibition of 1851, and little more can be said of it in that of 1862. We are aware, nevertheless, that, owing to the general increase in the size and power of steam-engines, and especially of those for marine purposes, many gigantic lathes—which could not well be sent to South Kensington—have recently come into existence. These are principally used for boring out large cylinders, turning monster crank-shafts, and for other purposes of a like character. Still, we maintain that few actual improvements have been made in the lathe, as a machine-tool, since 1851.

Pretty nearly the same remark applies to the planing-machine. This has certainly undergone no startling modification during the last eleven years, though it is, in some minor respects, improved. Again, the monstrous size of some of these has prevented their being displayed at the Exhibition, and, in order clearly to understand the changes effected in their construction, it would be necessary to make a tour of the great engineering establishments of the United Kingdom. The ends of mammoth girders, for railway and

other bridges are, in many instances, planed, and this has necessitated the introduction of machines of corresponding magnitude for the purpose of accomplishing the operations. In such cases, planing-machines are shop fixtures, so to speak, and specimens of them could scarcely be expected to be found in the Exhibition.

In speaking of the small apparent advancement which has been made in machine-tools during the period alluded to, it must not be supposed that we are indulging in the propensity for fault-finding which is said to be characteristic of Englishmen. We merely point out a fact, which, as scientific journalists, we feel bound to do, and which indeed to the mechanically trained eye is strikingly apparent. Machine-tools have, during the last quarter of a century, played a most important part in the economy of engineering and mechanical establishments, and in the future their mission will be of a yet more momentous nature. The want of such appliances was most painfully felt by the early manufacturers of steam engines, and Watt in particular, must have been greatly embarrassed thereby in his strenuous and successful endeavours to improve this wondrous machine. As usual in the mechanical world, necessity gradually incited invention, and this evolved machine-tools. Nasmyth's construction of the steam-hammer arose from the necessity of forging an unusually large shaft of iron. The impossibility of guiding with accuracy a hand-turning tool, led to the formation of that invaluable adjunct to the lathe—the slide-rest; and the vibration of a bar of iron, while being turned in a single lathe incited Whitworth to the devising a duplex instrument. Numerous instances of a similar nature might be adduced, and those who are familiar with the interior arrangement of a mechanical workshop, are aware that ingenuity is constantly being exercised to overcome incidental difficulties. In reality machine-tools are now the means by which almost all improvements are effected in machinery, and thus indirectly they minister largely to the progress of the arts and sciences.

It would be scarcely just to omit saying that in the matter of machine-tools, the foreign exhibitors have made a display in 1862 far in advance of that made by them in 1851; but then in the last-named year they cut a very sorry figure.

BUILDING OPERATIONS IN PARIS.

(From our Paris Correspondent.)

THE impression forced upon me by the vast architectural works of the last few years in Paris is that, with every drawback which criticism can suggest, the architects of France are on the way to develop a truly national school of architecture, which will not be a mere *réchauffé* of ancient Gallie art of any former period, but a style which, though arising from a development of the Franco-Italian manner of the sixteenth century, will yet possess sufficient originality, both in principle and detail, to give it a claim to almost entire originality. The developments of the architectural feeling of the Renaissance and immediately succeeding periods are, though perfectly legitimate, yet so free and striking, that they have nothing of the disappointing effect of those slavish reproduction of models belonging to former periods, which, however great may be the skill of the imitator, are always inferior to the originals. They are not, and necessarily cannot be, or appear to be, instinct with the artistic life of an epoch. The very best of such reproductions are mere shams; they are, as it were, wine from a bottle that has been opened long ago; there is no effervescence about them—no sparkle of real vitality. But when a former style, a suitable and national one, is taken merely as the nucleus of a new one, merely as a centre from which appropriate variations, dictated by the spirit of the time, are to radiate, exhibiting palpable signs of a new life at every point of the circle of its operations, then a legitimate use is made of the models, spared by time, which the genius of our artistic forefathers has bequeathed to us.

The additions to the Louvre have been devised and executed, to a great extent, in this spirit, and with all flaws and defects, which are many, they must be, on the whole, regarded as among the most remarkable productions of modern architecture. But it is in the street architecture of Paris, that the most originality of a genuine kind has been exhibited. In great works immediately under the control of the Government, such as the completion of the Rue de Rivoli, &c., the principle of uniformity, and a strictly military alignment, have shackled the invention of the architect, even in his treatment of merely decorative features; but where no such impediments have stood in the way of the artist, true architectural gems have sprung up, that in many respects leave far behind the most graceful structures, even of the graceful age of Francis I.

There is not, at the present moment, any architectural work of strikingly novel character in progress, and yet much is going on well worthy of a passing record. Those acquainted with Paris and its public establishments, cannot fail to remember the situation of the "*Conservatoire des Arts et Métiers*," in the most crowded part of the Rue S. Martin. The establishment is one devoted to the protection and encouragement of improvements in various branches of manufacture, and to the preservation of models of new machinery, &c., &c., for which protective *brevets* have been granted. The establishment has long occupied the remains of the extensive buildings of the ancient Priory of S. Martin, suppressed at the Revolution. During the present régime, many improvements have taken place in the adaptation of the building to its present purposes. The entrance, however, was obstructed by several houses, which had been built by the monks along their frontage to the Rue S. Martin, with the view of increasing their already plentiful revenues, and in that commanding situation the project no doubt

answered the expectations of the worthy speculators. These houses were built in the years 1713 and 1714, so that their existence of but a single century seems but a short one for such solid structures.

The space gained by the removal of these houses, not only throws open the present façade of the main building, but affords space for the erection of a new gallery adjoining the library, which is the ancient refectory of the Priory. During the removal of the obstructive buildings, the last finishing touches are being given to the exterior of the pavilion that forms the *cage*, as it is termed by French architects, which encloses the principal staircase. Upon the interior of this structure architectural ornament is being lavished with unsparing hand, the decorations having now been nearly four years in progress, and they are not yet completed.

During the present series of alterations and additions, restorations also are taking place. The apse of the ancient church of the Priory, a portion of the original building still remaining, and which belongs to the architecture of the eleventh century, is undergoing thorough repair and restoration, as are a portion of the ancient embattled walls, and one of the mural turrets.

From the mass of modern buildings which occupy a great portion of the ancient quadrangle of the monastic building, a vast and lofty chimney has been rapidly rising, the daily progress of which has raised the curiosity of the neighbourhood. Some hinted at the secret structure of vast furnaces, in which iron ore, procured from England at the reduced duties of the new commercial treaty, was to be smelted for the private use of the government, or of some influential official, and many other explanations, equally extravagant, of the object of the great chimney, were current in the *cafés* of the Rue St. Martin. The structure in question is, however, nothing more than a ventilator for the lecture rooms, on the principle recently adopted, and found so effectual, in the *Nouveau Cirque*, and in the *Théâtre Lyrique*.

Speaking of theatres, I may mention that the façade of the new theatre in the Rue du Caire is just completed, the theatre being intended to replace the old Gaîté. I do not admire the architectural design sufficiently to tempt me to give you a detailed description of its leading features, though the design has yet a certain character that is not without its promptings and suggestings to a careful student, who is determined to learn something, even from an inferior model.

In other parts of Paris, works of various kinds are going on, the present government being always on the look out for means of employment to the teeming and restless population of the Faubourg St. Antoine, and other quarters, where it is deemed that want of employment is generally the precursor of political agitation. It is true that there is not another Rue du Rivoli to finish, nor, precisely, another Boulevard Sebastopol in process of creation, nor yet another Louvre, employing its thousands in a grand work of completion; but architectural works of more or less importance are nevertheless going on. On one side active destruction of the old is rife, to make room for the new, or the other fresh structures are as rapidly rising.

The destruction of old buildings in the more crowded parts of Paris, and the erection of superior and more spacious houses in their place, is not only a great improvement, architecturally speaking, but will tend greatly to render the sanitary state of the great city more satisfactory; yet the removal of the more humble dwellings to make room for comparative palaces, is raising just such an outcry in Paris, as that created in London by improvements of a similar character. Where is the working population to go? Where are the small masters to find houses or lodgings, if you use up all the ground for dwellings only suited to the wealthy?

The last stones of the Pont de Louis Philippe are being torn from their concrete foundation, where one might have thought them safely embedded for, at all events, some generations to come, and in a few weeks not a vestige will remain of a structure that was meant to be a dynastic monument, as well as a public convenience. Close at hand, a new stone bridge has suddenly arisen; which is just receiving its completing features, in the form of the handsome *accouodoir*, which is now being placed above the handsome balustrade; while, not far distant, a new iron bridge has shot across the Seine, to afford almost superfluous convenience to a certain small section of the population of Paris.

The eastern point of the island of Notre Dame is the site selected for the new *morque*, the foundations of which, below the bed of the river, have been, after much labour, made solid and secure. The works have been carried on within a vast coffer-dam as for the piers of a bridge, the first stones being laid upon a flooring of enormous tiles. With a greater expanse of water surrounding the works, one might have fancied that the foundation of a Venetian palace was being laid in the treacherous sands of the Laguna. Notwithstanding the occurrence of many difficulties, the foundations are now safely completed, and the walls of the new *morque* have risen to about the level of the river; the works being evidently destined to proceed with rapidity. I have not seen the design; but it will, in all probability, be highly characteristic, as the subject is one which comes peculiarly within that scope which French genius generally treats in an effective manner.

Preparations for another new Boulevard are proceeding energetically to the south of the Hôpital des Invalides, which, though not planned upon the same scale of magnificence as those which prepared the way for the street palaces of the Boulevard Sebastopol, are yet destined to give rise to building operations of a very important class; for the development of suitable sites will doubtless lead to the erection of residences of superior character in this quarter of Paris, which has, as yet, remained tolerably free from modern innovation on an extensive scale. These, with the continued development of ordinary street architecture, in more and more elaborate forms, afford plenty of food for observation to a travelling architect. In every thoroughfare of importance that has not been already rebuilt within

the last ten or twelve years, the crash of old houses in process of demolition is heard; and the bustle attending the erection of new and more splendid structures, intended to fill their places, is everywhere going on. The architectural profession must be in a thriving condition, and the building trade a good one in the Paris of to-day.

The architectural drawings in the foreign department of fine arts in the International Exhibition, of which I observed a very instructive account in the BUILDING NEWS a fortnight since, will serve to give the English public some notion of the tendencies of modern architecture on the Continent; but the display is scanty, and many of the most eminent French architects of the day are not represented at all. I propose, therefore, on a future occasion to attempt a description of some of the more striking architectural works which have been completed within the last few years in Paris and other continental cities.

A HOUSE FOR THE SUBURBS.*

WITHOUT aspiring to the especial attention of architects, the second edition of this work, which differs widely from the first, takes a position not previously occupied, and affords in a popular way a large amount of information. An architect acquainted with the current desiderata of house building, and mingling in suburban society, is just the man to throw out some useful hints, unclogged by the formality that often repulses the non-professional. The subject, says Mr. Morris, "has not appeared to demand extreme precision, but to admit of adequate representation by the characterising lines, articulating dots, and supporting touches of a sketch, rather than to call for the elaboration of a picture."

A glance at the transitional state of the metropolis accounts for the daily migration of Londoners and the growth of populous environs, while the characteristics of soil, climate, and scenery are noticed with reference to the selection of proper localities. "Nothing," it is said, "can be more conducive to the architect's success than a well chosen position for his work, and no part of his duty more urgently demands his careful study, though it not unfrequently happens that all choice on the subject is precluded by some step taken under the erroneous impression that nothing but the building would have any interest for him, and in utter unconsciousness of the artistic advantages pertaining to one spot over another."

The economy of space is touched upon and exemplified by the treatment of a plot containing half an acre at Wimbledon Park. As to price, upon which some information is also given, it ranges from £50 an acre at the extremes of the home counties to something like a million in the heart of the city! "An enormous realisation is therefore open to the Bank of England, whenever it may think fit to consolidate its straggling offices into a grand convenient edifice, and appropriate the superfluous part of the site to a new Stock Exchange and other monetary establishments, with a dividing thoroughfare from Threadneedle Street to Lothbury."

As to the consideration of plans adapted to the immediate purposes and habits of the present day. "No architectural quality of a dwelling conduces so extensively to the satisfaction and comfort of its occupants as a well contrived plan, and nothing is more inconvenient in result than ill considered or misconceived arrangements. I have been painfully conscious of this in making some alterations to an ancestral edifice, where the whole arrangement is left handed, the best and warmer aspects being occupied by offices and stables, while the family rooms are confined to the biting north and east, a defect that can only be alleviated at considerable cost and never entirely overcome."

We are shown a pair of semi-detached houses, which Mr. Morris defends against the imputation of Cockneyism.

Next there is a square-looking Italian house with conservatory erected near Blackheath, on a site containing only a quarter of an acre. These are on the "compact" plan, with offices in the basement; but the next in order, the

"Glebe house" (see illustration), has the offices extended on the ground level as is usual in the country. Mr. Morris gives some particulars of parsonages built in various parts of England, "but it is necessary to say that as the conditions and interests of clerical incumbency differ from those of ordinary proprietorship, the parsonage scarcely offers to the skill of the architect that full opportunity for contrasting effect with cost, which is so welcome under freer circumstances, and so rapid is the transition of architectural sentiment, that it would be unfair to speak of almost any houses, though but a few years old, in any other respect than as grounds of experience and criterions of expense."

These minor examples in the book have few or no outbuildings, but the principal design has all the offices required in a complete establishment of moderate extent, including the laundry court, the stable-yard, and the conservatory. The description or discussion of this plan affords occasion for remarks upon style, construction, materials, and cost, enabling the author to scatter with a liberal hand hints and suggestions in favour of elegance, health, and general convenience.

MR. ASHPITEL ON ARCHITECTURAL DRAWINGS AT WINDSOR CASTLE.*

(Concluded from our last.)

AMONG the sketches of Muzio Oddi is one entitled "Façade of the Sanctuary towards the Church." We have no clue to the period, but might infer it was made after his liberation. A rough sketch (p. 21) is given of a tablet to the memory of his father. The inscription is "D. O. M. to Captain Lactantius

Oddi, who when alive was strenuous and upright under every fortune. Mutius and Matteo placed this as an act of piety to their father." Many of the drawings which now follow are more neatly executed, and many have dimensions figured on them, which would lead one to suppose they had actually been executed. They are not only for churches, campanile, and other large constructions, but even for organ cases, brackets, and other ornaments,

and one seems a design for a picture-frame. A large number of them are for doorways, entrance gates, and large windows, and, I think, we must agree, display much ingenuity and boldness of handling.

The second volume commences with plans which seem to have been parts of conventual buildings. Among them is a very curious sketch of the inside of a dome looking upwards, and showing a construction of scaffolding, cords, &c., probably intended, as appears by a section at page 22, to enable the builders to fix the tambour at the top. At page 19, we have an elaborate plan of a large palace, fortified at each angle with a bastion with embrasure for twelve guns each. It in some degree resembles Caprarola in arrangement; but the latter is a polygon in plan, while this is square. This is followed by the plans of the *enceinte* of a large town strongly fortified, with the sections, or, to use the expression of the old engineers, "profiles," of the ramparts. Unfortunately there is no description by which it may be identified. We have three plans, &c., for conventual buildings, one of which is endorsed "A monastery for the nuns of Ancona," and shows our author continued his avocations as an architect even while occupied in military pursuits. We then have the plan of a large amphitheatre, on the back of which are some curious moral reflections on beauty and love. One of them is headed by a reflection, expressed no doubt many thousand times before and since his time, "Amore tiranno." Whether the remembrance of the Grand Duchess gave birth to this expression, we know not. We then have the design for a large window, which, from the inscription, we may suppose to have been put up at Milan in the duomo. Under this, it appears, an altar was intended to stand, which he says was to be conformable to the Altar of St. Joseph. The whole is of marble, and seems of very large size. It would be tedious minutely to describe every item before us. Suffice it to say, we have designs for a chapel, on the back of one of which is written, "Plans of the Chapel of the Pope in the Church of

* A House for the Suburbs, Socially and Architecturally Sketched. By Thomas Morris, M.I.B.A. With illustrative designs. Second Edition. London: Simpkin, Marshall, & Co.

* Paper read by Mr. Ashpitel before the Royal Institute of British Architects.

Minerva," probably Santa Maria Sopra Minerva at Rome; and others for the sacristy at Loretto.

We now get to the designs for fortifying the town of Lucca. Some are marked the "Idea of George Settale, of Milan," while his own is modestly inscribed, "The idea of another without a name," *innominato*. With these are detail drawings of bastions, one with rounded, and the other with square orillons; there are also stairs apparently leading to casemates, or magazines, or other places of safety. We then have a plan of the city and citadel of Casale, on which is sketched in red chalk the approaches of the enemy, and some rough outworks, which seem to infer that he was present and took part in the operations. The mixture of military and civil architecture which follows, shows that Oddi still combined the pursuit of arts and arms; but it would weary you to describe them all. I would, however, call your attention to a very ingenious contrivance for raising and lowering a drawbridge, where the increased weight due to the increased leverage as the bridge descends is compensated by a very clever contrivance, much on the principle of the fusee of a watch. To judge of his abilities in a military point of view, by the knowledge of the present day, would be absurd. The increased power of ordnance, particularly of the mortar and shell, have entirely altered siege operations from the time of Muzio Oddi. He seems to have used both the flat bastion, such as those with which San Michele fortified Verona, and the bastion with a larger capital and sharper angles of Vauban and Cohorn. But he appears to have taken especial pains with his orillons. In his time, cities were often taken by storm, as soon as any breach could be effected, and very often merely by escalade, by coup-de-main. In this case it was very important to be able to get guns to sweep the face of the curtain, and equally important those guns should not be exposed to a cross fire. San Michele put one under another in the orillons, but of course, like all casemated guns, they were annoyed by their own smoke. Oddi placed his side by side. If, however, we judge of his abilities from the honours paid him, and the testimony of his biographers, he must have been a great military architect.

The next volume to which I shall beg to call your attention, is one wholly devoted to the church of St. John Lateran at Rome. This noble building has a façade nearly forty feet wider and thirty feet higher than our St. Paul's, and is nearly eighty feet wider between the clear of the walls of the nave. The old Basilica was destroyed by fire about the year 1350, and was restored by a long succession of Popes, and completed as to its interior by Clement XI., about the close of the seventeenth century. The volume contains a number of plans and sections of the building, boldly and almost roughly executed in pen and ink; these show the present state of the church. It formerly consisted of five aisles, divided simply by immense Corinthian columns, from the capitals of which arches sprang in the old Basilican style. As modern requirements demanded a great number of altars, large piers were constructed, with niches, &c., fitted for that purpose. A great many of the old columns, which had escaped the fire, are said to have been built into these piers. It has, therefore, entirely lost its ancient Basilican character. The whole edifice is enriched with the finest marbles, mosaics, gildings; it is full of noble statues and fine monuments, and is, in fact, second in richness only to that of St. Peter. The book before us is well worthy of inspection, not only to those who have seen the building, but to those who have not. The latter half of the volume is occupied by a most curious subject. It contains drawings for all the ceremonies of a Council of the Church. This, of course, would not be an œcumenical or general council, the last of which, as is well known, was that of Trent, nearly three centuries and a half ago. It is probably a smaller council or conclave. The principal feature in these decorations is an immense tabernacle called a catafalco, which stands over the high altar, and is very richly decorated. It seems to have been surrounded by bas-reliefs, showing the procession and the other ceremonies, the bishops and other dignitaries; some are walking, some sitting at a table, some kneeling at an altar, while behind a sort of screen stand skeletons, which seem watching and mocking their pomp and state. There are plans of the arrangements of the seats, and even of the hangings to adorn the church; and drawings of all necessities, down to the chalice and candlesticks. The benches and chairs are also drawn; one is said to be "for the Pope, made," it tells, "of red brocade, and damasked velvet, with two footstools to match." Another, more curiously, is marked, "Seat of straw, with two cushions of silk;" all have figured dimensions. This volume is probably by Carlo Fontana, as the arms of Clement XI. appear in several places. This prelate came to the papacy in 1700, both Borromini and Bernini then being dead.

The last volume, to which I venture to invite your attention (at least the greater part of it) is superior in artistic execution, and the subjects are of greater interest than those I have already alluded to; although there are others at Windsor possessing still greater claims to your admiration. The volume commences with some extremely well-executed sketches of Roman remains, very carefully outlined and shaded with bistre. They consist of the Arches of Constantine, Septimius Severus, the Goldsmiths, of Lucius Verus, the Porta Maggiore, the Arches of Titus, the remains in the Roman Forum, of that of Nerva, the Baths of Paulus Emilius, the Theatre of Marcellus, the Temples of Fortuna Virilis, Antoninus, &c., the Septizonium, the Pyramid of Caius Cestius, &c. They are very faithfully rendered, and possess the unusual interest of giving some examples which are now destroyed or removed. Thus, the Temple of Pallas, in the Forum Transitorium, was taken down by Paul the Fifth, and the columns now form part of the magnificent fountain called the Acqua Paola. The Arch of Lucius Verus has disappeared. The Septizonium of Septimius Severus has also perished, and nothing is left of it but a heap of old bricks. At first, I thought the drawings were the originals of those given in Gamucci's Rome, but though

they resemble them somewhat in character, all differ more or less, while the larger part differ in toto. One curious circumstance arose during the research, and that led to the inference that they are older than his book, which was printed in 1565. The Arch of Septimius Severus in the latter work shows an excavation round the lower part, by which the pedestals are exposed to view, as they are at present, while in the Windsor MSS. they are drawn as still covered up with the earth.

An examination of Rossi, Sadeler, Du Perac, Defrairius, Gamucci, in fact, of all the authors on the subject to which access could be had in the very limited time I had to prepare this paper, proved these drawings were no part of their works. I therefore took the volume up to the British Museum, the kindness, attention, and courtesy of whose officers on repeated occasions I am proud to acknowledge. Mr. Carpenter, Mr. Rye, and Mr. Bond gave a very long and patient investigation of the subject. The former gentleman said immediately that he thought they strongly resembled the drawings of Jacopo Tatti, whom we know better as the great Sansovino of Venice. Unfortunately the Museum possesses but one drawing from this architect's hands. On comparing it with those before us, there certainly was a very great similarity; the colouring was hardly so warm as these, but that might have been quite an accidental circumstance. The latter gentleman, whom I venture to name, and who, in judgement of the identity and period of handwriting may be considered "facile princeps," also thought the inscriptions as both extremely like. With but one drawing from which to judge, however, it would be much too hasty to pronounce a decided opinion. We all thought, however, we might go so far as to say there is great probability that these drawings are the work of Sansovino, and if that be correct, of course they are of the greatest interest and value.

The remaining drawings in the volume are by different hands, some being very well executed, and some evidently copies of good drawings by inferior hands. In one or two of them the blunders in the perspective are such as none but an inexperienced person could make. On one drawing there is the name of Vignola, but it is not likely it is his. On another is the more likely inscription in Latin, "from the books of Julian Giamberti called San Gallo;" and the drawing may thus be said, either to be by that celebrated architect, or to have been collected by him. The subjects are all Roman antiquities. No. 17 is the so-called Portico of Octavia, in the Peschiera, which is drawn as nearly entire, and the restoration of which differs very little from that of Canina. It is now in a very dilapidated state. Several others may be recognised, as the arch at Verona, and those of Titus, and Constantine, the Baths of Paulus Emilius, &c.; but it is exceedingly tantalising to see several very curious buildings to which we have no clue, and which we suppose must have disappeared. At the end of the volume are a number of plans which seem to suit some of the drawings, and if so, the inscription, "one mile out of Rome," "two miles from Rome," &c., would lead us to think they are parts of the villas, tombs, or temples which some time lined all the roads from Rome, and now are mere heaps of ruin, and having served as quarries for ages to every one who wanted building materials, are now mere heaps of rubbish. The beautiful statues, the sculptured friezes, the marble columns that adorned these buildings, have long ago been burned into lime to fertilise the land; such of the other materials as could be moved have formed wretched farm-houses or enclosures to keep the sheep and goats from the nightly incursions of the wolf. Nothing now remains but such masses of brickwork as are too hard, too rock-like, to be worth the labour of plunder, and which stand up among the vast plains of the Campagna as ghostly relics of past grandeur.

This paper was begun with saddened feelings, and seems to conclude in the same spirit. It is natural it should be so. It might be thought fitting to make further allusion to the great personage who has departed. I cannot but feel that such a course would necessarily revive painful feelings, and that it would be out of place for me to attempt to pronounce anything like panegyric. One thing may be permitted, however, which offers, in some degree, a more cheering retrospect; and that is, that one of the last things the Prince asked for from the library related to these MSS.; and one of his latest wishes was that an opportunity of exhibiting them should be afforded to a body he always held in regard—the Royal Institute of British architects.

The CHAIRMAN said, they had heard from Mr. Ashpitel most interesting remarks; the documents referred to were of vast importance, and, in every sense of the word, deserved the most minute investigation.

Mr. WOODWARD, the Royal Librarian, of Windsor Castle (having been called upon by the Chairman), said he had not the power of adding to the information communicated by Mr. Ashpitel, as his time had been taken up in the arrangement of other portions of the library; but it had afforded him much pleasure to accompany the drawings which were that evening exhibited, and which it was the anxious wish of the late Prince Consort the members of the Royal Institute of British Architects should investigate.

Mr. CARPENTER (of the British Museum) suspected that the earliest drawings exhibited, were by Baldassari Peruzzi, and collected by Serlio.

Mr. WOODWARD said he had hitherto been unable to obtain any satisfactory history of the drawings referred to by the lecturer, but Sir Charles Phipps had promised to allow him to examine the Privy Purse Accounts, which might throw some light on the subject.

Professor DONALDSON said that the great difficulty was to distinguish the individuality of the drawings referred to by Mr. Ashpitel, there being such a similarity in the Italian inscriptions. One of the volumes exhibited that evening from the Royal Library was very precious, because it contained a great number of the monuments we knew, as well as many which had disappeared, and of which we had no records.

In answer to a question from the CHAIRMAN, Mr. ASHPITEL said he had seen and examined the whole of the thirty-eight volumes to which he had referred; and the four which were brought to the Institute were not brought there because they were the most interesting of the collection.

Mr. WOODWARD thought it best to have the four volumes brought first, as he was responsible for the safety of the whole. He had commenced photographing all the most important drawings in the library at Windsor; and if those which had been exhibited that evening should be thought worthy of circulation in that form to the architectural world, he should be extremely happy to take them at an earlier period than he otherwise would have done.

The CHAIRMAN hoped to see Mr. Woodward some other evening, with two or three more volumes of the collection.

Mr. WOODWARD: Most assuredly I shall do so, with much pleasure.

The CHAIRMAN proposed grateful thanks to Her Majesty the Queen, for her permission to exhibit the books shown that evening; thanks to Mr. Woodward, the Royal Librarian at Windsor; and thanks to Mr. Ashpitel, for his extremely amusing and highly interesting lecture.—Carried by acclamation.

Mr. ASHPITEL moved a vote of thanks to Mr. Panizzi, the chief librarian, and the other officers of the British Museum, for their uniform kind and courteous treatment to architects.—Mr. WYATT PARWORTH seconded the motion.—Carried unanimously.

New Member.—Mr. E. Welby Pugin, of Buckingham Street, Adelphi, was elected a Fellow.

The meeting then broke up.

THE TURKISH BATHS, WESTMINSTER.

SINCE the year 1856, when we were told that Englishmen never knew what it was to experience the luxury of a really good bath, there have been several buildings erected, principally in Ireland, to extend the benefits of that great sanitary institution, known by the name of the Turkish Bath. The movement is mainly due to Dr. Baxter, of St. Anne's Hill, Blarney, Cork, by whom it was first practically introduced into the United Kingdom. The Oriental Baths in Victoria Street, Westminster, owe their origin to a number of Irish gentlemen, who formed themselves into a company under the Limited Liability Act; and no better proof can be had of their hearty spirit in the work, than in the fact that they have spent over £25,000 upon its construction.

This handsome building occupies an area of 15,000 sq. ft. with a frontage of 150 ft. The principal entrance consists of a segmental portico of the Corinthian order, and leads to the alcove or office hall, where the tickets to the gentlemen's baths are issued. The main hall stands beneath a dome 30 ft. in diameter, placed at an elevation of 74 ft. In the centre of this hall, which has, from its rich stuccowork, a very effective appearance, a large fountain is erected, in purely Oriental style, around which is placed an octagonal metal stand for the reception of flowers. The floor of this hall is paved with marble, and leads to the principal staircase, which is executed in terra cotta, beautifully embossed. At the middle landing of the staircase, are the apartments of the governors, which command an extensive view of the interior of the building. The second flight at the gallery is supported by handsome scagliola Corinthian columns, the capitals and bases of which are also modelled in terra cotta. This gallery conducts to the several divans of the first-class gentlemen's baths, commodiously and elegantly furnished with ottomans and lounges. These rooms measure 40 ft. by 36 ft., and are divided into compartments by a colonnade of scagliola pillars. A handsome iron staircase leads to the attics, which comprise private dressing-stall saloons, each measuring 40 ft. by 24 ft., which are comfortably fitted up with separate dressing-places. Between these two saloons will be found a large refreshment-room. The ceilings of the beautiful hot rooms are lighted and decorated by means of stained-glass stars of different sizes in primitive colours. The ornamental stucco and terra cotta work in these apartments is very elaborate and effective; the centre screens, diaper walls, and arches leading to the fountain or "douching-rooms" are all finished in the terra cotta which is so abundant throughout the building. The couches and floors are composed of Carrara marble and Minton's pavement, the rooms being so arranged as to accommodate public or private bathers. Descending farther from these chambers by the main staircase to the hall, will be found more spacious divans and hot rooms; the ceilings of the latter are composed of groined arches; and light is obtained through the coloured-glass windows in the gable walls.

It will be almost needless to add, after the above description, that the accommodation given to the bathers is everything that can be desired. The lavatories are elegantly ornamented with marble fountains, and contain materials for "douches" of any required temperature. The ladies' baths are situated at the left-hand side, the entrance being through a side door in the main front, which, however, is distinct from the main porch. A small door at the right-hand entrance of the building leads to a novel acquisition in the shape of horse baths. There are also laundries, drying-rooms, water-works, and basement stories, which contain furnace chambers, coal and coke stores, and the attendants' rooms. We perceive there are additions being made to the back of the building; and the tasteful, yet neat, iron railings in front have only recently been laid down.

ST. SEPULCHRE'S CHURCH, NORTHAMPTON.

THE Church of the Holy Sepulchre at Northampton, built in the time of the Crusaders, has recently been restored under the direction of G. G.

Scott, Esq., R.A. This church is one of the four remaining round churches in this country. The whole of the external restoration has been completed, but the want of funds prevents the committee from proceeding with the internal fittings.

The church consists of the original Norman Round Church, founded about A.D. 1090, the Norman chancel having many centuries ago disappeared, and been substituted by an early decorated chancel with two aisles. This portion having fallen into a dilapidated state, and been much mutilated by successive alterations, and the Round being no longer suitable or large enough for the populous parish to which the church gives its name, it was determined that the chancel should, with its aisles, be extended eastward; and discoveries made during excavations show that it now occupies its original site; the late chancel and its aisles thus becoming the nave for the use of the congregation, together with an additional aisle on the north side destroyed in very ancient times, now rebuilt upon the old foundations, by funds raised by a committee of ladies of the county and town of Northampton. This has, after many years' anxious labour on the part of those interested in the work, been so far carried out, that the flooring and fittings now only remain to be executed.

The new portions are constructed of the red sandstone which is found in the county, the dressings being of red and Bath stone varied. The three chancel windows have detached shafts of red and green serpentine, with richly-carved caps, and the pillars of the chancel arches have also polished granite and Anglesen marble shafts. The apse and chancel will be paved with encaustic tiles, the designs for which have been drawn by the Rev. Lord Alwyne Compton, a nobleman who has taken a very active interest in the restoration. The roof of the apse is constructed of oak, pine, and mahogany, in rich ornamental patterns, Mr. John Watkins, of Northampton, being the contractor for this portion. The carving, the cost of which is provided for by special donations, is being executed by Mr. Farmer, of London. The Round part will, as soon as the restored portion is completed, be cleared of its pews and galleries, and its restoration conducted by a committee of friends of the late Marquis of Northampton, the late President of the Royal Society, as a memorial to him, when it will be preserved as a vestibule or baptistery.

In the early part of the spring, Mdm. Lind-Goldschmidt gave her valuable services to sing at an oratorio for the benefit of this church, which realised £490 net profit. The total cost is estimated at about £6,000, of which we understand £1,500 remains to be raised.

ON THE FORMATION OF A NATIONAL MUSEUM OF ARCHITECTURE, VIEWED IN CONNECTION WITH ITS BEARINGS UPON MEDIEVAL ART.*

(Concluded from page 436.)

IN illustrating Architecture through the medium of a Museum, I should lay down as a primary and fundamental rule, that it must, mainly, and on strict principle be effected by *representation*, rather than by collecting the actual works of art themselves. There are exceptions to this, but in case of each of such exceptions the onus lies upon the collector of proving the propriety and lawfulness of his departure from the rule, and of clearing himself of the charge of encouraging spoliation. Architectural objects belong to their own sites, and even where severed from their actual position in the building of which they formed parts, they ought, as a rule, to be preserved, either on its site or in its vicinity, that their local associations may not be lost.

I call special attention to this, because I fear that a feeling exists in the minds of those who direct our national collections that plaster casts are worthless and contemptible objects, and are almost unworthy of admission; whereas, on the contrary, it is the actual objects of art that demand apology, and I will boldly say that any actual architectural objects in our own Museum I would gladly see returned to more local habitations, if such can be shown to exist; and at the risk of being pronounced a barbarian by the curators of the British Museum, I would almost go so far as to say, that I should feel a satisfaction in learning that the Elgin Marbles were to be restored to their places in the Parthenon, and that our great Museum should be content with casts of those glorious master-pieces of art (though, perhaps, made in some material more durable than plaster).

I will roughly classify the objects to be illustrated as follows:—

I. *Actual Architecture*, by which I specially mean stonework, whether in the form of mouldings, or other mechanically formed details, or of architectural carving.

II. *Sculpture*, forming a part of or intended expressly as an accompaniment of architecture.

III. *Woodwork*, forming a part of or connected with architecture.

IV. *Metal work* belonging to architecture.

V. *Architectural decorations*, whether inlaying, mosaic work, painting, or other cognate form of art.

V. *Painted glass*.

VII. *Pavements*, whether of tile, mosaic-work, or otherwise.

VIII. *Monumental slabs*, whether as brasses, incised, sculptured, or inlaid stones.

IX. *Miscellaneous objects*. Each of these classes includes all its chronological and national varieties.

On the first class (*Actual Architecture*), I will first remark that it is not,

* Paper read by Mr. GEORGE GILBERT SCOTT, R.A., at the Architectural Museum, South Kensington.

as a general rule, necessary to go very far in illustrating its more mechanical forms, such as mouldings, &c., though a collection of them belonging to buildings of different dates would be highly useful. Generally, however, the architect may study these sufficiently from the actual buildings, and their sections can more accurately be represented on paper than in plaster. It is, however, of the utmost importance to obtain casts of them wherever they come in contact with sculpture or foliage, and where they are enriched in any degree by carving. Thus, where a cast is made of a capital, the abacus, a portion of the shaft, and perhaps a short length of the arch mouldings which it sustains, should in many cases be cast with it, so as to illustrate it *as a whole*, and that the art-workman or student may see the carved work in connection with its natural accompaniments. Again, where certain orders or parts of arch mouldings are enriched with carving or sculpture, those not so enriched should be represented with them, that the grouping of the whole should be represented, and the mutual influence of the plainer and more ornate parts one upon another may be illustrated.

I have thought it necessary to premise with what is properly only a matter of detail, by way of limiting the vastness of the field which is open to us; for, so endless is the variety of our style and the richness of its resources, that a collection which would worthily illustrate it would occupy a somewhat inconveniently large space. In forming, however, an architectural museum on a scale worthy of being called *national*, great space is an absolute necessity, and it is of little use to make the attempt without boldly facing this primary fact.

It is known only to those who have for years been in the habit of visiting and diligently studying and sketching from ancient buildings, what an inexhaustible fund of exquisite and ever-varying art we have to draw from, though it is not by any means easy to obtain the specimens most needed. It is, in fact, in many cases only through the intervention of the architects engaged in the repairs, and only when repairs are going on and scaffoldings erected, that the most valuable works in our great buildings can be reached, while in buildings of a humble class it is architects alone who know where such works of art are to be met with.

One great distinction between a national museum, for which considerable funds could be procured, and a private one, like our own, is, that *much larger* objects can be obtained. It is often most desirable to possess casts of entire doorways, or their sculptured tympana, tombs, reredoses, &c., so as to show the work as a whole, instead of in a number of small and disjointed portions. A private society like our own can very rarely do this, but in a museum supported by public funds it would readily become practicable, indeed the largest of such objects would not perhaps cost more than is sometimes expended on a single specimen of majolica.

It is not, however, our own architecture alone which must be illustrated. The contemporary art of other countries has equal demands upon us; nay, in one sense, greater, inasmuch as if our art workmen find it difficult to visit our own architectural monuments, they will find it *impossible* to visit those of foreign countries.

The Gothic architecture of France is the elder sister of our own; and, if not more beautiful, possesses beauties and varied expressions of its own which must ever seem to it the earnest love and devoted admiration of every student of mediæval art. Our own architecture can hardly be correctly understood without a knowledge of that of France. Their origin, development, and history, are so linked and entwined together, that without the knowledge of both, they cannot be fairly studied or appreciated. France, too, took the first place in art, as in arms, amongst the nations of mediæval Europe. Her art productions may, therefore, be viewed as the *normal types* of Gothic architecture, and, as such, they claim a full illustration in a museum of the architecture of those periods, and there is a boldness and nobility of treatment about them which especially commend them to the most diligent study of the architectural student and workman.

French architecture must therefore, in such a museum, be illustrated as fully and as voluminously as our own, nor can I conceive of any field of illustration so glorious or so eminently useful as this.

The mediæval architecture of Germany and of Italy have claims only second to those of France. Indeed, time would fail, to enumerate in the roughest manner the glorious works which should find place in such a museum. They must illustrate each element of architectural ornamentation and detail throughout its chronological course, and through the several countries where our architecture prevailed; giving, however, a due preponderance to the best periods, the best examples, and the countries where the art possessed the finest characteristics.

The period claiming the greatest amount of illustration, at least in northern Europe, may be roughly said to embrace two centuries, viz., the great thirteenth, and a moiety of the preceding and succeeding centuries—that is to say, A.D. 1150 to 1350. Earlier and later periods must be fairly represented, but this interval contains the real vigour, the pith and marrow of mediæval art. Mediæval architecture demands, however, for its elucidation, that certain styles which preceded it—and from which it drew its first inspiration—should also be duly illustrated. I refer to the Byzantine and the Italian Romanesque; each including the branches by which it was led through other countries, and especially through Germany and France, with the changes it underwent by the way. I have taken some pains, in my lectures delivered at the Royal Academy, in 1858, to show how direct was the influence of Byzantine art upon the architecture of France in the twelfth century. The foliage and the figure carving, so well known in the earliest French pointed works of the latter half of that century, are, for the most part, directly derived from Byzantine carving and drawing, with a certain degree of influence from Italy, which was her-

self drawing freely upon Byzantine art. It is clear, therefore, that to illustrate mediæval architecture properly, we must possess ample specimens of these, its parent styles.

The classification of specimens may be divided into those which are elementary, and those which are in a less and in a greater degree combined into complete and applied architectural features. Thus, we must illustrate in its more abstract form the history and progress of architectural foliated ornamentation; showing how it had taken, during the darker ages, that strange form which is sometimes designated as Runic (though whence derived it is difficult to say); how this was long used side by side with foliage derived from debased classic remains; how a distinctly Byzantine tone was imported into the art during the twelfth century, both in France and Germany; how this, in process of time, developed itself into a new and original style of foliage, such as we find in France, England, and Germany, in the earlier years of the thirteenth century; the noblest and the most perfect conventional and architectonic ornamentation which has, perhaps, ever been generated; how, by working this gradually up towards nature, the artists at length fell back implicitly upon nature herself; first using natural foliage of the most exquisite kind imaginable, side by side with the architectonic, and at length to its exclusion; and how, at length, a new and inferior conventionalism supplanted it—a conventionalism of *departure from*, as the other had been one of *approach to*, nature.

In the same manner we must illustrate the accompanying progress in animal and figure sculpture: how the barbarism of the northern nations during the dark ages became gradually enlightened by an infusion of Byzantine art; how this art gradually softened down its rigid severity, and gave way to the noble sculpture of the thirteenth century,—imperfect in academic correctness, but full of noble sentiment and of high aspirations after artistic perfections,—unhappily not at that time fully realised, but which it is *our place*—would that it may be *our lot*—to carry forward to its legitimate results.

Then we must illustrate the history and use of these as applied to architectural features: we must show the historical progress of foliated capitals, in itself a wide subject of historical and artistic enquiry, and of study for our own actual use and instruction. We must, in the same way, show the history of foliated enrichments in mouldings, arches, cornices, and all architectural details to which it is applied; the development and changes in *surface-ornament* of all kinds, and of the union with all these of representations of animal and human life. Then, we must, in larger specimens, show these elementary details combined into greater architectural compositions, and united more directly with figure sculpture. To do this we want, as I have already stated, complete casts of entire doorways, or, where impracticably large, of portions of their arches, of (perhaps) their entire jambs, and their sculptured tympana, casts of celebrated tombs, of pulpits, of fonts, &c. Then, again, we want the history of niches and tabernacle work, itself a most fertile subject, and demanding casts often on a magnificent scale; we want the history of crockets, finials, foliated crestings, and a thousand other architectural elements, which it is impossible in such a paper as this to enumerate. The work before us is a truly glorious one, and it only requires to be taken up in a spirit worthy of its claims, to make the result in the highest degree noble and beneficial. I must, however, add one word: that casts alone will not do all which is wanted: they must be accompanied by photographs, and often by measured drawings.

I will only, however, under the head of actual architecture, mention one other class of objects which would demand house-room within its walls. I refer to those melancholy but invaluable relics of ancient art which exist in our ruined abbeys, and to those in other buildings which are in danger of being destroyed by inevitable decay.

It is the *absolute duty* of an Art Department, whether or not they had contemplated an Architectural Museum, to rescue these exquisite and invaluable works from oblivion, by obtaining casts, photographs, and measured drawings, from them while they yet exist. Every winter abrades their ancient carved surfaces, and brings down, perhaps, larger portions of their sculptured foliage. Those who have been for many years in the habit of sketching from old buildings, see at every visit the progress of destruction which is ever going on, and which is ever accelerating its destructive inroads. A few years more of delay, and these precious works of art will have perished. In the name, then, of art, of reason, and of patriotism, let us delay no longer, but at once obtain perfect representations of what we have left, by means of plaster, of photography, and of drawing, and enshrine them as the most precious relics to be for ever preserved in the archives of our national art! I will add here, however, one word of caution: let a hardening process be always applied to the ancient carved work before attempting to make casts of it, or we may destroy the original while obtaining the copy.

II. What I have said of architecture proper, applies equally to the second head—Sculpture forming a part of Architecture. I will therefore view this as included in the foregoing remarks, only adding, that a collection of the mediæval sculpture of the thirteenth and fourteenth centuries, of France, Germany, and Italy, would be an invaluable acquisition to a National Museum, indeed, would be an absolutely necessary portion of it.

III. *Architectural Woodwork*.—This being much scarcer than stone-work, especially that of the best dates, must be collected with great care. Let me, however, be always understood to mean casts, rather than the actual work, though when this has, unhappily, been severed from its proper position, it will promote its conservation to place it in such a museum.

Of woodwork of the fifteenth century, and later, there is a large supply of casts in the hands of the Government, which were prepared

to assist the carvers employed in the Houses of Parliament. This, however, is by no means the best period. We want woodwork of the thirteenth and fourteenth centuries. This is, in England, somewhat scarce, and wherever it exists, casts should be made from it. Among foreign countries, Germany, perhaps, contains the largest store of ancient woodwork. The stalls at Cologne, not only in the cathedral, but in many of the churches; the wonderful doors of St. Mary's of the Capitol; the stalls, &c., at many churches throughout the length and breadth of the country, should find their representatives in such a museum. The elementary classes of woodwork, and the progressive illustration of their histories, would assume a course quite parallel to what I have shadowed out in speaking of stonework, and it is needless to recapitulate them. The objects, however, themselves, and the art expended upon them, differ considerably from the previous class, and the objects are comparatively so scarce, that there is much more difficulty in obtaining them; and it is only by the help of those who are in the constant habit of searching out objects of study in the most out-of-the-way places that they can be found out. Every year, too, they are getting more and more scarce. Even the few early remains of woodwork in our old cathedrals are diminishing, from the carelessness and want of knowledge of their guardians; let no time, then, be lost in searching out and obtaining perfect representations of those which remain, whether at home or abroad.

We now come to the fourth Class;—*Architectural Metal-work.*

If woodwork of the best ages is so scarce, how much more so is metal-work, and how indescribably important is it that we should use our utmost exertions to collect and to preserve representations of it where it would be improper or impracticable to obtain the reality of what yet remains to us! Here, the departments of art are, as regards the smaller and more movable classes of objects, doing very great things for us: indeed, we cannot be too grateful for the splendid collection of specimens of this and kindred branches of art which is being formed within these walls, nor can we be too assiduous in availing ourselves of the facilities for study which are thus afforded us. These, however, can scarcely for the most part be classed under the head of *architectural metal-work*, though they bear very directly upon it; what I refer to is chiefly of a larger description, such as screen-work, hinges, brass fonts, and lecterns, retabula, coronæ, doors, gates, &c., and the other forms of metal-work brought more immediately into contact with architecture. These, like other architectural objects, are chiefly to be represented by casts and drawing, and these should be, from time to time, made from all the best specimens which remain in this country, and all which we can gain access to abroad. We long ago contemplated obtaining a cast from the truly magnificent brass font and its cover at Hildesheim, but our funds forbade it. There are a great number of such fonts, nearly equally worthy of being represented in our museum, as well as innumerable other objects of all kinds and descriptions. Among others I will mention, though a late example, the exquisite brass genealogical tree which clothes the tomb of Mary of Burgundy at Bruges; and this leads me to call attention to the numerous brass effigies and entire monuments which exist, and many of which would be well worthy to be represented in such a collection. I will also call attention to the most magnificent of all classes of metal-work, the gorgeous shrines of the twelfth and thirteenth centuries. There are some invaluable specimens of the same exquisite workmanship in the museums of the department, and it is possible that a few more may by chance be obtained. The greatest and most glorious specimens, however, of this wondrous art, must ever remain where they now are, and where for the most part they have always been; and can there be only rarely visited and studied. What I wish to press upon the attention of the department of art is the necessity of obtaining perfect full-sized representations of these most sumptuous works. Among the many which exist I will call especial attention to those of the three kings at Cologne, of Notre Dame at Aix la Chapelle, and of St. Elizabeth at Marburg. These are *absolute miracles of art*, and I would earnestly press the necessity of perfect full-sized, and perfectly detailed drawings being made from them, accompanied by some more tangible representations of some of their parts.

But I must go on to my next head—*Coloured Architectural Decorations.* Here, again, we have heartily to thank the Department for much which they have done, and to entreat them to go on as they have begun. They have already collected many drawings of such decorations, with some of the originals. Mr. Octavius Hudson, of whose zeal, knowledge, and skill, I cannot speak too highly, has adopted the excellent practice of having casts made from the details of ancient buildings on which he is engaged, and making upon them fac-simile copies of the remains of colouring which he finds. This, if followed out, would supply invaluable illustrations of decorative art, and I would urge the collection of full-sized drawings of all other kinds of decoration wherever they can be procured. Such remnants of old art are continually being destroyed; how easy would it be to perpetuate them by fac-simile drawings. And thus, of all the other classes of art I have enumerated, let us have coloured tracings of stained glass; not only of famous works, but of the fragmentary remains in village churches; let us have (as in fact we already have to a considerable extent) rubbings of brasses and incised stones; coloured rubbings of ornamental pavements, and perfect representations of all other branches of decorative art. I exhibit a fac-simile copy of a part of the ancient retabulum in Westminster Abbey, as an illustration of the kind of drawing I am recommending. Time will not allow me to go further than to say that a Museum thus constituted would be worthy of being called "national," and would not only be the greatest benefit which could be conferred upon our art, but would be no

more than the carrying out to its natural results of what the department have already commenced.

It may be feared by some, that such a collection would encourage slavish copying. My own experience has led to a contrary opinion. I have observed with pleasure that, so far from this being the case, the increased study of ancient examples leads the art-workman to a more enlarged and more reasoning appreciation of his art, gives him greater freedom in the exercise of it, and, above all, leads him to a more zealous and intelligent study of nature. I will only add two more suggestions. 1st. That as such a collection would not be made for a mere spectacle, but for actual use, it should not be deposited in vast and imposing halls and galleries, but should be so subdivided as to give the student every possible facility for quietly studying any one department, which he might be pursuing without the distraction which the enormous multiplicity of the objects would otherwise occasion. In reading a book we should be sadly annoyed if we were obliged to see a number of its pages, or its illustrations, at once; and so it is with a museum; the student only wants to see the part to which his studies are directed. 2nd. I would suggest, as South Kensington is not a place very accessible to the student or the art-workman, that a system be organised of lending out objects to particular districts, in which rooms for the studies of art-workmen shall be opened, and that the specimens so lent shall be changed periodically (perhaps every month), and thus a constant and ever changing course of study facilitated.

I will now conclude by suggesting some points for consideration as to how our great work can be carried on with the greatest possible advantage to the great cause we have in view.

There are two parties to this undertaking. The representatives of the demand and of the supply, and it can only be successfully carried out by their hearty and continued cooperation.

The representatives of the demand are *the architects*. It is not their personal interests in the least degree which are at stake, for buildings would be erected and architects employed and paid just the same, whether the arts subsidiary to architecture are cultivated or neglected; nor can the demand be said to come mainly from the art-workman himself, though it does more nearly affect his personal interests. Those among them whose apprehensions of art have been aroused to activity, join heartily and earnestly in the demand; but, as in the case of religion, those who most need instruction are the least alive to their necessities; and among architects themselves, it is those who most keenly appreciate the nobleness of their art, and have best cultivated it as a *fine art*, who most strongly feel the necessity for aiding the art-workman, on whom depends the realisation of the more artistic portions of their designs. Not only, however, are the architects—and the best among them—the representatives of the demand, but they are also the parties who best—I might almost say, who *alone*—understand what is the nature of that demand; who know, from their daily experience, what are the objects necessary to meet it; and who, from their own travels, their own studies, and from the contact in which their practice places them with ancient buildings, know, also, whence and how those objects are to be supplied. It is, therefore, self-evident, that the aid of the architects most conversant with the subject is essential to the success of the effort; and when we add to this, that those architects have already, by their own individual exertions and of their own free motion and sense of the necessity, most efficiently launched the work and founded an Architectural Museum which must be the nucleus or the model of whatever is effected, the case is rendered still more obvious.

The representatives of the supply are the *Government Department of Art*. To them has been committed that great cause, the promotion of *applied art* in this country.

The Museum of Objects of Art which they are forming, must, of necessity, be of the greatest benefit to this object. It brings within the reach of the manufacturing art-workman the finest objects for his study, such as he could otherwise never have hoped to gain access to. What we ask of them, then, is to aid us and work with us in doing the same for the *architectural art-workman*, who equally needs, and equally deserves, their aid.

If they will not do so, or if in doing so they refuse the aid and advice of those who alone understand what is needed, the world and posterity will know on whose shoulders the onus will lie. If, on the other hand, they appreciate and frankly acknowledge this, perhaps the highest of their duties, they will merit the eternal gratitude of every lover of art; and I am sure that I utter the feelings of my brother architects, when I say that we are prepared to abdicate our self-imposed task in their favour, and to unite with them heart and soul, and without jealousy or rivalry, in carrying out the most noble and most useful work.

The exact regulation under which this united action will be best effected I will not here attempt to define. "Where there is a will, there is a way;" and I content myself with asserting that, on our part, at least, there is a hearty good will, and that I see no difficulty whatever as to the way.

LEVIATHAN ESTABLISHMENT AT SYDNEY.

PROBABLY one of the largest furnishing establishments out of England is that which has recently been erected at the junction of King Street and Castlereagh Street, Sydney. The premises in question comprise, with adjoining timber yards, an area of 42,370 square feet. Thus nearly an acre of ground is occupied for business purposes. On the basement there are extensive timber yards, with saw-pits, turners' shops, show-rooms, and stores for floor-cloth, besides painters' and decorators' workshops,

stables, &c. It is intended to erect large steam saw-mills for the purpose of cutting up the timber used in the manufacture of furniture. The principal show-room is on the ground floor, the entrance to which is from Castlereagh Street, and its length is 265 ft. with an average width of 30 ft. This spacious apartment is filled with every description of cabinet work and upholstery, decorative painting, carpets, pianofortes, chimney-glasses, chandeliers, Gothic church furniture, altar chairs, &c. &c., imported principally from England, France, and Germany. The first-floor is fitted up also as show-rooms, which contain wooden and metallic bedsteads, bedding, and every variety of bedroom and other furniture. Adjacent to the show-rooms are the spacious workshops, in which some sixty hands are constantly employed. Among these are cabinet makers, turners, French polishers, and other artisans occupied in the various branches of furniture manufacturing.

Mr. Lenehan the proprietor, contemplates the erection of a handsome entrance to his show-rooms from King Street, and Messrs. Burnett and Co., of Deptford, have been applied to for an estimate for the construction of a very elegant shop front fitted with their patent iron shutters to protect the plate-glass windows, which are to be formed of sheets 12 ft. by 7 ft.

Notwithstanding the large space at present occupied as show-rooms, these are frequently so crowded with purchasers and lookers-on, that Mr. Lenehan intends to cover in one of the adjoining yards with an iron and glass roof similar to those of some of the railway stations in England. When this shall have been completed, it will form the largest hall in any of the colonies. Its dimensions will be 200 ft. in length, 50 ft. in width, and 30 ft. in height. A gallery, supported by iron columns, will run round the sides and ends of the interior.

ITALIAN SCULPTURE OF THE MIDDLE AGES.*

APPROPRIATELY bound in vellumised white cloth and gold, and admirably printed and illustrated, Mr. Robinson, at the instance of the Science and Art Department of the Committee of Council on Education, has furnished the public with a catalogue of the works of Art at the South Kensington Museum comprised in the section to which the title of the volume refers. Without tracing, as we are almost tempted to trace, the history of sculpture from those early and obscure periods of time, when the imitative faculties of man first prompted him to copy in plastic materials the forms and shapes of animate and inanimate objects around him, we may at once come to the era in which the revival of the glorious art took place in Italy. The word "revival" betokens clearly enough the fact, that sculpture had suffered, from various causes, a declension and decay. This was so indeed with the Fine Arts generally. Efforts had been made, it is true, by Charlemagne and others, to arrest the downward progress of art, but individual efforts, unsupported by the taste or appreciation of the people generally, were not likely to succeed, and they did not. To the monks of the early Greek and Latin Churches is due the fact that art in those ages was kept in existence, and it is some satisfaction to be able to say, that if they purposely obscured the refulgent rays of pure religion with the murky clouds of superstition, they at least fanned the dying embers of the art fire, and thus saved it from extinction.

It is customary to date the revival of art in Italy at about the tenth or the eleventh century. Flaxman, however, goes much farther back. He dates it from the days of Constantine, and when Christianity became the religion of the Roman Empire. This is a question into which there is no need for us at present to enter, especially as the author of the work under review commences his labours at the thirteenth and fourteenth centuries of the Christian era. It is unquestionable, as Mr. Robinson remarks, that during the middle ages, all the western countries of Europe produced remarkable works of sculpture; but it was in Italy alone that the art attained to a perfection worthy of comparison with the antique, and in Italy alone could its monuments be thoroughly studied. In their nature, works of sculpture usually partake more or less of an architectural or monumental character, and happily a large proportion of the master-pieces of the great Italian sculptors still remain in the churches and public edifices, for which they were executed. To this day, none of the great continental museums or galleries have any systematic collections of *renaissance* sculptures. Even in Florence, which may be termed the Athens of the revival, only a few marbles and a more numerous collection of bronzes are to be found dispersed amidst the vast galleries of the Uffizj; whilst in England, until very recently, the art-student must have sought in vain for any examples of Italian sculptures. For this, and for other obvious reasons, during the last few years, efforts have been made under successive governments to secure for the South Kensington Museum such works of mediæval sculpture as were to be obtained, and especially in Italy. To this object we know that the late Prince Consort devoted much attention, and it is only just to Mr. Robinson to say, that to his enlightened research and active exertions this country is now in possession of a very considerable proportion of the specimens of Italian sculpture which had for years been accumulating in the hands of dealers and private possessors.

No doubt the cost of the collection, which has with so much assiduity and judgment been arranged at South Kensington, has been great; and some may take exception to this mode of expending the public money, but it can scarcely be doubted, we think, that the return will be more than commensurate with the outlay.

As this country has taken so paramountly the lead of all others in what may be termed the useful arts, there is surely no good reasons why it should not endeavour to rival, if not to excel, also in the domain of the Fine Arts. To accomplish this is a truly national and patriotic work, and the surest means for effecting it is to furnish students with the choicest models for examples. Prior to the assembling together of the magnificent pieces of sculpture in the Fine Art Section of the Museum at South Kensington, it was necessary for a would-be sculptor to make a tour through the cities and towns of Western Europe, in search of standards for imitation and subjects for study. This course was attended with a considerable sacrifice of money and time, and too often was impossible of accomplishment. In how many instances was it not the case with young, enthusiastic, and talented artists, that:

"Chill penury repressed their noble rage,
And froze the genial currents of their souls."

As it is, there is a fair field for exertion, and fair incentives are offered to

GEOMETRICAL ELEVATION OF THE TRIBUNE, OR CAPPELLA MAGGIORE, OF SANTA CHIARA, FLORENCE.

emulative ability. Why should we not hope, that from such a school pupils may arise whose fame will, in after times, equal that of the Pisani, Lucca della Robbia, Lorenzo Ghiberto, Michael Angelo, or Cellini?

It is time, however, that we referred more directly to the contents of the Fine Art Section of the South Kensington Museum, as represented by the catalogue which has induced the foregoing remarks. The foundation of the sculpture series of this section may be considered to have been laid by the

* Italian Sculpture of the Middle Ages, and Period of the Revival of Art. A Descriptive Catalogue of the Works, forming the above Section of the South Kensington Museum. By J. C. Robinson, F.S.A., &c. &c., Superintendent of the Art Collections of the South Kensington Museum. London: Chapman and Hall, 153 Piccadilly, 1862.

purchase, in 1854, of the "Gherardini Collection," consisting of thirty original models, by great Italian artists. These were allowed to remain for a considerable time at Marlborough House. On the subsequent rapid development of the Art Museum at South Kensington, however, it was seen that works of the class named were directly related to the varied gatherings at that place, of Italian art, the majolica wares, decorative bronzes, carved furniture, mosaics, enamels, &c. &c., and to it the Gherardini Collection was removed. In 1859—60 many acquisitions were made in Italy, and the purchase finally, of the Gigli-Campana Collection, brought the series to its present state.

The Pisani are the first sculptors whose works are referred to and illustrated in the catalogue, and justly so, for, as Mr. Robinson asserts, in reference to one of them, Nicolo, that he was "the earliest mediæval sculptor whose name, universally celebrated in his own day, has descended to the present age with undiminished lustre. For many centuries before his time, all representations of the human figure were either very barbarous, or were of the monotonous and corrupt style; which being the result of the gradual decline of antique Roman art, was finally, towards the ninth or tenth centuries, reduced to an unchanging system by the Byzantine artists." Two illustrations, well executed, serve to show the merits of the Pisani. One of these represents the marble statue of an archangel, one of a group of two archangels and three saints, which formed, originally, the angle-piers of a pulpit. The other engraving exhibits an alto-relievo in marble; subject, the Salutation of the Virgin. The original formed, probably, the frontal of an altar. They are both admirable works, and demonstrate the skill of the artists. Reference is made to other works of the Pisani family, as well as to those of Andrea Pisani, who was not related to, though contemporary with them.

Advancing from the thirteenth and fourteenth to the fifteenth century, we come to the works of Jacopo della Quercia, Lorenzo Ghiberti, Donatello, Antonio Rossellino, Desidero, Antonio Gamberelli, and others of more or less celebrity. These are all dealt with by Mr. Robinson in a manner which speaks eloquently of his fitness for the onerous task he has undertaken and successfully accomplished. Their *chef d'œuvres* are illustrated, and brief biographical notices of the sculptors are appended. If in the space at our disposal it were possible to refer individually to the works of these eminent

men, it would certainly be a pleasing duty to do so. They were the pioneers of the glorious band of revivalists in art whose names and memories should be enshrined and honoured by architects and artists "to the last syllable of recorded time." As it is, we must dismiss them, and commend those who are desirous of learning more of them to the specimens of their labours which now happily enrich the Museum at Kensington, or to the catalogue which chronicles their merits.

Of the Florentine school, which may be said to have flourished in the

fifteenth and sixteenth centuries, Mr. Robinson furnishes us with a fine illustration, and which we transfer with pleasure to our own pages. This consists of a geometrical elevation of the Tribune, or "Cappella Maggiore" of Santa Chiara, Florence.

"The ancient convent of Santa Chiara, in the Via Santa Maria, Borgo Santa Spirito, Florence, was suppressed early in the present century; but a part of the Church, comprising the *Cappella Maggiore* or choir, and a small portion of the nave in front of it, was retained as an oratory down to the year 1848. * * * Subsequently, from want of funds, the services in the oratory were abandoned, and it was desecrated and converted into a sculptor's studio. A speculator, aware of the treasure it contained, became the purchaser of the *Cappella Maggiore*, and turned his attention to the sale of its decorations. Attempts were made to save it to the city of Florence, but they failed—fortunately for this country—and in the winter of 1860, 'the right of removing all such portions of the edifice as might be deemed desirable was acquired for the Museum.' Fortunately, again, the nature of the building admitted of the removal of all the portions necessary to its reconstruction. The ashlar stone facings of the interior of the edifice, together with the marble high-altar, have accordingly been

TADERNACLO IN CARRARA MARBLE. ANDREA FERRUCCI.

brought to England; and it is proposed to rebuild the work precisely as it formerly stood. As an opportunity so favourable for architects and artists to inspect the veritable structure will soon be given, it is not desirable that we should go into further detail respecting it. It would be ungenerous not to state, nevertheless, that the *Cappella Maggiore* is the joint work of four great Florentine sculptors, namely, Desidero da Sittignano, Simone Pollaiuolo, Andrea della Robbia, and Leonardo del Tasso, to whom, says our author, should be added, as the master-

mind from whom the idea of its erection indirectly proceeded—Fillipo Brunellesco.

Passing by other immortal workers and their almost immortal productions we reach at length Andrea Farnucci; and, as a proof of his claim to honourable mention among the other great spirits in whose company he is found, we append an illustration of his choicest work—a *Tabernacle*, or *Ciborio*, in Carrara marble.

The elaborate beauty of this we need not descant upon: for the engraver has successfully transferred it for the advantage of our readers. The height of the tabernacle is 5 ft. 6 in., and its width 2 ft. 6 in. It consists of a shrine-like frontispiece, with a door in the centre. This originally afforded access to a cupboard in the wall. The gilt bronze door is perfect, and is engraved with a half-figure of our Saviour standing on the sepulchre. Two pilasters, carved with festoons and clusters of fruit and flowers, flank the sides, and uphold a semicircular pediment or lunette, in the centre of which stands a figure of the infant Saviour, in full relief, and surrounded by foliated ornaments. The tabernacle is supported beneath on a triangular bracket, decorated by an eagle, with outstretched wings, and a shield of arms, festoons, &c. This specimen was brought from the Church of San Girolamo at Fiesole.

Following the course of time, and taking admirable note of the sculptors who from the sixteenth to the close of the seventeenth century distinguished the country which gave them birth, does Mr. Robinson proceed, and his work thus becomes an illustrated epitome of the history of the fine arts in Italy. It is long, indeed, since so valuable a catalogue emanated from the press, and its author—for although his work is modestly designated a "Catalogue," we cannot say its compiler—is entitled to the warm thanks of all who have an interest in art, or an aspiration for the honour and welfare of his country. It is impossible to rise from the study of such a work without feeling one's self elevated, purified, and, as it were, carried back in imagination to those days when, in truth, intellectual giants existed in the fair, and, thank God, now *free* land of Italy.

We unreservedly recommend the work under notice to the attention of all who are engaged in the ennobling study of sculpture and its sister art—architecture.

BUILDINGS IN SCOTLAND.

(From an Edinburgh Correspondent.)

NEW FREE CHURCH AT IRVINE NEAR GLASGOW.—The design of Mr. F. T. Pilkington, architect, of Edinburgh, having been selected through competition for the above church, the work will be commenced immediately. Approaching Irvine by the Railway from Glasgow, the tower and spire which rises to the height of 120 ft. will be seen to great advantage. The tower consists of a lower stage, 76 ft. high, in front of which is the main entrance, consisting of an archway, richly carved and foliated on the under side. The porch gable is filled by geometrical figures, in stones of different colours. There is a rich cornice at the top of the lower stage of the tower. The upper stage of the tower is 44 ft. high, and is octagonal, having four sides occupied by two light windows, surmounted by very acutely pointed gables, filled with various coloured stones. The other sides of the octagon are occupied by pinnacles. Both the gables and the pinnacles rise above the spire tables, so as to soften the junction of the tower and spire.

Halfway up the spire there are four gables, with ornamental openings. The foot of the west gable is an arcade, consisting of one large centre arch, with two smaller arches on either side supported by clustered columns. By means of this arcade, access is obtained to the higher elevation of the church. Over the two sides of the arches are two two-light tracery windows, springing from a richly carved cornice; above this is a rose-window, 20 ft. in diameter, canopied over by a foliated arch above the arch; the gable is filled up with rays of coloured stones—the green, white, and red stone of the district; each ray is disposed in geometrical patterns. This gable to the top of the finial measures 99 ft. high. On the south-west corner, grouping along with the tower and the west gable, is the arcade, continued along two sides of the church.

Above the arcade, which at this corner is circular, the session-house is placed, surmounted by a slated spire; on either side of the body of the church is an octagonal apse, 68 ft. high, the north and south facets of which are occupied by a large trefoil arch, containing a two-light window and a vesica. The sides of the church are occupied by three-light pointed windows with double columns. On the north side, which is also seen from the railway and the bridge, there is a vestry, surmounted by a slated spire in two stages, rising to the height of 61 ft. At the east end of the church is to be a large schoolroom, in keeping with the general design of the church, and capable of accommodating about 300 children. The church is to be seated on the ground floor for 600 persons, and the gallery at the west end of the church is to accommodate 150, making a total of 750. The session house is so arranged that when there is a crowd, it can be thrown into the church.

The roof is to be an open timber one, and the height from the floor to the ridge is 51 ft. The cost of the building is estimated at £4,000, and the mason work has been contracted for by Mr. Wilson, and the carpentering by Mr. Wright. The church is expected to be completed early next year.

NEW BUILDINGS IN WEST REGISTER STREET, EDINBURGH.—A large and handsome building is in course of erection in the above place, which is now

raised up to the second floor. The building consists of three flats, surmounted by a mansard, in which there will be one full flat, and an attic or half flat, the whole rising to the height of upwards of 60 ft. The façade to West Register Street is about 46 ft. in length, and the north façade is 65 ft. in length. The first, or ground floor is to be occupied as a show-room by Messrs. Hume and Co., plumbers and gasfitters, and consists of openings, divided by small piers, with archivolts and vermiculated key-stones. The windows of the third floor will have moulded architraves, with retrieves, and are to be divided by pilasters with bases. Above these is a massive and highly ornamented cornice, finished with an ornamental rail, at the base of the mansard. The mason work is being executed by W. and D. McGregor, and the work is so far advanced that it will be ready for the roof in about five weeks, but the premises will not be fully occupied till the early part of next year.

NEW TOWN HALL, PORTOBELLO.—The plans for the proposed new Town Hall have been prepared by Mr. David Bryce, architect, Edinburgh, and approved of by the Building Committee, and the estimates are now being taken for the erection of the building, which is to be of the old Scotch baronial style, and will prove a handsome addition to the street architecture of the burgh. The work will be commenced as soon as the estimates are settled upon, and it is expected that the foundation stone will be laid early in the season, with full masonic honours. Communications have been entered into with his Grace the Duke of Atholl, grand master of the lodge of Edinburgh, to lay the foundation stone towards the end of July next.

ARCHITECTURAL ASSOCIATION.

A MEETING of this body was held at the rooms, 9 Conduit Street, on Friday; Mr. A. W. Blomfield, M.A., in the chair.

Professional Charges and Practice of Architects.—Mr. PARAIRE remarked, that the document recently agreed to by the Institute of British Architects, respecting the Professional Charges and Practice of Architects, as it bore very particularly upon the profession, should be well considered. At the present time the public generally were not aware of what constituted the duties of an architect, and in many cases thought architects made charges which they were not entitled to do. And as the document to which he referred came from the leading architects of England, he thought it should be made more public than it had yet been. This was a matter of very serious importance to the profession. Mr. PARAIRE thought the members should, in the meantime, carefully study the professional charges, and at some future time he should draw the attention of the Association to the subject.

Office-bearers for the ensuing year.—Mr. Ridge and Mr. Walter were appointed scrutineers of the voting papers for the election of office-bearers for the ensuing year. At the close of the meeting the following gentlemen were declared to have been elected:—*President*, Thomas Blashill; *Vice-President*, R. Norman Shaw; *Ordinary Members of Committee*, Messrs. Blomfield, Bunker, Spiers, Lewes, Tarver, Goodman, Paris, Paraire, New, and Gritten; *Honorary Treasurer*, Charles J. Adams; *Honorary Solicitor*, Francis Truett; *Auditors*, J. W. Penfold and J. M. Rickman; *Curators*, C. H. F. Lewes and J. W. Walter; *Honorary Secretaries*, Charles J. Adams and H. Attwood Reeves.

Restoration of the Chapter House of Westminster Abbey.—The CHAIRMAN said, he had to announce the receipt of a letter from the Committee for the Restoration of the Chapter House of Westminster Abbey, inviting members to sign the memorial to the Government in favour of the restoration being effected at the expense of the country, instead of by private subscriptions. The memorial was numerously signed in the course of the evening.

Visit to Westminster Abbey.—The CHAIRMAN said, he had the pleasure of informing the meeting, that Mr. Roger Smith and himself called upon Mr. Scott, respecting the proposed visit to Westminster Abbey by the members of the Association. Mr. Scott at once undertook to accompany the members of the Association over the Abbey on Saturday next (to-morrow), the party to meet in the cloisters at 3 o'clock. The Very Rev. the Dean had given his full consent to the scheme. The members, especially the younger ones, should bring note-books with them, for the purpose of taking down any remarks Mr. Scott might make during the visit, particularly with reference to future sketchings of the building. Mr. BLASHILL said, he thought those members who missed this opportunity of visiting the Abbey would much regret it afterwards.

It appeared, from a letter sent to the meeting by Mr. Roger Smith, that a prize—a copy of Mr. Scott's work on Westminster Abbey—is to be given to the member who shall write the best account of the visit to this renowned structure; the papers to be sent to the honorary secretaries of the Association on or before the 1st of September; the prize to be awarded at the opening meeting of the next session; and the judges to be chosen at the Abbey from amongst the members present.

ANNUAL CONVERSAZIONE OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE entire suite of rooms occupied by the Royal Institute of British Architects, as well as the adjoining Architectural Galleries in Conduit Street, Hanover Square, on Wednesday night presented a gay and animated scene, by the presence of a brilliant assemblage of ladies and gentlemen, on the occasion of holding a second annual *Conversazione* of the leading archi-

tectural body of the kingdom. The first meeting of a similar character was held in July last, and was attended with marked success; this year the *réunion* has been no less prosperous, although probably the paintings, curiosities, and articles of *vertu* exhibited, were not so numerous, no doubt owing to the superior claims of the Great International Exhibition at South Kensington. The display, however, was worthy of the occasion, and of the distinguished professional body in whose honour it was elicited. Last year the greatest personage in the realm, and her royal husband, the great patron of art, sent munificent contributions to the art-display of the first *Conversazione*; this year the widowed Queen, not forgetting the great interest the late lamented Prince always took in the welfare of the Institute, gives a renewed token of her gracious condescension, by the contribution of many valuable antique drawings. Multitudes of other friends and well-wishers of the Institute and of architecture, and the fine arts generally, were not idle, and the result was that the second *soirée* was a complete success. The whole of the rooms were decorated in a superb and tasteful manner, under the management of Mr. Chaffers, of Fitzroy Square (whose skill and experience in the arrangement of works of art are well known), assisted by the honorary secretaries and several other members of the Institute. There were exhibited paintings in oil and water colours, embracing portraits, landscapes, &c.; statuary, engravings, ivories, photographs; autographs; antique vases; gold, silver, and mixed plate; drawings; sketches; ancient and curious cups, of various kinds; antique tapestries; terra cotta figures; ivory figures on stands, and ivory figures on horseback; old ruby-glass vases, silver mounted; silver dishes; Indian vases; tortoiseshell and pearl boxes; old buhl brocket; a pair of bronze-winged griffins; an ivory tankard, silver mounted; curious candlesticks; coral; specimens of work from Dresden, Sèvres, Limoges, Abruzzi, and Venice; ivory chapel; friezes, bas reliefs, work in plaster, medallions; silver chalices, patens, tankards; case of illuminations; wood carvings; illuminated missals; Wedgwood ware; a silver-inlaid hookah; carvings in ebony; daggers; pieces of needlework in frames; carved ivory horn; ivory drinking-horn, with hunting subjects; views of Indian temples and costumes, &c. &c. In the west gallery, the Welby Pugin Collection of sketches and drawings ornamented the walls, as well as a large number of antique portrait engravings, from a variety of sources. On a table in the centre of this gallery were shown, by Mr. John W. Brett, beautiful works in cameo, bronze, and a number of vases in antique marbles, including Rosso antico, Giallo antico, porphyry, sienite, serpentine, grand antique, verd antique, &c. In the Great Gallery were the drawings and sketches shown at the Architectural Exhibition, with the addition of the famous sculptural drawings in the classic style, by Flaxman, and some beautiful specimens of tapestry of the fifteenth and sixteenth centuries. The East Gallery contained many encaustic tile, and other decorations. In the lecture-theatre of the institute, Mr. John Webb exhibited a most interesting Gothic cup, of mixed gilt metal, representing a citadel; Mr. John Norton, original drawings, consisting of architectural compositions by Michael Angelo, Sir Christopher Wren, Sir James Thornhill, and Titian; and drawings of the Clereaux; Mr. Thomas Woolner, a marble bust, and some animals beautifully executed in bronze; there were also exhibited in this room some valuable pictures by Turner, Holman Hunt, Arthur Hughes, and John Milais. Mr. J. P. Seddon contributed to this room his brother the late Mr. Thomas Seddon's picture of the "Pyramids," a duplicate of his picture of "Jerusalem" (a work of art purchased by the National Gallery), and pictures by the same of the interior of a room at Cairo, and of the Mountains of Moab; and another work of art, representing Giotto painting the portrait of Dante, by D. G. Rossetti. Her Majesty contributed thirteen drawings of ancient buildings, including one on vellum (by Inigo Jones) of Whitehall Palace, and several of the Coliseum at Rome, the Farnese Palace, &c.

The hall and staircases were ornamented with flowers, evergreens, statuary, &c.; and in the course of the evening tea, coffee, ices, and other refreshments were supplied to the visitors. About 1,500 invitations to the *Conversazione* were issued by the Institute.

Amongst the contributors of the articles exhibited were:—Her Most Gracious MAJESTY THE QUEEN; the Hon. Emily Eden, Mrs. L. H. Michael, Mrs. Manson, Miss A. Manson; the Marquis D'Azelegio; Lord Auckland; Mr. Tite, M.P.; Mr. Frederick Davis, Mr. G. J. Mair, Mr. John Myers, Mr. Tebbs, Mr. P. Norton, Mr. J. Norton, the Arundel Society, Mr. T. H. Wyatt, Mr. T. Whitehead, Mr. Thomas Keble, Mr. W. Carr, Mr. Durlacker, Messrs. Farrer, Mr. J. P. Seddon, Mr. John Webb, Mr. Morton Edwards, Mr. Rogers, Mr. Bellamy, Mr. E. Sampson, Mr. G. P. Boyce, Mr. T. Roger Smith, Mr. J. Livock, Mr. William Essex, Mr. Woolner, Mr. H. B. Garling, Mr. E. J. Kentze, Mr. William Simpson, Mr. Edward Davis, Mr. John Leighton, Mr. Albert Way, Mr. M. Digby Wyatt, Mr. John Papworth, Mr. H. G. Bohn, Mr. A. J. B. Beresford Hope, Mr. John Henderson, Mr. May, Mr. Thomas G. Keble, Mr. R. Helbronner, &c.

STUDIES OF MODERN ARCHITECTURE AT HOME AND ABROAD.

By G. R. BURNELL, ESQ.

From "ARCHITECTURE OF THE VICTORIAN AGE."

(Concluded from page 447.)

THERE are two important remarks to be made on the subject of the want of taste which characterised the English Architecture of George IV.'s era, and of the dawn of the revival of mediæval art throughout Europe.

The first is, that it rarely happens that the nations which occupy distinguished places in the world's history as guides and rulers in political affairs, are at the same time remarkable for the excellence or the originality of their arts; and that, whenever one of those social revolutions occur by which the external characteristics of a nation are altered, it is heralded by a literary movement preceding the artistic one. The second is, that the change of taste, feelings, and opinions which accompany these revolutions (or *palingenèses*, as Ballanche calls them), only exhibit themselves in the art productions of the successors of the generation which immediately works out the moral problems on which those revolutions depend. Thus, the old Romans avowedly claimed credit to themselves for the possession of the power of conquering the world, whilst they admitted the superiority of the Greeks in the arts which refine and adorn life—or, as Virgil said—

Excudent alii spirantia mollius æra,
Tu regere imperio populos, Romane, memento!

and the brilliant periods of the Medicean and of the Louis XIV. ages corresponded but too closely with the moral degradation of the nations amongst which they arose. Ampère also acutely remarks, that even modern Rome herself, at the period when her influence was the most decidedly moral, did not produce any great artists in her own district, but was compelled to seek her architects, painters, and sculptors at Florence, Urbino, Bologna, &c. Again, it was amongst the contemporaries of Boccaccio, Petrarca, Giotto, and Brunelleschi that the movement in favour of classical art and literature commenced, to be worked out by the Bramantes, Michael Angelos, Filieaias, and Bambos of a future generation; just as Sir W. Scott, Victor Hugo, Schlegel, Savigny, Pugin, Lenoir, Schinkel, Boissée, Manzoni, &c., the leaders of the intellectual movement of the period between 1814 and 1830, paved the way for the technical revival of the mediæval feeling of later dates. In both these cases, however, the literary and scientific revival preceded the artistic one; and the intellect of the age had assumed a marked tendency, men's minds had been resolutely turned towards certain idols for many years, ere the more material arts assumed the expression of the prevalent modes of thought. It would seem that it requires a longer time to discipline the faculties which are brought into play in the production of works of pictorial, sculptural, or monumental art, than it does to discipline the poetical or the philosophical faculties; and it actually did happen that the romantic school established its power and influence, carrying the European mind back to the study of the middle ages, several years before artists or architects dared to cast aside the traditions of the classical schools in which they had been educated. Between 1814 and 1830 the prevalent styles of art in France and in England differed but little from those of the antecedent period; but when the generation educated under the influence of the ideas fermenting, as it were, at that period, came upon the stage of active life, their hopes, aspirations, and day-dreams found vent in the productions of their hands. Some of the architects of the period above named did, it is true, attempt to adopt the *Gothic* style, as it was still called; these works at the present day are bitterly criticised by the students of archaeological details, and, indeed, they were very ludicrous affairs in many instances; but they as often display the existence of the same description of sentiment—of the same mental idiosyncrasy—as the one which had inspired the middle ages themselves, when examined by those who can look beyond the character of a foliage decoration, or the profile of a moulding, into the deeper spirit of the inspiring genius of the whole of the respective monuments.

It is desirable to dwell upon these considerations, because there is a tendency at the present day to confound the ideas of national taste and of national prosperity, and to regard the refinement of the one as the necessary predecessor of the other. History would appear, however, to teach another lesson, and hitherto the nations which have turned to the excessive cultivation of their artistic fancies, have witnessed the decline of their moral virtues, and consequently of the elements of their power and political superiority. There are dangers in the excessive development of any order of faculties to which the students of fine arts, from the very nature of their pursuit, are especially exposed, on account of the imaginative character that pursuit is likely to foster. In the body of the nation itself, when the arts are more than usually cultivated, somewhat of the same phenomenon occurs, and the refinement and luxury thus expressed lead to a morbid and effeminate delicacy of thought and feeling directly opposed to the manlier and higher order of mental character. The state of English and French architecture in the respective periods between 1800 and 1814, and of 1814 and 1830, seem to illustrate, in a partial manner, these views; and decidedly inferior as our schools of architecture then were to those of our neighbours, it may fairly be questioned whether our very deficiencies were not indications of the prevalence of a healthier tone of the public mind than could be discerned in the more artistic productions of our neighbour. The buildings of the later period of the Georgian era were, no doubt, singularly devoid of taste, and they did not indicate any deep or sincere faith on the part of their authors; but in these respects they stood in marked contrast with the productions of the followers of other arts and sciences of their day; and thus must be considered to mark simply a transition state in their own particular walk. It could not be, that the epoch and nation which could boast of such men as Playfair, Dugald Stewart, Reid, Byron, Shelley, Wordsworth, Southey, Coleridge, Lamb, Flaxman, Turner (in his best day), Wedgwood, Rennie, Telford, Dodd, D. Stevenson, Watt (at the close of his career), Olynthus Gregory, Tredgold, F. Bailey, Ivory, Sir H. Davy, was in any way inferior to other times or nations "in the weightier matters" of life; and even the strange vagaries of the Pavilion, of All Souls', Langham-place, and the questionable repairs of our cathedrals, indicated that a profound

movement was then going on in the national mind, which has paved the way to much of the improvement of more modern times.

At the present day we are apt to treat with ingratitude the services rendered to the cause of architecture by the researches and the archaeological discoveries of the Restoration era; but a great portion of the credit awarded to the artists of subsequent times ought, in justice, to be awarded to those who collected—often at great personal risk—the elements of artistic education. Our own Aberdeen, Hope, Gell, Inwood, Wilkins, Cockerill, Donaldson, Pugin, Wyld, Britton, Daniel; the French Decau, Percier, Fontaine, Montigny, Clochat, Quatremère de Quincy, Raoul Rochette, Visconti, Dusommerard, Nodier, Mérimée, &c., had studied and reproduced the various forms of ancient art, and had called attention to those of the Middle Ages, of Egypt, and of India. The seed thus sown has yielded good fruit, but our debt of obligation to our predecessors is not the less great; and though the architecture of the period between 1814 and 1830 did not produce any buildings able to characterise a “style,” it rendered it easy for its successors to approach that desired consummation. In fine, this period was one of social and moral transition; for the conviction of the stability of old forms of law, philosophy, art, and even of religion, had been violently shaken by the events of the end of the seventeenth, and of the beginning of the eighteenth centuries; and men were anxiously examining the grave problems of man’s destiny here and hereafter, and the mode of organising society so as to allow him to work out that destiny in the freest and most satisfactory manner. The architecture of the period reflected truly this state of the public mind. It was essentially uncertain and tentative. All previous styles were tried in their turns, and their merits discussed, but little originality was introduced into the works of the architectural students. Rousseau said, that “quand on commence à raisonner on cesse de sentir;” and so it seems to have happened with the architects of the Restoration epoch, and their productions are more remarkable for learning than they are for fancy or for imagination, especially towards its close. At any rate the public monuments and the private constructions of this period indicate that a great problem was being worked out, and that the past and the future were arrayed face to face before thinking minds.

This was not the case only in the countries we have hitherto exclusively considered; for in the newly created kingdom of the Netherlands, and throughout Germany, the same uncertainty and the same evidence of aspirations after a more stable social organisation may be discovered. It is true that the Dutch had subsided contentedly into the sleepy indifference which has so strangely characterised them of late years; but the Belgians were beginning to shake off the incubus of the French occupation, and of the deliberate exclusion from the commerce of the world to which they had formerly been condemned by the jealousy of their formidable rivals of the United Provinces; and Brussels, Ghent, Liege, Antwerp, were beginning again to adorn and improve their town architecture. In Germany, the signs of activity in this field were more distinctly marked still, and the schools of Vienna, Berlin, and Munich, were earnestly striving to eliminate a style of their own, under the guidance of such consummate artists as Schinkel, Von Klenz, Knoblauch, Von Gärtner, Ohlmüller, Von Hübsch, G. Moller, J. G. Müller, &c. In some respects, indeed, the German Architecture of the Restoration epoch must be considered to be of a far superior character to that of any of the contemporary European schools, for it was bolder, more distinctly national, and more fraught with promise for the future, than they were; yet even at this time the cold pedantry and the dreamy mysticism of the German intellect could be discerned in the architecture of the various capitals; and there is a lack of spontaneity about the marvellous adaptations of the forms of antecedent art, to be discovered in the Aukirche, the Glyptothek, the Theatre of Mainz, the Altkirchenfelder Kirche, &c., which goes far to mar their effect. Of late years, indeed, German art has been singularly “bureaucratic” in its spirit, and it bears ineffaceable signs of the personal influence of the rulers of the day, and of the tyranny of schools; self-dependence is not a German virtue, and it would be but lost labour to seek for its manifestation in German art. As for “the geographical expression,” Italy, and as for Spain, there was so little national independence, and so little personal liberty in them during the period we have attempted to review, that they may safely be left out of account in the endeavour to discover the philosophy of architectural development.

HOUSES FOR THE POOR.

THE *Dunder Courier and Argus*, referring to the “Report of the Committee on Houses for the Working Classes, to the general assembly of the Free Church of Scotland,” says:—“There is a subtle sympathy between the mind and the body, by reason of which bad dwellings fix and perpetuate bad habits when they have been formed, and encourage their formation where they have not previously settled. All that is well known, and has been so from the time the subject was first investigated; and it is equally notorious that in every large town there are thousands of the working classes living in houses of the very worst kind. Old houses separated into apartments of two rooms or one, are the places in which they and their families are crowded like pigs in a sty, without the means of being clean or decent, much less comfortable; and there, beside the risk of moral degradation, scanty light, impure air, foul smells, and insufficient drainage, are standing invitations to physical disease. When the report says that these places are inferior to the wigwags of North American Indians, it does injustice to the red men of the New World by instituting the comparison. Nowhere, in the whole history of the world, have there been

known worse incentives or more powerful provocatives to vice, than are presented in the cities of to-day, and which form a part of what men proudly boast of as ‘civilisation.’ This is a state of things which must be remedied, or the consequences of which must be borne. There is nothing truer than this—that the working classes are the foundation of a State. On that basis all else must rest. The superstructure may be magnificent, but if the foundation rot beneath it, there is danger of its fall; and our working classes are exposed to influences which it would be folly to suppose are not sapping the sources of their powers. The question is, where is the remedy to be found, and how is it to be applied? The report points to the fact that it is not a remedy, but the reverse, to pull down the squalid buildings in which the poor are crowded. The only effect of that is to drive them into those which remain, and thus to render more intense the evil. Instead of more room, there is less, and the dens which were before too full, become fuller by the destruction of a part. If any good is to be done, before there is destruction, there must be construction. There must be new houses before the old ones are pulled down. Two difficulties here present themselves. In densely populated cities, where is the ground for new buildings to be had? That is a legislative question. If the ground were ready, who is to erect the buildings? That is a commercial question. We have only space now to say that the committee propose that Parliament should be applied to for powers to take ground for working men’s houses, in the same way as is done for the construction of railroads. As to who must build the houses, startling as it may appear, the report says, the working classes themselves.”

THE GENIUS OF TURNER.

A COMPLETE or final idea of the character and achievements of Turner’s genius I cannot profess to have formed. But I can say with decision, that I have discerned in him certain lineaments, vague yet unmistakable, of a gigantic mind, great in its simplicity, in its massiveness, in its sweep of comprehension, in its concentration of energy. Turner had none of your perked and paltry originalities about him. His power of plagiarism was as magnificent as Shakespeare’s, Goethe’s, or Carlyle’s. His real originality was no more doubtful than theirs. “He who has really caught the mantle of the prophet, is the last man to imitate his walk;” and he who catches the mantle without imitating the gait is the true original. Turner was the most earnest of scholars; he reminds you continually of other painters; but what he found brick, he left marble. As a realist, his grasp was irresistible, and will not now be questioned. But it is my deliberate opinion that as a poet he was more wonderful than as a realist. He rendered mountains and skies, forests and streams, as they had never previously been rendered. Every bone in the frames of the reeling giants whose weight steadies the earth, every wrinkle on their brows, every gleam of light upon their craggy forehead, he brought out with solitary power. The springing also of the bough and the sinewy strength of the stem, the wayward grace of the river and boiling torrent foam, the hot haze, swooning over the distances of midsummer, the scenery of the upper heavens, the lurid or fiery-red of stormy sunset, all were Turner’s own. But if he surpassed other painters in these and other provinces of pure realism, he surpassed them still more, as I said, in strictly poetic, in creative might. Who could select like Turner? You know that city and the scenery in which it is embosomed: but did you ever see it in that grandeur of attitude? Could any other painter have showed you it so? You would say cities and mountains were proud to sit to their great portrait painter, since none could perceive like him their characteristic points, none could so elicit and combine their distinctive and contrasted beauties, none could let them so well be seen. Yet selection is by no means the only power of Turner. Taste might go far to impart or regulate a power of selection, but the sovereign imagination alone could give the deepest poetry that dwells in Turner’s pictures. He seems, by life-long observation and musing, to have detected nature’s secrets of effect, her modes of contrast, her suggestions of thought: and his imagination struck out more grandly that at which she aimed. The strength and stateliness of the precipice, the majesty of mountain-shadow, the exulting magnificence of broad streaming light, the mysterious suggestion of infinitude by the steep and soaring line of mountain side, lost in the hanging clouds that seem to droop from the outer immensity, are all, as it were, vocal in a picture by Turner. The mountains are no longer dumb; Turner caught their inarticulate accents: and when he made them speak, all could understand them. This is not an easy thing to explain in words; but the universal sentiment as to prints from Turner proves that I am not alone in finding in his works the most poetic renderings of nature’s deepest expressions. A critic whose literary immortality is, I think, as secure as that of Spenser or King Colley, is severe upon Mr. Ruskin for demanding thought in pictures. The thoughts that are built up in the mountains are to that critic a great mystery. But if you ask me where you will find thought, poetry, invention, in landscape painting, I refer you to any volume of engravings after Turner.

I cannot fix upon any picture to illustrate the characteristics of Turner’s genius; and to more than one picture I cannot now refer. Let me take one almost indiscriminately. In Lord Ellesmere’s Gallery there is a large picture by Turner, painted evidently after the great Vandervelde in the same collection. I shall briefly compare the two.

The Vandervelde contains a considerable number of vessels. In front is a Dutch packet-ship, a gleam of colour on its sail from the dreary sunlight to windward. It mounts a broken sea, dipping into its foam, which dashes up over the bows. To leeward is a ship with sails clewed up, facing the wind.

The sky has two great banks of cloud, one of them again dividing into three tower-like masses, through which is shed a faint illumination of stormy sunlight. The sea in front is broken, yeasty, racing before the wind with fearful velocity. Look now to the Turner.

One vast bank of cloud, piled mountain after mountain, comes darkling over its waves, "cramming all the blast before it." Its rounded tops are steeped in the sombre light which appears in the Vandervelde. A gleam of the same rests on the sail in front. The whole under part of the great bank of cloud is black and thundery; beneath, the white waves are seen mysteriously rising and writhing. In the distance, a tall three-masted ship has furled all sail, and looks towards the blast. In front, two small vessels are lifted into prominence, running foul of each other; the one with canvas down, the other with bellying sail attempting to hold up to the wind. A sea strikes them both, dashing in wild foam over the bow of that one which has its sail spread. The waves in the foreground roll in one or two huge, angry ridges, the trough of the sea being filled with seething foam.

It is known that the picture by Turner is a companion to that by Vandervelde, and was a direct attempt either to imitate or to grapple with it. But mark how the conception, or rather conceptions, of Vandervelde, gain from the touch of Turner. The forms of the Dutchman's picture seem to have been dissolved or sent apart, and again brought together, into grander, simpler masses, at the word of a mightier imagination. Vandervelde's sea is covered with ships: only one or two break the loneliness and gloom of Turner's. The sea of Vandervelde is chopping and gusty, a broad plain of countless equal waves: one or two mighty ridges, with millions of wavelets in their hollows, occupy the front of Turner's. But the alteration in which the master mind and hand are most signally displayed is that passed upon the clouds. These all come together in Turner's picture; no division breaks the unity of the simple, overpowering mass; it rolls on there, dark, heavy, towering, majestic, in the grandeur and terror of tempest.

It could, I think, be distinctly proved, that a change, similar to that observable in Turner's treatment of Vandervelde's subject, was effected by him in all that he made, by earnest study, his own. The conceptions of other artists I compare to the many hills, interesting, varied, beautiful, of the newer geological formations. They may be the picturesque crags of the limestone, they may even be the jagged erests of the metamorphic hills; but they are comparatively low and comparatively many; the imagination of Turner, working from lower depths and with mightier power, upheaved the central ridge, the primary mountain chain, rising above all the rest, unapproached in height, and unbroken and alone in majesty. Composition becomes, with him, vital artistic unity; prettiness becomes noble symmetry and proportion; beauty becomes sublimity. I think I can admire the grace and elegance, the liquid sky and limpid water, the ordered pillars and dignified fronts, of Claude. But my perception of the fact that a precipice is more majestic than a palace gable, is hardly more distinct than my perception of a greatness and majesty in the forms of Turner totally absent from those of Claude. The latter is to the former as Pope was to Homer. And this I say while aware of the historical fact that Turner studied Claude with tears of despairing admiration in his eyes.—*Bayne's Essays.*

TASMANIAN TIMBER.

THE visitor to the International Exhibition cannot fail to observe, in the Central Avenue, a very high trophy of Tasmanian timber, which the Commissioners of the Exhibition for Tasmania have placed there as a specimen of the different kinds of wood grown in that colony. This structure was designed by Mr. George Whiting, Secretary to the Tasmanian Commissioners, to illustrate two important branches of the local industry, viz., the abundance, variety, and lasting qualities of the timber, which may prove acceptable to ship and other builders, and railway contractors; and, also, illustrate the peculiar adaptability, from their beauty of colour and marking, of the Tasmanian cabinet woods for the general purposes of ornamental furniture.

Mr. Whiting, who has compiled a brochure upon "The Products and Resources of Tasmania, as illustrated in the International Exhibition," says:—"To render this trophy a temporary museum of the more useful Tasmanian woods, specimens have been procured from the oldest public buildings of the colony, each of which is fully labelled, and will tell its own tale. The Old Gaol and the Old Court House of Hobart Town have furnished sleepers, door-posts, flooring-joists, boards, window-lintels, and architraves—of Huon pine, blue gum, and stringy-bark—which are as sound as when built in forty years ago. These relics of the past, had they power of utterance, might relate legends of human trial, suffering, and adventure of early colonial days, which would now be deemed incredible. But the evidence which they offer of their own durability must be taken as incontestable and complete. Nearly all the timber of the Old Hobart Town Court House has been found to be sound, and has been used in the erection of the New Post Office just completed on the same site. But the builder and the railway engineer may ask, 'Will Tasmanian timber resist equally well the atmospheric influences of the open air?' The naval architect will enquire into its 'behaviour' under water. Let the old piles, and planks, and posts, in the trophy supply the answer. Some of these old piles, which have been split down longitudinally in order to facilitate inspection, have been partly submerged daily, as the tide rose and fell, for periods up to twenty-one years, whilst forming part of the wharves of Hobart Town. Blue gum and other planks from the Wharf Platform will show their power of resistance, for the same period, of copious showers, hot sunshine, dry winds, and heavy traffic. Other material witnesses to the durability of Tasmanian wood have

been summoned from a colonial-built vessel, which has been stranded for fourteen years, in the shape of planking, timbers, trunnels, &c., which also fully attest this fact. A Tasmanian schooner, built of blue gum—the Flying Squirrel, 97 tons—has twice been thrown by the surf above high-water mark—and on being got off did not exhibit the slightest deflection in her lines, or a sprung trunnell, and has never even required to be pumped since undergoing this severe ordeal. Veteran posts from the earliest fences of the colony, of peppermint, and other woods, which have stood faithful sentinels over the crops and herds of the settlers of the last generation, here invite inspection of their almost unimpaired condition. What further proof can be required of the lasting and useful properties of Tasmanian woods?

"That these woods, particularly the blue gum, may be seen in all conditions the ship-yards and coach-factories of Hobart Town have furnished specimens as usually seasoned imperfectly, and as seasoned carefully. The specimens of ship-timber, from Mr. Macgregor, have been ten years, and that from Mr. Ross has been twelve years, lying in an open ship-yard, exposed to all weathers. With these specimens of rough seasoning may be compared the blue gum plank of Mr. Burdon, coach-maker, which has been carefully seasoned under cover for seven years; and other specimens of Dr. Crowther's, which have been seasoning for ten years. This comparison will serve to show that much depends on the seasoning of the blue gum; that it is a most valuable wood when fairly seasoned, and that, even when roughly prepared, this wood is unsurpassed for all out-door purposes requiring strength and stability. Another variety of the Eucalypti—the gum-topped stringy bark—nearly, if not quite equal, to blue gum, and procurable in greater abundance, of a straighter grain, and of more free working character, has more recently become an object of considerable attention. Its durability and general quality are well illustrated by a plank, which, with the old piles, has been exhibited by Mr. Oldham, that has been in use twenty years in the platform of the Hobart Town wharf.

"The octagonal column is formed of eight spars of blue gum, stringy bark, white gum, silver wattle, blackwood, and sassafras. The eight sides of this column are formed, at the base, by eight large planks set on end, of blue gum and stringy bark, from Dr. Crowther's timber establishment, at Oyster Cove. The thickness of the trees from which these planks have been taken will be seen at once by persons conversant with timber. The heart of Tasmanian trees is nearly always unsound. In these planks, as in all planks used in the colony for ship-building, the heart is cut off, and the width of the plank shows the size of the tree outside of the heart. To show the length of which ship timber can be obtained, planks have been sent home of blue gum, measuring 90 ft., and of stringy bark, measuring 80 ft. in length, of equal width and soundness throughout.

"Samples of other ship timber form the base of the trophy, which is thus constructed:—Five planks (20 ft. long), of blue gum, stringy bark, blackwood, and myrtle; the two former being fitted for ship-building, and the two latter for cabinet work, are first laid down. Placed across these, are ship's keel-pieces (10 ft. long, squared), of blue gum, and stringy bark. Immediately on these lie, transversely, joists of stringy bark, covered with ordinary flooring boards of the same wood. The framework of the pedestal placed on this floor is composed of blue gum, white gum, and stringy bark. The joists, quartering, and flooring-boards of the pedestal-platform are also of stringy bark. The centre piece of the spiral staircase is formed of a spar of plain Huon pine, the stairs being made of this free-working and almost imperishable wood. These samples will show what Tasmania can supply of plain timbers. Of large ship's knees—the want of which has even caused a modification of British naval architecture—an unlimited supply can be obtained from Tasmania, where the stumps of the large trees which might supply them are left to rot after the tree has been cut up. These are also shown, in the angles of the pedestal frame, of various conditions as to seasoning. A large blue gum knee, and also a blue gum crook, have been exposed to the open air nearly ten years, in the ship-yard of Mr. McGregor. In other angles of the frame are three very fine ship's knees from Tasman's Peninsula, exhibited by Mr. Boyd. There are also three smaller knees, a blackwood crook (for curved bannister work), and a fine Huon pine knee, in other angles of the trophy. In the interior of the pedestal are also some railway sleepers of blue gum and stringy bark, and pieces of white gum or gum-topped stringy bark, 12 in. by 6 in., 12 ft. in length, contributed by Dr. Crowther, from Oyster Cove, and by Mr. James Boyd, from Tasman's Peninsula; together with some sleepers of blue gum and peppermint wood shown by the Commissioners. The split palings and roofing shingles here displayed are also fine specimens, varying in length from 5 ft. to 15 ft., and in breadth from 6 in. to 24 in. These are specimens of the ordinary splitting qualities of swamp gum, which wood is valuable for this purpose, but is never used for any other. A longitudinal section of the swamp gum plank, from Port Arthur, exhibited by Mr. Boyd, will serve to show the extraordinary length and size of Tasmanian timber. The plank from which this section was taken measured 230 ft. in length. No available ship could be got to take it to London whole. The section has consequently been divided into 20 ft. lengths, in such a way that the brand cut across shall in each case bear evidence of the former connection of the pieces severed. These large specimens, and some others which could not be sent in time, prove that Tasman's Peninsula, with its tramway and excellent harbour at Port Arthur, and its large forests of these valuable timbers, is well calculated for a timber supply station to the imperial dockyards in England. The finest specimens of ship's knees are all from Port Arthur, which, together with Dr. Crowther's establishment at Oyster Cove, have supplied nearly all the best shipping and railway timber now exhibited."

THE SCULPTURED AND CROSS STONES OF SCOTLAND.

THE subject of the Scottish Sculptured Stones is one of surpassing interest, from the mystery in which the date of their erection, the people by whom they were erected, and the meaning of the symbols occurring upon them, are shrouded. The symbol of the cross, indeed, which we find so constantly recurring upon them, and in one instance, at least, a representation of ecclesiastics bending in adoration before the chalice and the consecrated host, point them out as relics of a people to whom the religion of the Crucified had been proclaimed. The nature of the sculpture also, especially what has been called the Celtic knot-work, corresponding as it does with the style of advancement to which the arts and sciences had attained in other things, and with the style of the illumination of several Irish manuscripts of the time, points to the period between the seventh and tenth centuries, as that during which they were erected. This knot-work (says Wilson in his *Archæology*) is to be found on the sculpture, the jewellery, the manuscripts, and the decorated shrines and book-cases of the early Irish Christian art, and has been perpetuated almost to our own day on the dirks of our Scottish Highlanders.

But the symbols which are sculptured upon them have as yet defied the investigations of the archæologist. We can decipher the hieroglyphics of Egypt and the cuneiform inscriptions of Nineveh and Babylon, but we have not been able as yet to discover any satisfactory key to the meaning of those strange mysterious symbols on our Scottish stones. They occur so frequently as to preclude the idea of their having been the result of chance, and the style of their execution is so varied as to do away with the notion of their having been the production of any particular artist. Besides the cross, the most common symbols are the crescent and an ornament like a pair of spectacles, both of which are represented, sometimes with and sometimes without a sceptre, a mirror or *speculum*, a comb, a horse-shoe figure, and a serpent sometimes with and sometimes without a sceptre. The arrangement is not the same in any two stones, which leads, perhaps, to the supposition that a difference in arrangement implies a difference in the meaning intended to be conveyed.

Besides these symbols, the stones are often engraved with representations of personages and events. We have warriors on horseback and on foot, armed with sword and spear, battle-axe and shield. We have priests and monks, harpers and harps, processions and battles, chairs and war chariots, bows and arrows, horses and dogs. On one monument only is there the representation of a boat, namely, on S. Orland's stone, near Glamis. These stand out on the moss-grown stones, telling their tales of other times, telling us that our Scoto-Pictish ancestors were men of like tastes, feelings, and dispositions with ourselves, and testifying to the prevalence of a degree of civilisation, which, but for those representations, we should scarcely have expected.

It is very interesting to compare the representations which they give of animals which are indigenous to Scotland with those inhabiting foreign countries; for whilst the former are in general executed with considerable accuracy, mistakes are often made in the delineation of the latter; the elephant, for instance, being represented with hoofs like a horse in place of paws. Apes, monkeys, serpents, and even tigers are in general correctly executed, which shows, perhaps, that, whilst the means of transit then existing sufficed to introduce those animals into Scottish soil, there were no means of conveyance sufficient to transport the gigantic elephant, and that therefore the artist, in delineating the animal which he had never seen, but had only acquired the knowledge of from some rude sketch, or perhaps only from verbal description, fell into mistakes with regard to the form of some parts of its body. Indeed we are not left without trustworthy evidence of the intercourse of Scotland in early times with Eastern countries; for only the other year, amongst a hoard of coins found in Orkney, there was one of an Eastern caliph of the ninth century. The hoard is supposed to have been hidden by a Norse pirate in the tenth century.

Although we have not been able to read the language which the symbols express, we have perhaps advanced a step towards it, in being able to limit and define the district in which the stones on which they are sculptured occur.

The symbolic emblems occur much more rarely on stones between the Tay and the Dee than between the Dee and the Spey, and still more rarely between the Tay and the Forth. South of the Forth there are only two known to exist. One of them owes its preservation to its having been used as a lintel in a window of the church at Abercorn, the see of the Pictish Bishop Trumwine, of whom we read in Bede, and who, on the defeat of the Anglo-Saxons by the Picts, took refuge at Streannessaleh or Whitby. (Bohn's *Bede*, p. 224.) The other formed a foot-bridge in Princes Street Gardens, Edinburgh, but it has recently been removed to the Antiquarian Museum.

The crosses of Iona and the west coast of Scotland, bear a general resemblance to those in the eastern districts of the country, with such differences as mark them out as the work of another age and race. The crosses of Wales, Ireland, and the Isle of Man, also bear a general resemblance to the Scottish crosses, but though similar in some respects, the style of the crosses of each of these countries differs quite as much as one order of Classic or one style of Gothic architecture differs from another order or style. The crosses of Ireland and Scotland bear the greatest resemblance.

Sixty stones in Scotland have been found near ancient ecclesiastical sites. Excepting the mirror and comb, no symbolical figures similar to

those on the Scottish stones occur in any other country. The mirror and comb, however, are found in some of the tombs of the catacombs at Rome.

On two stones only do we find inscriptions in alphabetical characters, namely at St. Vigean's near Arbroath, and at the otherwise unsculptured stone at Newton Garioch. The inscription on the stone at St. Vigean's is in the same Celtic character as that on the early monuments of Ireland, and the more ancient monuments at Iona. There can be little doubt that it is the oldest piece of writing in Scotland, not excepting perhaps the ancient Celtic manuscript recently found at Trinity College, Cambridge, the Gaelic of which is supposed to be six or seven centuries older than any previously known to be in existence. So far as unobliterated, the inscription on the stone at St. Vigean's reads thus, *Drosten ipe Voret dt Forcus*, which Professor Simpson, who is now almost as famous for his knowledge of such subjects as he is for that of his own profession, translates — "*Drosten the son of Voret (or Feredith) of the race of Fergus.*" He has been enabled to translate it by referring to ancient Welsh or British rather than to Scoto-Celtic analogies, although it must be remembered that all these are but dialects of the great Celtic tongue. His translation is confirmed to a certain extent, by references to ancient Scottish histories.

The stone at Newton Garioch is inscribed in unknown characters. The late Professor Mill, of Cambridge, thought that they were Phœnician. Mr. Stuart, the author of the preface to the invaluable volume published by the Spalding Club, thinks he has discovered all the letters on pottery found by Layard at Nineveh. The only inference we can draw as yet with regard to these sculptured stones, is that they were peculiar to a people on the north-east coast of Scotland. — *The Scottish Ecclesiastical Journal*.

ST. PETER'S, ROME.

WRITING some days before the Canonisation Ceremonial, the *Times* correspondent at Rome says:—"Only a few days have passed since I sent you a description of the interior of St. Peter's; but I was not satisfied with it, and so I went down again on Friday morning to get materials for a better. On entering it, the impression of every one with any pretension to taste must be, I am sure, 'What labour has been taken to hide and destroy the effect of so much grandeur!' The first sight reminds one of the tawdry churches in Southern Italy, where paper and gilt and cheap drapery are used as substitutes for the creations of the sculptor and the painter, and I must confess to a feeling of intense regret at seeing this vast temple dwarfed in its proportions and muffled up in silk and cotton velvet. The façade of the church is not touched; but immediately over the entrance in the inside are the Papal arms on a shield, probably of paper, with the tiara above, and two archangels or genii of small proportions on the sides as supporters; crimson velvet and yellow hangings shroud the door. If you have ever seen St. Peter's you will remember the grand sweep there was from this point up to the *baldachino* over the tomb of the saint. The eye revelled and luxuriated in the mere spaciousness of the building, while the gigantic columns and the wide-spreading arches and the subdued colour of the grey marbles found a combination which awakened a sentiment of awe, and made one almost exclaim, 'Surely God is here!' All is now changed, for all is 'of the earth, earthy.' The arches are divided to admit of the introduction of pictorial representations of incidents in the lives of the future saints; and thus you can no longer see on either side the colossal works in sculpture which all but breathe, and secure to the minds who conceived them a greater immortality than that of canonisation. Above each arch is a picture, painted in distemper, of some incident connected with the saints. There is an explanation underneath, and then hanging draperies of yellow silk fall down to the ground; while over the upper part of the arch and underneath the picture is festooned crimson velvet. On each side of this central aisle or nave are five vast candelabra, which one might safely say are nearly 200 feet high, covered over with gilt, while three circles of candles are carried round them. In every interval between them are suspended gigantic cirelets, with several ranges of wax candles in them. St. Peter looks particularly small, for there is a want of elevation in the *baldachino* over his head, while the two mighty candelabra on either side greatly assist the effect of reduction; and now we stand before the tomb of the saint, which is surrounded by four of the same candelabra, encircled, like the others, with three rows of candles. Each transept on either side of the tomb is provided with twenty-nine of the candelabra and cirelets I have already described, and yellow and crimson hangings everywhere cover up miracles of genius. The Papal chair at the extreme end of the church is now a thing of cloth of velvet, the original chair having been removed; above it is a lunette representing the reception of the saints into Paradise; lights surround it, and rays of gilt dart out from every point about it. Portions of the side aisles are disfigured and laden and decorated in the same way. Yellow and crimson everywhere; pictures in distemper everywhere; every altar has one, and every picture is surrounded by candles, and every altar is shrouded in cloth, or cotton, or silk, or velvet. One could almost weep at seeing the tawdry rubbish which covers up precious marbles and priceless statuary, and pilasters and columns built for eternity; and Michael Angelo, Raphael, and Canova, and all the others who form the bright galaxy of genius that raised this magnificent temple, might almost rejoice if the fears of the authorities were realised, and the hangings were burnt down. When I have added that round the entire church, above the architrave, run two rows of candles, I shall have completed my report of this wonderful specimen of bad taste and of ingenious upholstery. In its *genre* it is marvellous, but it is a bad *genre*, and every one will, I am sure, be longing to see this stupendous temple restored once more to its simple grandeur.

Altogether, there are at least 100,000 lights, some assure me 150,000, and to give them full effect, every window is closed. Some apprehension is entertained lest this body of light may lead to an accident, and fire-engines are ordered to be in readiness. One certain result of all this muffling up and of blocking windows will be that one-third at least of the ecclesiastics who are entitled to attend the ceremonies will be excluded, while out of ninety Jesuits privileged to be present in private seats only thirty can be accommodated. Great disappointment is therefore felt in many quarters, for neither love nor money can enlarge St. Peter's."

CHURCH, CHAPEL, SCHOOL, AND OTHER BUILDINGS.

CHURCHES.

TOUCHEN-END, BRAY, MADDENHEAD.—This church has been lately consecrated. The buildings are erected upon land presented by Mrs. Newcome, and the church has been erected from a design of Mr. John Turner's, of London, by Mr. Robert Vickery, builder, Bray Wick, with funds supplied chiefly by Mrs. Levett and others. The church is entered through an oaken open-timbered and traiered porch, situate on the north side, toward the west end, and is 52 ft. 6 in. long by 21 ft. wide, with a chancel of 23 ft. by 11 ft., and is calculated to hold 186 persons (144 adults and 42 children). There is a bell-turret over the west gable. The style of the design is Decorated Gothic. The materials used for the walls are red Berkshire brick and Bath stone, with an open-timber roof ceiled between rafters, and tile covering. The sittings, altar table, altar rail, pulpit, reading and lecture desk, are executed in pitch pine. The greater part of the window tracery has been filled in with stained glass of a simple Gresaille pattern. The font, reredos, pulpit, lecture and reading desk, have been executed by Mr. White, of London; the other portion of the fittings by Mr. Mickley, of Bray; the stained glass by Messrs. Laver & Barraud, of London. Attached to the church on the north side is the robing-room, connecting the church with the school and dwelling; forming together the eastern and southern boundaries of a quadrangle. The new school-room is 22 ft. long by 18 ft. wide, with an open-timbered roof ceiled between the rafters, and calculated to hold 50 pupils.

ASPLEY GUISE.—A stained window, representing "The Adoration of the Magi," has recently been placed in the parish church of Aspley Guise, Bedfordshire, and is dedicated to the memory of the late Prince Consort.

WROTHAM.—The upper portion of this church is undergoing the work of restoration. This is one of the few churches in existence in which a churchyard pathway runs through the basement of the tower.

JARKHILL, HEREFORDSHIRE.—This church is about to be restored, and a great portion rebuilt, at a cost of £1,000. The foundation stone has been already laid. Messrs. Ainslie and Blashill, of old Jewry Chambers, London, are the architects, and Messrs. Nibbett and King, of Gloucester, the contractors.

NORMANTON, DERBY.—The parish church of Normanton by Derby has recently been opened for public worship. The new church has been erected upon the site of the old one; it was intended to have preserved and restored the old tower, but being found in a dangerous state it was removed. Sittings are now provided for 300 persons, and the plan shows a nave and chancel, with south aisle, chancel isle, and vestry. The internal arches and columns are of dressed stone; the nave and south aisle are paved with buff, black, and red quarries in patterns; and the chancel with Maw & Co.'s encaustic tiles; the pulpit of Derbyshire alabaster and marble. The sittings throughout are in open benches; these, with the remainder of the exposed woodwork, being stained and varnished. The new tower and spire rise upwards of 80 feet, and being situate on high ground, are seen for many miles round. The works have been executed by Messrs. W. & C. Bridgert, contractors, from a design by Messrs. Giles and Brookhouse, of Derby, architects.

ELLINGHAM CHURCH, CHATHILL.—This church, which has been re-built at the cost of the vicar, the Rev. Chas. Thorpe, M.A., is now reopened. The plan is cruciform, consisting of nave and chancel, and north and south transepts, with the addition of a porch on the south side of the nave, and a sacristy on the north side of the chancel. A square tower rises from the point of intersection, having closely embrasured parapets; and a quadrangular slated spirelet, surmounted by a vane. The Rev. Mr. Turner was the architect.

STOWE CHURCH, STAFFORDSHIRE.—A painted window is proposed to be placed in Stowe Church. The drawing of the window is by Messrs. Henton, Butler, and Bayne, of London, and the cost will be about £300. The whole of the chancel of this church has been lately restored, the ancient features of the building being retained.

FALSGRAVE, NEAR SCARBOROUGH.—A new church is about to be built at Falsgrave, Yorkshire.

WYRARDISBURY.—The parish church of Wyrardisbury has lately been thoroughly restored, the chancel and the nave arcades being the only portions of the old edifice that have been retained; the north aisle has been rebuilt, the old doorway therein (the only object it possessed of antiquarian interest) having been carefully copied. A new south aisle has been added. The nave, which was formerly covered with a plaster ceiling, is now, together with the north and south aisles, roofed over with handsome open timber roofs. The western gallery has been taken down, and the old west window opened. The church is now thoroughly re-seated with plain open benches, and the passages re-paved, and will be again open for service in the course of next month. The works have been carried out in a very satisfactory manner by Mr. Harley, of Slough, from the designs and under the superintendence of Mr. Raphael Brandon, who, some years back, rebuilt the adjoining parish church at Datchet.

SCHOOLS.

ST. PHILIP AND JACOB, BRISTOL.—These schools were formally opened on the 11th June. The architects were Mr. I. A. Clarke and Mr. E. W. Godwin, of Bristol, who were recommended by Mr. G. C. Street, F.S.A. The building, which forms one side of Mary Bush Lane, consists of three principal stories, with intermediate floors at two ends of the buildings for the teachers' residences. The girls' school is on the top floor; measures 70 feet by 20, with a class-room 20 feet by 14, abundance of light being provided on both sides by bringing the building out to the line of the street. The boys' school and class are both on the floor under, of the same dimensions; the entrance to the boys' school being at the Queen Street end of Mary Bush Lane, through a small play-ground or court, and the girls' entrance at the opposite end. The ground-floor is occupied by a committee-room, various courts, and rooms for the use of the teachers. The schools are arranged to accommodate 170 boys and 170 girls, the total cost of the erection being only about £2,000. The architects have been careful to avoid bringing any soft or light stone within the reach of the children. With this view they have constructed all the entrances in a novel and effective manner, by going away with all angles, and rounding the sides of the doorways, which are built of hard pennant stone. The contract was taken by Mr. R. M. Bryant, of Old Market Street, the sub-contractors being Mr. J. King, for the mason's work; Mr. Hill, for the tiler's, plasterer's, painter's and glazier's work; Mr. Tuekey, for the plumber's work; Mr. Leaman, for the iron work.

BRISTOL.—On Wednesday, June 18, some new schoolrooms were opened in Lower Street, Great Gardens, Bristol.

ST. GEORGE'S, EAST.—The new Middlesex Society's schools, recently erected on the site of those originally established in 1781, for the education of the poor in the principles of the Protestant faith, but which were found too small for the requirements of this populous district, were opened on the 17th instant, by the Lord Bishop of London. The new schools are calculated to hold about 200 boys and 200 girls, and were erected at a cost of about £2,049.

LEITH.—A new school has recently been opened in the fishing village of Leith, on the Essex coast. The building is capable of accommodating between 300 and 400 children, and is a plain and substantial brick edifice. Messrs. Habershon and Pike were the architects, and the cost of the building was about £700.

BUILDINGS.

MILFORD.—A large Malthouse, including engine-house, boiler-house, and workmen's cottages, is now in the course of erection at Milford Junction, abutting on the North Eastern Railway Line; it is one of the largest in the West Riding of Yorkshire, and when finished it may be said to be a first-class model. The proprietor is Wm. Naylor, Esq., the extensive maltster, of Leeds; the Architect, Mr. John Child, also of Leeds, and under his directions the works are being carried out by his assistant, Mr. William Henry Stead.

NEW POOR LAW OFFICES, DERBY.—The new building is situate in Becket Street, Wardwick, and contains on the ground floor a spacious entrance hall, with large archway leading to the principal staircase, in an inner hall. The exterior is built with pressed bricks and stone. The style of architecture adopted is Italian, and a successful attempt has been made to produce at once the effect of a public building limited in size, bold in design and detail, combined with elegance and simplicity. The front is 50 ft. wide and 35 ft. high; the centre, being recessed, a wing is formed on either side; the centre, containing principal entrance, is surmounted by curved stone panel, with descriptive inscription in raised letters and ornamental terminations. The parapet contains open stone balustrading on stone cornice. The upper windows have pilasters with carved capitals and deeply moulded circular architraves; also, open balconies supported on corbelled entablature; the whole facing of the lower part is of stone; the dressings to the lower windows, principal entrance, and angles are vermiculated with bold rusticated joints, the several key stones being richly carved. The front is enclosed with suitable iron palisading, with requisite gates and stone piers. The design selected in competition has been carried out by Mr. Dunsauty, contractor, under the direction of the architects, Messrs. Giles & Brookhouse, Derby.

RAMSEY.—*Mond's Herald* says that a lady resident at Ramsey is about to erect a commodious House of Industry, for the benefit of that town and the parish of Maughold, to serve as a monument to a noble brother, who, after having honourably served his country as the governor of a large dependency with integrity and noble disinterestedness, died on his return to his native country. The charity is already vested in trustees, who are in treaty for an acre and a half, or more, of land, on which to erect the spacious building.

BIRKENHEAD.—The new County Court which has been erected at Birkenhead was opened for business on the 17th instant. The building is purely Italian in style, and has a very light, handsome appearance, forming quite an ornament to the neighbourhood. It stands upon 2,141 yards of land, and has been built by Government, at a cost of £7,250; of which sum, £1,000 was paid for the land. The building has been erected from designs by Mr. Charles Reeves, Government architect, of London; and the contractor was Mr. Henry Fisher, builder, of Conway-street. Mr. Bethell was clerk of the works, under Mr. Reeves, the architect. The foundation-stone of the new court was laid on the 13th of November, 1860, by the judge, J. W. Harden, Esq.; so that upwards of eighteen months have been occupied in its erection.

FOUNDATION STONES.—The foundation stone of the new schools of the

district church of St. Andrew's, Croydon, was recently laid by the Rev. J. H. Randolph, rector of Sanderstead.—The foundation stone of a new district church at Luedon, in the parish of Widdicombe, was laid on the 9th inst. The church is to be built of granite stone, with windows and other architectural features in Bath stone; whilst the roof will be of open timber work covered with slates. The style of the building will be the "Early decorated Gothic," and will consist of nave, chancel, tower, and vestry, and will contain about 200 sittings. Mr. J. W. Rowell, of the Devon Estate Offices, Newton, is the architect; and Mr. Chudleigh, of the same place, is the builder.—The foundation stone of a new church, in connection with the Torbay and Brixham Mission, was laid on 24th May. The church will be 65 feet in length, 38 feet in width, and will have steeples 50 feet in height. Mr. Phelps is the designer and builder.—The foundation stone of a new Wesleyan chapel at Edgworth, was laid on Saturday last by James Barlow, Esq. The new building will be in the Gothic style of architecture, from the plans of Messrs. W. and J. W. Best, architects, Bolton. It will accommodate about 500 persons.—On Wednesday afternoon, June 18, the foundation stone of a chapel for the Bible Christians of Weston-super-Mare took place. The chapel, which will be in the Italian style, is designed to accommodate 250 persons, and the cost of its erection will be about £400, which, with £140 purchase-money for the ground, together with other necessary expenses, will make the sum total of £600 to be provided. The builder is Mr. Richard Lewis, of Weston.—The foundation-stone of a new north aisle to St. John's Church, Bovey Tracey, Devon, was laid on the 16th instant.—The memorial-stone of the Devonport, Stonehouse, and Cornwall Hospital was laid by the Earl of Mount Edgumbe, on the 17th instant.—June 14, the foundation-stone of a Primitive Methodist Chapel at Old Sherburn, Durham, was laid with the usual ceremony.—The foundation-stone of a new bridge across the Derwent was laid on the 18th of June. The bridge is to be completed by the 1st of November. The contract price is £492; and the contractors are Mr. Wm. Lyries, Crook; and Mr. Ayton, Thornley.—The foundation-stones of two new Primitive Methodist chapels at Froghall and Rocester, Staffordshire, have recently been laid.—On Whit-Tuesday the foundation-stone of a new national school was laid at Staunton, by Lady Lechmere. The architect is Mr. G. R. Clarke; the builder, Mr. J. Griffiths, of Eldersfield. The estimate for the schoolroom, class-room, and minister's residence, including all internal fittings, laying out the grounds, &c., was £630.

GENERAL ITEMS.

NOTTINGHAM.—The *Nottingham Guardian* says:—"It has been decided by the town council to construct the subterranean portion of the new street on the new London model—that is, to form a continuous culvert from end to end, the drainage underlying it, and receptacles being formed along the route for gas and water pipes. This large tunnel is to be constructed at the cost of the owners of property on each side of the street, who will have the option of inclosing and using the half opposite to their several premises, on condition that they allow access, at all proper times, to parties authorised to inspect, alter, or repair the culvert or any of the pipes. The main object is, of course, to obviate the necessity of having recourse to the expensive, obstructive, and often annoying practice of taking up the pavement of the streets."

THE ASCOT NURSERY GROUNDS.—The *Windsor Express* says that about eighty-four acres of the Kennel Allotment, hitherto yielding about £5 a year, which immediately adjoins a proposed hotel, has been leased by Mr. Standish, the enterprising proprietor of the Royal Nursery, Bagshot; and it will soon be converted into a capacious and, we doubt not, flourishing nursery-ground. Ultimately, as we are informed, the establishment will be entirely conducted here, instead of at Bagshot, this improvement realising the idea of converting a wilderness into a garden.

MEMORIALS TO THE LATE PRINCE ALBERT.—Subscriptions are being raised at Warwick by the Rev. Mr. Boudlier, vicar of St. Mary's, and other gentlemen, to erect a substantial memorial to the late Prince Albert.—The Cambridge memorial is to cost £2,000. The subscribers are to decide whether it is to be of marble inside the Senate House, or of bronze in front of it.—The *Sydney Morning Herald* says that meetings continue to be held in all parts of Australia in aid of the project for erecting a statue to the memory of Prince Albert, and a very general sympathy towards the object has been expressed.—Subscriptions have been raised for the commencement of an endowment for St. Thomas's Almshouses, Gravesend, as a local memorial to the late Prince Consort. It is intended to place a tablet on a conspicuous part of the building, to record the object for which the fund was raised.—The foundation-stone of a memorial to the late Prince Albert was laid on Monday week, at Burnstaple. The memorial, of which Mr. R. D. Gould is the architect, will consist of a tower, 60 feet in height, to be called the "Albert Memorial Tower," at the summit of which will be a four-dial illuminated clock, and, at the bottom, a drinking-fountain.

THE NATIONAL MEMORIAL TO THE LATE PRINCE ALBERT.—The architects who were consulted by the Queen's Committee have reported that, to carry out the frequently-expressed wishes of the Prince, they would propose the erection of a noble hall, as a place for art or social science meetings, to be built on the south side of the road opposite the proposed memorial, on the vacant ground at the back of the Horticultural Gardens. If this site should be approved, they would invite the individual efforts of the architect and the sculptor for its realisation. The memorial is proposed to consist of one or several groups of sculpture; and if placed in the open air, they must be of bronze; but if of marble, a building must be erected to protect them.

STATUE OF HALLAM.—Mr. Theed has just executed a statue of Hallam,

which is about to be erected in St. Paul's Cathedral. Somewhat above the life size, the historian is represented standing in his doctor's robes, pencil in hand. A happy thought has struck him, he wears a pleased expression of countenance, and while one hand has the pencil poised, the other grasps a manuscript volume in which to write. The lines of Hallam's face were a little hard, and the artist has happily softened them by the expression which he has put into them. The attitude is natural, and the drapery is cleverly handled. The folds are perfectly easy, and the texture is made palpable without any appearance of effort. Some other interesting works may be seen in Mr. Theed's studio, in the course of preparation—as a statue of the Prince Consort in Highland dress, intended for Balmoral, and one of the Duchess of Kent, intended for the mausoleum at Frogmore. In both great ability is displayed, while the appearance of the Highland garb in the one case, and of a modern lady's dress in the other, will awaken the interest of all who know how difficult it is to deal with drapery in sculpture.

PROPOSED FORT AT PLYMOUTH.—The Royal Commission on the National Defences having been requested to reconsider, in conjunction with other officers, the subject of the construction of a fort behind Plymouth Breakwater, a supplemental report has been presented, stating, in the first place, that a fort on or near the breakwater is required for the more complete command and protection of the Sound. It would also be in the best position for supporting floating defences, and for affording protection to any portion of our sea-going fleet seeking refuge under its guns. The next question was, on what spot such a work should be placed. Its erection on the breakwater itself is pronounced objectionable; indeed, the foundation could not be depended upon for a superstructure of such weight. The site recommended is the Shovel Rock, inside and near the centre of the breakwater, and as close to its inner slope as practicable. The rock is in every respect suitable for the foundation, and a fort in that position will not interfere with the anchorage of a single ship. Being protected from the wash of the sea, the lower tier of guns may be placed as low as the top of the breakwater will allow; and communication with the fort will be practicable in all weathers.

A NEW THEATRE ON THE RUINS OF POMPEII.—At the moment of the destruction of the city of Pompeii by an eruption of Mount Vesuvius in the year A.D. 79, a theatrical representation was being given in the amphitheatre. A speculator, named Langini, having taken advantage of that historical reminiscence, has just constructed a theatre on the ruins of the above-named city, the opening of which he announces in the following terms:—"After a lapse of eighteen hundred years, the theatre of the city will be reopened with 'La Figlia del Regimento.' I solicit from the nobility and gentry a continuance of the favour constantly bestowed on my predecessor, Marcus Quintus Martins, and beg to assure them that I shall make every effort to equal the rare qualities he displayed during his management."

A CONTRAST.—Mr. G. G. Scott, in his lecture on the formation of a national museum at South Kensington, on the 17th inst., referred to the first and last of his lectures delivered before the Royal Academy. "They were reported," said Mr. Scott, "in the *Builder* and *Building News*, in March and April 1857, and February 1860." The *Building News* acted honourably last week, by reporting Mr. Scott's words. The *Builder* acted otherwise, by distorting what the lecturer stated, and substituting the word "elsewhere" for the *Building News*. We suppose it must be gall and wormwood to our contemporary to know that another journal reports lectures, and gets honourable mention from the lecturers themselves.

A SNEERING EDITOR.—The last number of the *Builder* contains a short account of the Sturges Memorial at Birmingham. The account speaks of "Mr. Joseph Sturges, the Quaker, who it may be remembered was one of those sanguine gentlemen who conceived the idea of obviating the Crimean war, by going to Russia, and using their influence with the Emperor Nicholas to that end." Not another word is said about the life and labours of the eminent Birmingham philanthropist. Does the *Builder* think that it can snuff out the reputation of a great and good man with a sneer? For nearly a half a century Mr. Sturges was known as a large-hearted, active philanthropist. He took a prominent part in the agitations against the slave trade, slavery, and the Corn-laws. He was a perpetual worker and munificent subscriber towards reformatories, model lodging-houses, temperance and peace societies, and all public efforts to educate, elevate, and christianise the people. Should the editor of the *Builder* perform, during his lifetime, a tenth part of such useful labours as the late Mr. Sturges, the editor, deserve a memorial too.

THE ACCIDENT TO THE UNDERGROUND RAILWAY.—After many successive hours of unwearying labour, the engineer to the Metropolitan Board of Works, Mr. E. Cooper, assisted by Mr. Fry, has at length succeeded in a great measure in turning away the sewage of the Fleet Ditch from the extensive railway works at Copple-row, where the current, notwithstanding all the precautions that had been taken, was every hour doing more or less damage to the foundation of the brickwork in the immediate vicinity of the tunnel, as well as inside that admirable specimen of underground workmanship. Though the stream was not wholly controlled by the new dam on Tuesday night, its force has been materially diminished, and no further damage need now be apprehended.

IMPROVEMENTS IN LEICESTER.—The old East-gates, which have long been regarded as a nuisance and obstruction to the public traffic of Leicester, are entirely cleared away. This alteration will cost the Corporation £6,000; but the work has been urged upon them by many gentlemen, who proved, by statistics, that the East-gate buildings were really dangerous to life and limb.

THE MIDDLE LEVEL.—The dam, which has at last been successfully constructed, is found to work efficiently, the flow of the tidal waters into the drain having been completely checked. Every day this week the work has been further strengthened, so as to enable it to resist the pressure of the high tides which will again prevail to-day and to-morrow. The drainage of the flooded country and the relief of the drain itself is to be effected by twelve great siphons, each of 3 ft. diameter; and it is expected that in a few days the "Middle Level inundation," which has become almost as familiar in men's mouths as "household words," will be merely a matter of local history. If report, however, speaks truly, something more will be heard on the subject in the courts of law, as the sufferers from the calamity intend to obtain some compensation, if possible, from the Middle Level Commissioners.

CHIPS.

THE exterior of the ancient castle at Brechin, N.B., is now undergoing renovation.

Lord Dartmouth has made a munificent offer to assign, as a recreation-ground for the inhabitants of Westbromwich, a piece of ground adjoining the railway station, twenty-two acres in extent.

The Prince Consort Memorial Fund in Ireland has already exceeded £5,000.

It is proposed to build a new Cattle Market for Newcastle. The total sum required is about £5,000.

It is proposed to erect a Lunatic Asylum for South Staffordshire.

On the line of railway at present being constructed between Barnardcastle and Bishop Auckland a monster bridge is in course of erection, which, when completed, will be several feet higher than the High-level at Newcastle. The situation of the bridge is either on, or near Cockfield Fell.

Twenty-three pieces of china in the hall of the South Kensington Museum are valued at £37,000. They are marked "H." and "D."—the initials of Henry IV. of France, and Diana of Poitiers, and fifty-nine pieces only were made.

A drinking-fountain is about to be erected in Silver Street, Reading, by Mr. Martin H. Sutton.

The *Bristol Daily Post* says:—"We understand that Handel Cosham, Esq., of Shortwood Lodge, has purchased a piece of ground, near the Baptist Chapel, Thornbury, for the purpose of building a suite of Dissenting Free Schools, to which there is also some talk of a lecture-room being added. Mr. Cosham has also presented a considerable sum towards the building fund. The building will, we hear, be proceeded with shortly."

A memorial bust of John Locke, executed by Mr. Papworth, is to be inaugurated at the next Quarter Sessions of that county, in the shire hall at Taunton.

A new Philharmonic Hall, 28 ft. by 50 ft., has been opened at Ramsgate.

A renewal of divine service at the old church of St. Mary the Virgin, Dover castle, after the lapse of a century and three quarters, was, on Sunday, welcomed with considerable interest. This church has lately been restored.

A movement is on foot by the corporation of New York, to procure a plot of ground in one of the cemeteries in the vicinity of the city, where the bodies of all the New York Volunteers, who may die in defence of the Union, may be interred at the expense of the state.

The second and third *conversazione* of the present session of the Society of Arts, will be held at the South Kensington Museum, on the 9th of July and the 8th of October.

At the examinations for 1862 of the Society of Arts, two prizes were offered for free-hand drawing. The first one, of £5, was obtained by Mr. Isaac Holloway, glass painter, at Messrs. Chance's library, Birmingham; and the second, of £3, by Mr. Thomas William Camm, draughtsman, at Messrs. Chance's library.

The attendance at the International Exhibition on Tuesday was more numerous than on any day since the opening, the admissions for payment being 61,311; by season tickets, 4,260; total, 65,571.

A new Post Office at Perth, in the Italian style of street architecture, is now completed.

On Saturday afternoon last, an explosion occurred at the percussion manufactory of Messrs. Walker, Graham Street, Birmingham, by which six people were killed, and more than thirty were injured more or less severely, four of whom are not expected to recover.

An extensive fire broke out in Quebec on the morning of the 7th. 120 houses were destroyed in the St. Lewis suburbs. The buildings were chiefly of wood, and inhabited by mechanics.

The joiners of Bolton are on strike for the Saturday half-holiday.

It is proposed to erect a statue to the memory of the late Lord-Lieutenant of Devonport, the Earl Fortescue.

Correspondence.

THE SATURDAY HALF-HOLIDAY AND THE EXHIBITION.

Sir,—I hope you will continue to agitate the question of opening the International Exhibition on Saturdays as shilling days. For some time a praiseworthy effort has been made in and out of the metropolis to extend the Saturday half-holiday. And I am glad to say that from the time the idea was started in Manchester, some fifteen or sixteen years since, it has been making progress; and I know nothing more likely to promote the movement than opening the Exhibition for a shilling on Saturdays. It may be said that Saturday is an aristocratic day; that the upper ten

thousand delight to sport on that day at morning entertainments, at the Zoological Gardens, the Crystal Palace, and other places; and that it would interfere with an established habit to let the multitude come between the wind and their nobility on Saturdays. I answer and say, that it is getting an established habit for the *workers* to enjoy themselves on that day too; and let the lesser give way to the greater in this as in other things. I do not wish to interfere with the enjoyments of the aristocracy—neither do I wish the aristocracy to interfere with the enjoyments of the people. The rich and privileged may, if they think proper, make a select day of their own, say Wednesday, when they may have the Crystal Palace, the Exhibition, the South Kensington Museum, and other places, when there would be no fear of popular intrusion. Labour should have its half-holiday, and Saturday should be set apart for the purpose. It would in every way be promotive of the public good. The arrangement I recommend would be a boon to hundreds of thousands, and a disadvantage to no one. It would establish a good precedent, encourage a good movement, and benefit society. Why then hesitate for a moment in effecting the alteration?—A WORKER.

TENDERS.

WANDSWORTH ROAD.—For fifteen cottages, Wandsworth Road. Mr. Caesar A. Long, architect.

Greig	£1,675 0 0	Restell (accepted)	£1,432 0 0
KENSINGTON. —For repairs, Vestry Hall, Kensington.			
Cowland	£239 0 0	Crafer	£158 0 0
Cade	217 0 0	Woodard	152 10 0
Wheeler	190 0 0	Hunt (accepted)	148 17 0
Rhodes and Roberts	160 0 0	Hardman	160 0 0
Taylor and Sen	159 0 0		

SHEFFIELD.—For the erection of the proposed Methodist New Connection College, Sheffield. Mr. William Hill, architect. Quantities supplied.

Mycock	£5,000 0 0		
LOWAN NORWOOD. —For laying-out grounds, forming roads, terraces, and slopes, and drainage connected with the same; erecting a porter's lodge, and laying the corridors, &c., with tile pavement, at the Jews' Hospital, Lower Norwood, Surrey. Messrs. Tillott and Chamberlain, architects. Accepted tenders for laying-out grounds and the drainage.			
Winn	£650 0 0	For tile-paving to corridors, &c.,—	
For porter's lodge,—		Cannon	£125 0 0
Wills	323 0 0		

DALTON.—For alterations and additions to the English Presbyterian Church, Shrubland Road, Dalton. Messrs. Tillott and Chamberlain, architects.

Prince	£318 0 0	Fish	£230 0 0
Cannon	310 0 0	Wills	218 0 0

NEW WANDSWORTH.—For a pair of semi-detached villas, Park Road, New Wandsworth. Mr. R. W. Giblett, architect.

Hewett	£800 0 0		
--------------	----------	--	--

CITY ROAD, LONDON.—For bricklayer's work to houses in City Road. Mr. Caesar A. Long, architect. Accepted tender.

Beale	£230 0 0		
-------------	----------	--	--

NORWICH.—For the erection of a dining-hall, 70 ft. by 20 ft., at the Pauper Lunatic Asylum, Norwich, for the Norwich Court of Guardians. Mr. J. S. Benest, architect. Quantities supplied.

Wright	£167 10 0	Burrell	£149 0 0
Chapman	153 10 0	Youngs	147 10 0
Plummer and Bloom	153 0 0	Murray and Son	145 0 0
Greengrass	149 15 0	Leach (accepted)	139 10 0
Browne and Bailey	149 10 0		

HUNTINGDON CORN EXCHANGE.—The tender sent in by Mr. John Bird, of Huntingdon, for the erection of the above corn exchange, has been accepted. £1,280. Mr. Robert Hutchinson, Huntingdon, architect.

NEEDINGWORTH, HUNTS.—For restoring and reseating the village church of Holywell cum Needingworth, Hunts. Robert Hutchinson, of Huntingdon, architect.

Richardson	£989 17 0	Allen and Smith	£835 0 0
Bunting and Son	942 0 0	Mason and Smith	816 17 0
Saint	865 0 0		

LAMBROOK.—For alterations at Lambrook, Berkshire, for William Edd, Esq. Mr. F. Warburton Stent, architect.

J. Kirk	£1,344 0 0	Bowley (accepted)	£1,095 0 0
Nicholson	1,190 0 0		

HOLBEACH.—For the erection of two new wings to the Union Workhouse. The following are the tenders:—

Blare, Watlington	£1,500 0 0	Moore and Son, Spalding	£1,120 0 0
Worswick, Long Sutton	1,430 0 0	Gilder Holbeach	928 0 0
Howse and Son, Holbeach and		Clarke Henry, Holbeach	849 0 0
Long Sutton	1,162 13 0	Clarke Samuel, Holbeach	848 0 0

Mr. Samuel Clarke's tender for £845 was accepted. The architect's estimate was £850.

PLYMOUTH.—For congregational chapel and schools, Plymouth. Messrs. Paul and Ayliffe, architects, Manchester and Burnley.

Matcham, Plymouth	£9,445 0 0	Sawyer, London	£7,963 0 0
Southall, London	8,121 0 0	Finch, Plymouth	7,768 0 0

Mr. Finch's tender accepted for the chapel, which only is to be built at present.

KEW STOKES.—For the restoration of the Parish Church at Kew Stokes, Somerset. Mr. John Norton, architect.

Hughes	£2,045 0 0	Beavan and Son	£1,674 10 0
Marquiss and Munro	1,594 0 0	E. Streeter	1,680 0 0
Broad	1,989 10 0	J. Dimont	1,629 15 0
E. Lewis	1,870 0 0	F. Durke (accepted)	1,569 0 0

WHITECHAPEL.—For alterations to Messrs. Merry and Nutter's Premises, High Street, Whitechapel. Mr. John Hudson, architect.

D. King	£929 0 0	Read and Son	£874 0 0
T. Little	910 0 0		

LONDON.—For the erection of a warehouse in Wood Street, City, for Mr. Brett. Tillott and Chamberlain, architects. Quantities supplied.

Myers and Sons	£5,209 0 0	Wills	£4,825 0 0
Piper and Wheeler	4,593 0 0	Fish	4,696 0 0
Lawrence and Sons	4,553 0 0	Cannon	4,600 0 0
Ashby and Sons	4,575 0 0	Brass (accepted)	4,455 0 0

Hill, Keddell, and Robison 4,846 0 0 | | |

HAMPSHIRE ROAD.—For the erection of a new Congregational Church in Talmers Square, Hampshire Road. Including boundary fence.

Scrivenor and White	£5,991 0 0	Myers and Sons	£4,983 0 0
